SOME idea of the universal interest taken throughout Ireland in the forthcoming race is seen in the desire to secure July 2nd as a general holiday in Dublin. The Dublin victuallers have unanimously decided to co-operate with the Cattle Traders' Association of Ireland, in the endeavour to have the Smithfield Market closed on the day of the contest, and the market held on the preceding day. Attention has also been called to the fact that the date rather interferes with some Assize Courts, but whether legal machinery will be diverted, in order that the profession may enjoy this unique spectacle, remains to be seen. Local authorities are altering their day of meeting because of the race, and a general holiday appears probable.

A SPECIAL meeting of the County Down County Council has been held under the presidency of Mr. Thos. Andrews, D.L.

Ireland, it is hoped to capture considerable traffic between England and Ireland. While accelerated services have been developed on this side the English partners in the Irish railways have been absorbing local lines and steamboat services, so that the time is now nearly ripe for direct railway and steamer connections between London and the south of Ireland via the G.W.R.

As the "throughout" route between London and Queenstown is officially stated to be between forty and fifty miles less via Fishguard and Rosslare than via Holyhead and Dublin, it is obvious that the new route threatens to affect the London and North-Western Railway Company in all classes of traffic, even the American mails. There is plenty of evidence that the London and North-Western have realised this—a fact brought prominently to the front by a writer in the "Manchester Guardian," who points out that the original line from Rosslare formed a good connection with the Dublin, Wicklow, and Wexford Railway, and thus might obtain access to Dublin, the London and North-Western some time ago sought powers to subscribe to the funds and guarantee the interest and dividends of the Dublin,

Wicklow, and Wexford Railway, and to control the appointment of some of its directors.

The London and North-Western Company have for many years controlled the greater part of the traffic from England to Ireland, but the recent development of competitive routes makes it certain that the former practical monopoly will soon cease. The Stranraer and Larne route is shared with three other lines on this side, and will now be controlled largely by the Midland Railway Company (as owner of the Belfast and Northern Counties) on the other. The Barrow route and the new route by the Midland from Heysham are out of the hands of the London and North-Western Company. At Fleetwood they share with the Lancashire, and Yorkshire and the goods traffic from Liverpool is fiercely competed for by the three great companies forming the Cheshire Lines Committee, and by the Lancashire and Yorkshire Company, and is by no means sought in vain. To these competitors may be added the Manchester Ship Canal, with its three direct steamship services to Belfast and Dublin, one of which will be utilised for the conveyance of a large party of Lancashire motorists to witness the Gordon Bennett race.

Even for passenger traffic from the South and West of Eng-

SUPPLIES IN IRELAND.

THE Automobile Club of Great Britain and Ireland have appointed the Vacuum Oil Company, Limited, to supply lubricants to the participants in the races and officials engaged in directing the same. Supplies can be obtained at the following places:—

ATHY	..	Duthie, Large and Co., Foundry and Iron Works.
BALLYSHANNON	..	Lee, James, Cross Roads.
BANBRIDGE	..	Craig, J., 35, Bridge Street.
BELFAST	..	Anderson, W. J., 150, Shankhill Road.
"	..	Craig, D., 110, York Street.
"	..	Ferguson and McRea, 46, Victoria Street.
"	..	Forsyth, W. J., 162, Duncairn Street.
"	..	Ireton, R. W., Windsor Cycle Works, Lisburn Road
"	..	Gass, J. H., 81, King Street.
"	..	Mallon, T., Ann Street.
"	..	Mulholland, W., 12, Madrid Street.
"	..	Osborne and Co., 77, Donegall Street.
"	..	Pomeroy and Co., 429, Lisburn Road.
CARLOW	..	Coleman, A.

[Lawrence, Dublin.

land to Dublin the new Great Western route is not to be despised. But the London and North-Western will not be inactive. They have almost completed the widening the greater portion of their line from Chester to Llandudno Junction, and possess in their line from Euston to Holyhead one of the easiest and best-laid roads in the kingdom. The average speed of the down Irish mails is only 48 miles per hour, whilst the North mail night express runs at 55 miles per hour, and the express steamers from Holyhead are quite capable of considerably shortening the time of the passage.

At the present juncture the matter is of particular interest, as there is no doubt we are on the eve of a great revival of interest in Ireland as a touring country. The railway companies are all doing what they can for the convenience of motorists, and the experience they will gain during the next few weeks in handling motor-cars should enable them to further encourage that class of the traffic in the near future.

THE Earlsfoot Terrace rink, at Dublin, will be a favourite rendezvous, less than half-a-mile from the Shelburne Hotel, which will be the headquarters of the A.C.G.B.I.

DUBLIN	..	Higgins, R. L., Motor Garage, Harry Street.

WATERFORD	..	G. White and Sons; Henry Bell.

THE CIRCUIT DES ARDENNES.

CONSIDERABLE excitement prevailed at Bastogne last week-end. Cars were arriving in a continuous stream ready for the weighing-in, which took place in the station yard on Sunday morning. In order to prevent all chance of accident it was decided to run the race in sections, the big cars being despatched over the 85 kilometre course at daybreak on Monday morning. Out of the fifty-eight entries only twenty-seven started, out of which but eight completed the six rounds of the Circuit before the control was closed. The English drivers included J. Lisle (Star), Jarrott (De Dietrich), S. Girling (50-h.p. Wolseley), and Callan (50-h.p. Wolseley). The fastest time was made in the first round, it being covered by Baron de Crawhez in 56 min. 40 sec. Terry (Mors) and Lisle came to grief at the same turning at Longlier, Lisle's mechanic having his leg broken. The second round saw the falling out of Roberts (Prunel), Loste (Boyer), Gabreau (Boyer), Caillois (Serpellet), Giraud (C.G.V.), and Vanderbilt (Mors), owing to various causes. In the third round, Heath (Panhard) and Duray (Gobron-Brillie) fell out. In the fifth round, Jarrott (De Dietrich), the winner of last year's Circuit, had to give up owing to tyre troubles, as

LIGHT CARS.

	H.	M.	S.
1 Baras (Darracq)	6	30	28 2.5
2 Tavenaux (Gobron-Brillie)	6	50	1 1.5
3 Cagno (Fiat)	7	6	50
4 Osmond (Darracq)	7	16	30 2.5
5 Hemery (Darracq)	7	33	48
6 Journu (De Dion)	8	2	10
7 Bardin (De Dion)	8	16	48

As we go to press we have received the following letter from Mr. E. Lisle at Neufchateau, giving the particulars of the accident to the Star Car :—" We should like the actual facts concerning the doings of Mr. Cordingley's car in the Ardennes Circuit made public, as in all these events many wild and absolutely unfounded rumours are spread. Our number was 37; Mr. J. Lisle driving, and Mr. Prew, the works manager, mechanic. Splendid progress was made, the car overhauling several large vehicles in fine style, and no better running could be wished for, as the car was good for an easy eighty miles an hour. Trouble was, however, in store for us in the shape of a very nasty accident. About two kilometres from Longlier there is an exceedingly awkward ascent, with three very dangerous turns in it. In rounding the second curve the speed must have been somewhat high, for Mr. Prew

Terry on the 80-h.p. Mors.

Chanliaud on the Serpillet Steam Racer.

THE CIRCUIT DES ARDENNES.

also Van der Poel (Pipe) and Chanliaud (Serpellet). The result of the complete Circuit is given below :—

HEAVY CARS.

TIME.

	H.	M.	S.
1 De Crawhez (Panhard)	5	52	7 3.5
2 Girardot (C.G.V.)	6	12	11 4.5
3 De Brou (De Dietrich)	6	23	29 1.5
4 Le Blon (Gardner-Serpellet)	6	31	3
5 Beconnais (Darracq)	6	48	5 3.5
6 Coppee (Germain)	6	57	14 3.5
7 Voigt (C.G.V.)	7	4	40
8 Guders (Pipe)	7	10	17 3.5

The honour of winning the event thus fell to Baron de Crawhez. He covered the distance (roundly 320 miles) in 5 h. 52 min., thus beating by a minute and a half the time made by Jarrott last year. Tyre troubles were the order of the day, due, it is said, to the roads having been wilfully strewn with nails.

Half an hour after noon the light cars were sent off for their race over the same course and distance. There were fifteen starters; including Barbaroux (Benz); the victor of the Huy meeting, Civelli de Bosch (Clement), and Lancia (F.I.A.T.), but only seven finished. The honours in this section fell to Baras on a Darracq. Appended is the classification :—

was shot out of the car and sustained a compound fracture of the leg. Mr. Lisle at once stopped, and carried his disabled mechanic close to the roadside, out of danger of other cars, and speedily obtained help. Consequently we abandoned the race."

THE Manchester Association of Engineers have paid a visit to several large works in Coventry. The party, numbering about eighty, journeyed to Birmingham, and thence to Coventry, where they proceeded in conveyances to the works of Messrs. Alfred Herbert, Limited, where they inspected the making of machine tools. A visit was afterwards paid to the factories of the Motor Manufacturing Company, Limited, and the Daimler Motor Company, Limited.

It has been decided to have the third run of the season of the North-East Lancashire Automobile Club to-day (Saturday), to Morecambe. This run will pass two notorious places for convictions against motorists, namely, Garstang and Lancaster. Certain firms in north-east Lancashire are to be communicated with, with a view of their appointment as official repairers to the Club, and Mr. Walmsley, of the firm of Walmsley and Yates, solicitors, Blackburn, has been appointed official solicitor to the Club.

CONTINENTAL NOTES.

BY "AUTOMAN."

THE Renault racing car driven by M. L. Renault in the Paris-Madrid race has been purchased by Mr. J. Vanderbilt for the sum of £3,000.

THERE has been a change in the driver of the Mors car for the Gordon Bennett race. For some little time things have not been running very smoothly between the Mors firm and their Paris-Bordeaux and Paris-Berlin champion of 1901. M. Henri Fournier's magnificent double performance of two years ago has not been since followed up by similar successes, and naturally both parties have been dissatisfied. M. Fournier says he is certain that the fault lies with the firm of constructors, whereas the makers throw the blame on the other party. Thus the breach has been getting wider and wider, until after Paris-Madrid it became impossible to bridge over, and so the Mors firm annulled their contract with M. Fournier, pay him a large indemnity, and name as their champion for the Gordon Bennett Cup M. Gabriel, who has lately been so successful in driving their cars to victory. M. Gabriel is a well-known figure in the automobile world. It will be remembered that he first came to the fore as the driver of Darracq cars, but went over to Mors during last year's racing season. The substitute for M. Gabriel, in case he should be ill or unable to compete, is M. Salleron, who drove the Georges Richard car in the Paris-Vienna race and a Mors car in Paris-Madrid.

SPEAKING of M. Henri Fournier, everybody knows that he has been for the last two years manager of the largest automobile garage in Paris, namely Paris-Automobile, which is situated very centrally in the Rue d'Anjou. This has been identified particularly with the Mors car, but now the exclusive agency for the Hotchkiss automobile has been obtained by Paris-Automobile.

IN the Paris-Madrid race it will be remembered that Mr. Stead's De Dietrich car came to grief whilst trying to pass M. Salleron on a Mors car. Mr. Stead said the blame for the accident rested on M. Salleron, and he laid a complaint before the racing committee of the A.C.F. M. Rene de Knyff, president of the racing committee, has written M. Salleron the following letter, which puts an end to this unfortunate dispute: "Sir, I have the honour to send you herewith a note of the decision come to by the racing committee, at its meeting yesterday, on the subject of the complaint made against you by the firm of De Dietrich. The president informed the commission of the complaint made by the firm of De Dietrich against M. Salleron, relative to the accident which occurred to Mr. Stead. The Baron de Turkheim and M. Salleron attended to give information to the committee on the subject of this accident. The committee, after having heard the Baron de Turkheim and M. Salleron, and after having taken cognisance of different depositions by witnesses, decided unanimously: That no infraction of the racing rules can be brought up against M. Salleron, and it only remains to regret the unfortunate accident which occurred to Mr. Stead."

ANOTHER echo of the Paris-Madrid race has been the news of M. Georges Richard, who has been brought back to Paris, and is found to be progressing favourably. There remains an injury to his right leg, which has been fractured.

THE Ostend week will begin on July 11th and finish on the 18th, and will consist in a trial of skilful driving and a battle of flowers, which will take place on July 11th. On July 13th there will be a mile race with a standing start. On July 14th there will be a race from Ostend to Ypres and back via Nieuport and Furnes. On July 15th there will be a kilometre race, and on the 16th a race over 10 kilometres. On July 17th there will be a race for tourist cars over 5 kilometres, and on the 18th the meeting will end by an exhibition of the cars.

ON Friday last week the Huy race took place in the Ardennes, and consisted of a kilometre race and a hill-climbing trial. The kilometre race reserved a surprise for the whole automobile world, for a light Benz car was the winner, accomplishing the distance in 30 and 1-5 seconds, at a speed of nearly 120 kilometres an hour, and beating Mercedes, Darracq, and Clement. The hill-climbing test, which followed the kilometre, only confirmed the victory of the light Benz car, which was driven by Barbaroux, for it came out also the winner of this event, beating all the other light cars by more than ten seconds, and leading the Mercedes by nearly three seconds. It is fair, however, to state, that in the hill-climbing trial De Caters on the Mercedes had to switch off his ignition in passing a carriage which was stopped on the hill at a turn; and it is also only fair to say that after the competition was over De Caters attacked the Belgian record for the flying kilometre, which he himself established on a Mors at Ostend with 29 and 4-5 seconds. On a 60-h.p. Mercedes he succeeded in reducing this record by 1-5 of a second.

THE Dutch Automobile Club has organised a reliability trial to be held from July 21st to 24th. It will consist of daily runs from Utrecht of respectively 190, 180, 145, and 110 kilometres, — a total of 625 kilometres.

It is reported that the Swiss Automobile Club has resolved to cancel all the races it proposed to hold this year.

THE *Daily Telegraph* has closed its correspondence on the Social Juggernaut. Its readers will thus be saved several columns of wearying reading.

MR. JOHN BIBBY died at Manchester Infirmary, last week, from injuries received by being thrown out of his motor-car, which collided with an electrical standard.

MR. JOSEPH H. CHOATE, son of the American Ambassador, and his bride have sailed for England. They intend to pass the first part of their honeymoon in motoring.

THE Artillery Wheels Works, Limited, has been registered with a capital of £3,000, and offices at 19 and 20, Holborn Viaduct, E.C.

THE Hill Climbing Contest of the Manchester Automobile Club advertised to take place last Saturday has been postponed until later in the season.

DURING the strike amongst the engine-men on the Victorian railways, which are exclusively in the hands of the Government, motor-cars were used to convey the mails, and the result has been to draw attention to the advantage of such a plan.

THE last official count of automobile clubs in the United States shows fifty-nine organisations in twenty-three states. New clubs are springing up almost every day, however, so that this list is subject to revision at the present time.

A MOTOR ambulance has been purchased by the Westinghouse Electric and Manufacturing Company, of Pittsburg, Pa., for use in their works at East Pittsburg. Hitherto the victims of accidents have been sent to their homes or to the hospitals on trains or in carriages, the delay causing much needless suffering. Now the automobile will be kept constantly in readiness.

FROM E. Gundlach's Verlag, Bielefeld, Germany, we have received a copy of "Das Motorfahrzeug und Seine Behandlung," a small handbook giving illustrations and descriptions in German of motor-cars and motor-cycles. The action of the four-cycle motor is explained by means of clearly-drawn diagrams, while other sections are devoted to carburation, ignition, silencing, etc.

WITH regard to the suggestion of the Manhattan Fire Brigade, referred to in our last issue, that provision should be made, where electric tramway and lighting wires are in use, for connections to enable electric fire-engines to be driven, Messrs. Merryweather and Sons, Limited, have sent us an illustration and particulars of an engine suitable for such a system made by them for Messrs. Siemens Brothers, of Woolwich, so long ago as 1891.

MOTOR-CYCLING NEWS.

BETWEEN August 10th and 22nd of the present year an important series of trials for motor-cycles will be held by the Auto-Cycle Club. The principle underlying the rules is that the trial is one of reliability. There are to be hill trials, and in these speed will be taken into consideration only for the purpose of a record on the certificate. There will be no special prizes, but certificates only, which will be divided into three classes, first, second, and third.

THE classes will be decided by the performances of the machines, and a record of the performances will be noted on the certificate of each machine, whatever the class. The cycles will not be under observation during the whole period, but they will be required to traverse sections of about ten miles long within definite limits of speed, and marks will be deducted for any excess of these limits. Speed in excess of the maximum allowed will subject the riders to disqualification.

IN arriving at their final verdict the Judges' Committee will take into consideration points in connection with the construction and behaviour of the cycles. The number of machines of any particular type and horse-power entered by a manufacturer or agents is limited to one, but six machines of different types

The power of the motors allowable will be about 3-h.p., the maximum bore and stroke not exceeding the square of $3\frac{1}{2}$ in. by $3\frac{1}{2}$ in.

EVERY competitor must ride the one machine throughout the race. Each machine must be efficiently braked and silenced, and must carry a cycle horn. A number of prizes are offered, while certificates of merit will be presented to all competitors covering the course in nine hours and under.

THE motor-cycle section of the Austrian Touring Club has decided to organise a 1,000 kilometre reliability trial for motor-cycles on the lines of that of the Auto-Cycle Club. Daily runs are to be made from Vienna.

THE Liverpool Motor Cycle Club had arranged a hill-climbing contest to take place up Parbold Hill on Saturday last, and a large crowd assembled there in anticipation of seeing the event carried out. Shortly after the proceedings had commenced, however, the police interfered and took the names and addresses of the captain and secretary for riding up the hill at too high a speed. Mr. J. Edge, the captain of the club, informs us that the police gave permission, or at any rate said they could see no objection to the members of the club riding up the hill, if they would start halfway up. But when the police noticed the pace at which the "Bat" could and did go up, they said the riders

Side and Rear View of "Liberty" Sociable Attachment for Motor Bicycles.

may be entered. The trial is open to tourist machines only. Racing machines will not be admitted. A class will be provided for private owners.

THE total mileage to be run is 1,034, divided into nine daily trips to Canterbury, Brighton, Worthing, Eastbourne, Folkestone, Basingstoke, etc. The entrance fee for the trials will be £10 per machine, £5 of which will be returned if the machine actually starts on the first day's run, except for the private owners' class, the fee for which will be £2 2s.—non-returnable, if paid not later than 12 noon on Saturday, July 11th. After that hour the entrance fees will be increased 25 per cent. per week. No cycle can be entered after noon on Tuesday, July 28th.

A NUMBER of motor-cycle races were run off on the Velodrome de la Cambre, Brussels, on the 14th inst., including a handicap, the final for which was a 10-kilometre event. The race resolved itself into a sensational duel between Andre and Coppin, the former using a $3\frac{1}{2}$ -h.p. Red Star motor-bicycle, known in this country as the Gamage, and Coppin a 6-h.p. machine. After a keen struggle Andre managed to win by a few yards.

PARTICULARS are now available of the first motor-cycle road race to be held in Australia, which is being promoted by the Dunlop Tyre Company. The race will be held from Warrnambool to Melbourne, a distance of 165 miles, on Saturday, August 22nd.

must not go up at that pace, as it was dangerous. Under these conditions the affair was abandoned.

WHEN in Enfield the other day we had an opportunity of inspecting the sociable attachment for motor-bicycles devised by Messrs. Graham Bros., of the Parade Motor Works, which has been taken up, and is now being put on the market by Components, Ltd., Birmingham. The "Liberty" sociable attachment consists of an arrangement by means of which a spring-supported and nicely-upholstered wicker chair can be coupled alongside any ordinary motor-bicycle in such a way that the riders sit side by side, thus adding considerably to the pleasure to be derived from the pastime. The chair is mounted on a steel tube framework having at one side a pneumatic-tyred wheel. This framework is attached to the rear fork, the back axle, the seat tube, and the forward tube of the cycle frame. From the illustrations it will be seen that the machine presents a very neat and practical appearance, while it is claimed to be practically free of side slip, and more easily steered than a motor-tricycle. The sociable can be attached or detached in a few minutes, the combination possessing the advantage of requiring only a 15s. licence.

PROF. HELE-SHAW, of Liverpool, was one of the vice-presidents of the "Transmission" section of the International Automobile Congress held at the A.C.F. in Paris last week.

THE "ORIENT BUCKBOARD."

QUITE a number of new vehicles designed to meet the demand for a popular-priced, two-seated motor-car have recently made their appearance, one of the simplest and most novel being the "Orient Buckboard," made by the Waltham Manufacturing Company, of Waltham, U.S.A., which is being introduced into this country by Messrs. H. G. Green and Company, of Tothill Street, Westminster. Fig. 1 gives a general view of the vehicle, which we had an opportunity of inspecting the other day. With the exception of the seating arrangement, it is almost identical with the motor quadricycle. There is n

FIG. 1.

frame in the ordinary sense of the term, the front and rear axles being connected by a "buckboard." The latter consists of two flexible hickory reaches, having a section of $1\frac{1}{4}$ by 3 inches, upon which are bolted cross strips of ash, forming a platform upon which the seat is mounted, resting upon rubber cushions. Between the front end of the platform and the forward axle are interposed two small leaf springs to absorb all vibration from the wheels, while at the rear it is connected rigidly to brackets on the rear frame. The motive power is supplied by a 4-h.p. air-cooled motor supported behind the rear axle. The engine has cooling flanges of corrugated copper, and can, it is stated, run at any speed from 250 up to as high as 3,500 revolutions per minute. The mixture is furnished by a float-feed, spray-type carburettor in conjunction with which is a pedal-operated throttle. The engine is geared direct to the rear axle in the same way as the old De Dion tricycles and quads, a clutch being, however, combined with the large gear wheel on the rear axle to give a free engine. The pinion on the engine shaft is made of rawhide and steel, this, together with the one on the axle, runs

FIG. 2.

in a gear box. The ratio of the two gear wheels is $7\frac{1}{2}$ to 1. The cycle-type road wheels are 26 inches in diameter, shod with $2\frac{1}{2}$ in. single tube tyres. The overall dimensions are 8 ft. 10 in. by 4 ft.; the wheel base is unusually long for so light a vehicle, viz., 6 ft. 8 in., the weight complete being 400 lbs. As will be seen, tiller steering is provided. In the construction of the Buckboard the aim of the makers has been to produce a motor vehicle with the least possible complication and with the fewest working parts

with which a practical conveyance could be made. It is under perfect control by the foot throttle and sparking advance lever, and can be regulated at will from four to thirty miles an hour on favourable roads. It is claimed to be able to climb all ordinary hills. Very steep short inclines can easily be ridden by speeding up the engine slightly before reaching them, and in an extreme case the rider can step off the machine and run it up with its own power, or help it if necessary. A feature of the vehicle is the arrangement to start the engine, this being done by a handled strap and ratchet device. To start the motor, the compression cock M (Fig. 2) at the top is first opened slightly to relieve the compression. The carburettor is then flooded by working the small pin up and down quickly a few times. The starting handle is next pulled up, turning the fly-wheels over, upon which the motor will start off running slowly. The driver then takes his seat and moves the clutch lever at his left hand slowly forward when he desires to start, at the same time giving the motor the necessary power by first advancing the sparking lever at the left of the seat and then pressing on the foot throttle. The machine is fitted with a powerful pedal-operated hand brake, and to stop it is only necessary to pull back the clutch lever and press the foot on the pedal. Altogether the vehicle is of an extremely simple design and should give a great deal of pleasure to those would-be motorists whose means do not allow them to go in for a more powerful, and consequently more costly, car.

SOME USEFUL NOTES.

THE throttle valves upon all steam cars generally require regrinding at regular intervals, and a few words as to the proper method of performing this apparently simple operation may not be out of place. A writer in the "Horseless Age" remarks that he has been in repair shops and seen supposedly competent men grinding poppet valves, whether for steam throttle or for the inlet or exhaust valves of petrol motors, holding one part in a chuck in the lathe and the other part in the hand, and running the lathe at a rapid rate, feeding the grinding material around the joint to be ground and bringing pressure upon the parts by the hand. This is decidedly the wrong way to accomplish the desired end, viz., a perfectly straight, true surface at the valve entirely free from rings.

THESE rings or grooves once started upon the seat and valve surface of any form of poppet valve, it is almost impossible to efface them by subsequent grinding, no matter however carefully done, and the only remedy would consist in machining the surfaces down true again, putting the valve into the lathe and turning up a new surface and using a special angular milling cutter or reamer for the seat. If a due amount of care is exercised in the grinding these expedients will never become necessary, and in grinding such valves the surfaces should be smeared with machine oil and emery, using about No. 90 to begin with for most work and finishing with flour of emery.

IN the case of a steam throttle one piece should be held in a vice and the other part turned by the fingers or a screwdriver, with the application of only moderate pressure, as too heavy pressure will be apt to produce the grooves above referred to. The parts should be turned first in one direction, then in the other, turning in one direction a little farther than in the other each time, so that the valve is continually revolving over all portions of the seat. As soon as the grinding material has ceased to cut—which can be felt and heard—the old material should be wiped off and replaced by fresh. In the case of a steam throttle, where both surfaces are of brass, it is a good plan to finish with grindstone grit. The ground surfaces should not be shiny when finished, but should have a dull, frosty appearance, and both valve and seat should show a uniform character of surface all the way round.

HERE AND THERE.

VISCOUNT BOYNE has ordered a 22-h.p. Daimler car.

THE Scarborough Town Council will not allow public motor-omnibuses to go over the Valley Bridge.

MR. A. R. ATKEY, hon. secretary of the Nottingham Automobile Club, has returned home after a prolonged tour in South Africa.

Mr. F. C. Stanley on the Stanley steam Car on which he covered a mile in 1 min. 24.5 sec. *Motor Age.*

A NEW pneumatic motor tyre, to be known as the "Autotyre," is about to be put on the market by Mr. Berne Nadall. We hope to give some details of it in an early issue.

THE Leeds Watch Committee have granted a licence for the running of a motor omnibus between the city and Stourton, a distance of about three and a half miles, for which a fare of sixpence will be charged.

THE Edinburgh Garage and Motor Company, Ltd., has been registered with a capital of £5,000, to carry on the business of manufacturers of, dealers in, and letters on hire of motor-vehicles of all kinds, and all parts and accessories pertaining thereto.

MANY of the motorists going to Ireland for the forthcoming series of events will welcome the treatise on Photographic Lenses published by Messrs. R. and J. Beck, Limited. This will be of service to amateur photographers, giving in a concise form much information not only as regards the functions and types of lenses but also as to their practical application in landscape and architectural work. The chapter with regard to the hand camera is particularly well done, and the table of speeds required for various subjects at different distances will be of value to the hundreds of people who will "snap" at moving automobiles.

THE scenery and history of the Midland Railway are well described by Mr. Alan J. Woodward in the comprehensive volume on that great organisation just published by Messrs. Bemoose and Sons, Limited. This is an illustrated volume of reference for travellers and traders, and is placed in the carriages of the Midland Railway Co., where it is frequently used by passengers to beguile moments that might otherwise become monotonously weary. The illustrations are capital, while the industrial facts scattered throughout its pages, as well as the historical information, are not only well set forth but are also accurately told. Lists of hotels and places of interest in the vicinity of great towns on the Midland system add to the attractiveness of the work, upon which the editor is to be congratulated.

SIR CHRISTOPHER FURNESS, M.P., has landed at Folkestone after a six weeks' automobile tour on the Continent.

THE speed of motor-cars journeying through the county of Fife is among the new subjects of study for the Chief Constable.

THE Cheltenham Automobile Club suggests that fines for excessive speed should be proportionate to the horse power of the automobile.

A PAMPHLET showing how to reach the Gordon Bennett course has been published by the "Irish Wheelman," and will be on sale wherever motorists congregate in Ireland.

IN consequence of the dust raised by motor-cars on Sundays, the district council of Sunbury have decided to have their water-carts out from 6 to 9 p.m. on Saturday evenings.

THE Onward Motor Works of Croydon are about to erect new works near the motor track at Purley. The premises will be open night and day for the accommodation and repair of cars.

ON the main road from the town to the racecourse at Doncaster, Messrs. W. E. Clarke and Company are now stocking the Gas Lighting Improvement Company's petrol as well as Messrs. Carless, Capel and Company's petrol and Pratt's motor spirit. They are in a good position to store cars, supply spare parts, etc.

"QUIET Holiday Resorts at Home and Abroad" is the title of a new book of more than three hundred pages just issued by Messrs. S. H. Bousfield and Company, Limited. It is a practical guide to the most charming resorts in the British Isles, and being supplemented by some suggested automobile tours will not be without interest to the motorist.

AT the Supreme Court at Christchurch, N.Z., Mr. Henry Rushton, an engineer, has claimed £300 damages from Messrs. R. Moritzson and Co., of Dunedin, for breach of contract for the building and equipping of a motor launch to run between Sumner and New Brighton. It was alleged that the defendants failed to supply particulars of the propeller and reversing gear, in consequence of which defendant lost the last summer season.

MESSRS. R. REYNOLD JACKSON and Co. have just introduced the Jackson Popular car illustrated herewith. As will be seen in general arrangement it follows standard lines. The motive power is supplied by a 6-h.p. De Dion engine. Three speeds forward and a reverse controlled by one lever are provided, the drive on the top speed being direct. From the gear box a cardan shaft and bevel gear transmit the power to the rear live

axle. The speed of the motor is regulated by a throttle valve, the latter being controlled either by hand or foot, the controlling device being so coupled up to the clutch and brake pedals that on either being used the speed of the motor is automatically retarded. The car has a long wheel base, the two-seated body leaving a large amount of space at the rear on which luggage can be carried or a detachable seat fitted.

LORD RENDELL has just purchased a 16-20-h.p. Rochet-Schneider car.

MR. O. SELBACH can supply single and double-cylinder Regal cars and four cylinder chainless cars practically from stock.

MR. E. B. MILBURN has a repairing shop opposite the Ailesbury Arms Hotel, Marlborough, and also keeps spare parts, etc., in stock.

THE Motor Cycling Club run on Sunday will be to Hitchin, the meeting place being Old Salisbury, Barnet, 11.30 a.m. Lunch at the Cock Hotel, Hitchin, 1.30 p.m.

THE rumours which have been currently reported in the press as to an order for one hundred automobiles for South Africa are entirely unknown to the representatives of the Colonies in this country.

AT Victoria Street, St. Albans, the New Century Motor and Cycle Co. have opened a garage and repair shop for motor-cars. They have a competent staff of mechanics, and are also in a position to supply spare parts, etc.

MR. T. THROUP, of Bradford, to whose excellent guides reference has already been made, sends a copy of his North Wales Cyclists' and Motorists' guide, which will be of service to all tourists in North Wales, as well as parts of Cheshire and Shropshire.

THE accompanying illustration shows the new gaiter which the Dunlop Tyre Company has perfected for lacing over bursts in motor tyre covers. The device is built up of rubber and canvas vulcanised together in a manner similar to that of the

tyre tread itself, and the eyelet holes are not only protected by brass, but pass through leather straps inside and out. The gaiter is made to suit tyres from 2½ inches to 5 inches in diameter.

MESSRS. CASSELL AND COMPANY, LIMITED, have issued a little handbook of photography which presents in a handy form nearly all that the amateur requires to know. It is written by Mr. Arthur Hands, an instructor in the art in some of the technical institutes in the eastern suburbs of London, whose practical acquaintance with the needs of novices has resulted in a book of utility as well as of interest.

THE inquests on the three victims of the accident at Bristol Post Office sports on 23rd May has been concluded. The jury found a verdict of "Accidental death," and added a rider that the accident was due to an error of judgment on the part of one of the riders; also that insufficient steps were taken to safeguard the public. It also expressed pleasure that the authorities would not sanction any more motor-cycle races, as the track is unsuitable.

THE Manchester Motor Transport Company, Limited, who have been contracting for the conveyance of cloth for a leading Bolton firm between Manchester and Bolton, inform us that the maximum number of trips possible has been 554, of which 518 were completed without any hitch whatsoever. A score of runs had to be abandoned, and on the remaining sixteen some delay was experienced. Thus 93.5 per cent. of the trips were a success—a fact upon which the Lancashire Steam Motor Company, the builders of the car, are to be congratulated.

PETROL manufacture is contemplated as an additional branch of business by the Scottish oil companies.

THE Metropolitan Committee on materials and means of paving the streets of London has elected Mr. A. C. Morton as its chairman.

THE chairman of the Bangor (Ireland) Petty Sessions has drawn the attention of the police to the speed of automobiles passing through co. Down.

MESSRS. VAN RADEN AND CO., LTD., Coventry, have just fitted up a new factory for the manufacture of all kinds of electrical fittings suitable for the motor industry.

THE Central Motor-Car Company, of which Mr. H. Cassell is manager, have opened a depot at 111, Bothwell Street, Glasgow, for the sale of 12, 16, and 24-h.p. "Cassell" cars and a 6½-h.p. two-seated voiturette.

THE Roots Oil Motor and Motor-Car, Ltd., have sent us copies of circulars they have issued, giving illustrations of their 4-h.p. and 12-h.p. cars, and 12-h.p. lorry to carry 25 cwt. The motive power is of course supplied by engines using ordinary petroleum oil as fuel.

MESSRS. HELY'S, LIMITED, of Dublin, have brought out an interesting series of picture postcards in connection with the Gordon Bennett race. Doubtless the automobile fortnight will lead to a brisk demand for these souvenirs, and Messrs. Hely are not only the first in the field, but have set a standard of excellence that will be hard to beat.

DURING the week from September 26 to October 1, inclusive, Chicago is to celebrate the 100th anniversary of the settling of the city and the establishment of Fort Dearborn. The celebration will be a most notable event in every way, and money is being lavishly expended to make it memorable. To local automobilists the item of most interest is that one entire day is to be given over to them, and the organisation of the plans for this day has been placed in the hands of a special committee.

MR. EDUARDO HIGGINSON, the Consul of Peru at Southampton, has sent us a copy of a large folding map of Peru he has just issued under the authority of the Peruvian Minister of Foreign Affairs. The back of the map is used as pages, on which is given a short description of the country, this including references to its geographical features, climate and resources, agriculture, commerce, industries, railways and means of communication, education, etc. The map is one which will be found useful by all interested in the country of Peru.

A PLEASANT run of the Yorkshire Club took place recently to the pretty little village of Ripley, which lies three miles beyond Harrogate on the road to Ripon. The meet of the members from the different towns was at Poole Bridge, on the river Wharfe, and the cars took the road via Weeton, Pannal and Humphrey Bank. Tea was provided at the Star Hotel and afterwards a visit was paid to the Castle grounds. The following members joined the meet:—Mr. and Mrs. Faiers (Darracq), Mr., Mrs. and Miss Armitage (Clement), Mr. and Mrs. Jessop (M.M.C.), Mr. and Mrs. Booth (De Dion), Mr. and Mrs. Whitworth (De Dion), Mr. and Mrs. Exley (Beaufort), Mr. and Mrs. Jones (Pieper), Mr. and Mrs. Firth (quad), Mr. Steele (Benz), Mr. Parker (motor-bicycle), and Mr. A. W. Dougill, hon. sec., 2-h.p. bicycle.

MESSRS. S. F. EDGE, LTD., have sent us a photograph of a 16-h.p. Napier which has been built for Mr. C. J. Glidden, of Boston, U.S.A., who is this year making his third European tour on a car of this type. The car has just been despatched to meet him at Liverpool, where he lands from New York. After the Gordon Bennett race Mr. Glidden will make for Norway, and from there he will try and go as far north as it is possible by motor-car to go. The car has 40-inch road wheels, and the tonneau will hold five people comfortably, besides spare tyres and dressing-bags. It has a top speed of 35 miles an hour, and will climb hills of one in four with full load. Special long distance petrol and lubricating tanks are fitted.

CORRESPONDENCE.

TREMBLER COILS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your issue of the 6th inst., page 275, I observe a note by Messrs. John Child Meredith, Ltd., stating positively that a trembler coil is necessary with a wipe contact, particularly with De Dion motors. I beg to say that such is not the case, as I have a De Dion motor, 2½-h.p., fitted on a little car, originally on a tricycle, on which I have fitted a wipe contact, practically similar to the old Benz system. I use the original De Dion non-trembler coil. This I find gives perfect sparking, if occasionally lubricated, and I would not go back to the De Dion contact breaker under any circumstances.

There is another small car also in this town (Weston-super-Mare), fitted with wipe contact and non-trembler coil, giving excellent results.—Yours truly,

ARTHUR J. CARY.

A MOTORDROME NEAR PARIS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I see from your very interesting journal that you have mentioned under "Continental Notes," page 305, about the motor track of Buzenval Park, close to M. Edmond Blanc's racecourse. I should like to draw your attention that I have not "unearthed" this estate, but am the owner since 1896. Thinking it was a suitable site, I asked several experts their advice, amongst others M. L. Serpollet, who found it would make a splendid racing track, with a straight mile for records, and contained gradients in certain parts equal to 10 per cent. and 14 per cent. The park is a seven-minutes' drive by car from the Bois de Boulogne. Car manufacturers tell me that it will be of immense help to them, as it will allow them to show their cars at work to the public, and that close to the gates of Paris.—Yours truly,

WALTER M. LANG.

MOTOR-CAR RACING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In the letter from the Duryea Motor Carriage Company in the last issue, they make a mistake in saying that we have learned nothing through the Paris-Madrid race. We most certainly have, or rather Panhard's have. For racing cars, and indeed all cars, they have discovered that an absolutely vertical engine is a necessity. Hitherto, in their 24, 40, and 70-h.p. cars, they have had no trouble regarding lubrication of the cylinders. But their 1903 racing cars had engines that were sloping forward, thus allowing more room for the flywheel. For the first time the cylinders on the Panhard cars did not get proper lubrication, proving that Panhard's made a big mistake in not sticking to last year's vertical engine. If it had not been for motor racing we should still have 8-h.p. cars, weighing about one ton, with a top speed of about fifteen miles per hour, tube ignition, solid tyres, tiller steering, and many other things of the past. And yet people say racing has done nothing for the motor industry!—Yours truly,

J. C. NIXON.

COST OF UPKEEP.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a contrast to the experience of "cost of upkeep" which Mr. James Burns gives by letter in your last issue, your readers might like to have mine with a 6-h.p. M.M.C., which I received in March, 1902. I have kept strict account of every penny it has cost me for the year ending March, 1903, together with particulars of the mileage covered. I employ no man. I covered 2,947 miles in the year, and it cost me £95. This does not include £12 damage by a sideslip, which the Insurance Company paid; but it does include £6 for such insurance, £117s. 6d. fire insurance, and £10 stabling. The actual cost of a non-capital nature, namely for repairs, petrol, stabling, etc., is £76 6s. 11d.—Yours truly,

G. ARTHUR WINGFIELD.

"POLICE TYRANNY."

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—May I bring before your notice what I consider is the most absurd and I think the worst method of trapping motorists, which has just occurred? Leaving Carnarvon, we saw no signs of police, but arriving at Bangor an officer in uniform stepped forward, while we were crawling in, looking for an hotel to dine at, speed about four miles, and asked for my name and address; he had no charge to make, but simply said that all cars were being timed on leaving Carnarvon, and if we had been going over the limit when the time was compared results would follow. In Russia and other countries such things are possibly done, but in England, where "all men are free," is such obstruction to be allowed?—Yours truly,

PETER FRANK, JUN.

MR. JAMES BURNS writes that the cost of petrol referred to in his letter last week as £35 should have been £85.

IN answer to "Novice," "W. R." writes:—"I think 'Novice' will find the fault in the sparking plug packing washer, compression causing air to pass through leakage and blow out spark. I found this often with a small 5½-h.p. car I had last year. Put in a new washer and try it. Tighten up well, and again tighten after first run."

POLICE TRAPS.

A NEW trap has been established on the Queen's Road, Weybridge

THE police have established a trap on the Christchurch side of Iford Bridge, on the road to Bournemouth.

THE Chief Constable of Sutton Coldfield has promised the local magistrates that he will give attention to speedy motorists on the Lichfield road.

SEVERAL traps are being laid near Wolverhampton. About half a mile before entering and also leaving Shifnal, and also near Penkridge, there are devices into which motorists have lately fallen.

CLAIMS FOR DAMAGES.

AN action was commenced in the Lambeth County Court against Mr. E. W. Hart, by Mr. Gautier, for damages alleged to have been received in consequence of Mr. Hart's motor-car having run him down in the Kennington Road. The case was heard last week before Judge Emden and a jury. Mr. Staplee Firth appeared for the defendant, who obtained a verdict with costs.

THE District Iron and Steel Company, Limited, of Smethwick, have been sued in the Birmingham County Court by Messrs. Crosbie, Marriner and Co., Limited, who sought to recover £23 7s. 11d. damages to the plaintiffs' weighing machine, caused through the defendants' servants drawing a motor-wagon on to it. The machine was smashed in December last by a load of iron on a motor-wagon. It was alleged for the plaintiffs that the weight of the motor-wagon and its load was too heavy for the machine. The weight, it was argued, was greater than that of ordinary traffic. The defence was that permission was given to weigh the load on the machine. The jury found for the plaintiffs for the full amount claimed.

AT Bristol County Court, before Judge Austin, an action has been brought by Messrs. Hope Brothers against Mr. H. E. Sharp, motor expert, to recover £23 8s. 4d., damage to a window by an accident alleged to have been caused by the defendant. The plaintiffs' case was that on January 10th the defendant was riding a motor-bicycle behind a van in Wine Street, and that the horse in the van became restive because of the noise of the motor. The defendant, it was stated, put on extra speed when alongside the horse, which swerved and bolted into the plaintiffs' windows. In giving judgment, his Honour said it was unfortunate that motor-cars should be allowed in a city like Bristol, but they were authorised by the law, and must be tolerated. A motorist had a right to use the highway, but, like everybody else, he must use it with reasonable care. He was of opinion that the accident was brought about by the negligence of the defendant, and therefore there must be a verdict for the plaintiffs with costs.

CLAIM AND COUNTER CLAIM.

IN the King's Bench Division of the High Court of Justice, the case of McWhirter v. the New Automobile Company and S. R. Bailey, the managing director of the company, came before the Lord Chief Justice and a special jury. It was an action by Mr. Charles McWhirter, of Watford, Hertfordshire, to recover £143 10s., which he had paid on July 2nd, 1902, as deposit on the purchase of a car for £430 10s. Plaintiff's case was that in the summer of 1902 his attention was called to an advertisement of the Miesse Steam Motor Syndicate, of Wolverhampton, whose show-rooms were stated to be at Cambridge Circus, Shaftesbury Avenue, London. On going to that address he found it to be the premises of the defendant company, whose manager, Mr. Bailey, he saw. The company appeared to be agents for the Miesse Syndicate, and he ordered a 6-h.p. car for £430 10s., paying £143 10s. as deposit, it being a term of the contract that the car should be delivered by the middle of August. The car did not arrive in London till November, when he refused to accept it and demanded the return of his deposit, which defendants refused to return. The defence was that the defendants were unable to obtain the car from the manufactory at Wolverhampton, and therefore could not deliver. They counter-claimed for the balance of the money due for the car—£287—and also damages for alleged libel, which they laid at £1,000. The libel complained of was contained in a letter written by plaintiff to the editor of a trade newspaper, but was not, in fact, published. Plaintiff denied that the statement complained of was libellous. After the plaintiff had been heard in support of his case counsel opened the defendants' case, but did not call evidence, and the jury at once returned a verdict for the plaintiff on the claim and counter-claim.

Where no alleged speed is given it is understood to be above the legal limit.
* Motor-Cycle Cases.

FURIOUS DRIVING CASES.

TWELVE motorists, convicted at Garstang (Lancaster) of furious driving, were mulcted in penalties amounting to £47a nd costs. The speed of the defendants, the police stated, varied from 17 to 32 miles per hour.

THERE was a heavy batch of summonses before the Guildford Court on Saturday last. Amongst them was Mr. E. Trier, who was defended by Mr. Staplee Firth. Four policemen were engaged on the trap, and the sergeant had resorted to the usual method of signalling and a stop watch. After a long conflict the evidence of the prosecution was so absolutely displaced that the Bench dismissed the case.

At Melbourne (Derbyshire) Petty Sessions, last week, Larcourts Henri, driver to Mr. Frank Lawson, was summoned for driving a motor-car at a greater speed than twelve miles per hour on Sunday, June 7th. It appeared that the vicar of Foremark (the Rev. Thomas Orrell) was taken ill by the wayside, and Mr. Lawson, who was passing in his motor-car, sent the defendant for the nearest doctor, who resided two miles away. When the doctor arrived Mr. Orrell was dead. Defendant said his instructions were to go as fast as he could, and as he had powerful brakes at hand he apprehended no danger. The Bench said they would deal with the matter leniently considering the circumstances, but, although a doctor was being fetched, the public had a right to be protected. They imposed a fine of 20s. and costs, in all £2 2s. 6d.

FREDERICK LANCHESTER was summoned at Birmingham for furiously driving a motor-car. Mr. J. E. Hill prosecuted on behalf of the police, and Mr. F. Smith defended. At the outset Mr. Smith said the summons could not have any application to the defendant, who appeared, as he was not the man who had committed the offence charged. Mr. Hill explained that Police-constable 66 A was on duty in Stephenson Place, and a gentleman came down in his motor-car towards New Street station gates at what was considered an excessive speed. The officer followed the gentleman and asked him for his name, and as the officer would prove, he gave the name of Frederick Lanchester. As a matter of fact the man in the car was not the man who now appeared in court, and whose name was Frederick, but one of his brothers named Frank. A summons was taken out against Frederick, and later was served on Mr. Frank Lanchester in Corporation Street, but he refused to accept it. It was subsequently taken to the works, and Frederick Lanchester wrote to the Chief Constable, sending it back, and suggesting a mistake had been made. The Chief Constable replied that as far as he knew no mistake had been made, and the matter went on. The Clerk (Mr. Barradale) asked if Mr. Frank Lanchester was in court, and Mr. Frederick Lanchester replied that his brother was away on business. Eventually, on the suggestion of the Clerk, the police decided to take out a fresh summons against Frank Lanchester.

CLUB NEWS.

EASTERN COUNTIES.

The second afternoon run of the Eastern Counties' Automobile Club took place at the Angel Hill, Bury St. Edmunds. In consequence, however, of the disagreeable weather, the members, who turned out and travelled as they pleased from different places, made straight for the yard of the adjoining Angel Hotel. The first to arrive were Mr. J. R. Egerton, of Ipswich, Mr. C. K. Moseley, and Mr. E. P. Ridley. Then Dr. Longhurst, of Melton, riding a "Rex" motor-bicycle, came upon the scene, and he was shortly afterwards followed by Mr. Edwin C. Sayer, Mr. O. T. Cook, Mr. A. Hackblock, and some motorists living in the locality. At Bury, Mr. Moseley (hon. secretary of the Club), received a wire from Mr. Robert Page, of Clacton, saying that he had got as far as Sudbury, but that as the weather was so bad he saw no pleasure in coming on. The combined run was from Bury to Diss; Mr. E. P. Ridley, the only member who seemed to know the road, acted as pilot, and the Norfolk town was reached about a quarter to six o'clock. Putting up at the King's Head Hotel, the party were there very well looked after. At Diss, the members of the Club were joined by Mr. W. T. Pretty.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be for the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

VOL. V.]

LONDON, SATURDAY, JULY 4, 1903.

[No. 226.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

BY the time these lines appear the great event of the year will have been won and our readers will know the possessor of the Gordon Bennett Cup for 1904. When we reached Ireland at end of last week we were at once reminded that the Emerald Isle is a watery one, and it seemed as though the waterfalls had commenced playing from the clouds. But by Sunday Ireland had changed her tearful mood and the sun came boldly forth, continuing to shine as though he recognised devoted worshippers in the ranks of the motorists. We are glad that motorists, as a rule, seem to have shown the utmost consideration for the people, and the only vehicular mishap that reached our ears in Dublin was one in which members of our staff figured unpleasantly. They took a trip on an outside car one evening, it collided with a kindred car and lost its footstool. Nobody was hurt, but the three passengers decided to keep to motor-cars in future.

Hotel Charges.

ALTHOUGH reason prevails in many Irish hotels, it must be confessed that some authentic cases of extortionate charges have reached our ears. One gentleman owning a house near the course although not in view of the road—asked twenty guineas for three bedrooms to be occupied the night before the race, and similar instances have been told elsewhere. And yet at two or three minor places we have found the charges most moderate and the attention all that could be desired. Verily the ideas of the Irish hotel proprietors are as changing as the clouds that ever seem to hover over the Wicklow hills, along which scores of motorists have gone these last few days to enjoy the scenery—so varied, so wild, and so delightful.

The Result of the Race.

SHOULD the result be declared on the day of the race, the hour will be late, and it will be a tribute to the careful work of the timekeepers and their auditors. Telegraphing just before we went to press our representative in Ireland gave the view of some of the French journalists that it might be Friday morning before the actual winner could be declared. This is regarded as all the more probable in view of the fact that extraordinary care in checking the times at various controls will be necessary.

Speed Trials in Lincolnshire.

AT an early hour on Friday, the 26th ult., Mr. D. M. Weigel, on a 80-h.p. Panhard, attempted to place the flying kilometre record to his credit. The event took place within easy distance of Lincoln, and several well-known Lincoln and Nottingham automobilists witnessed the three attempts made. The time for the first trial was 31 seconds, the second 28 seconds,

and the third 32 seconds. Mr. Weigel, on the second attempt, getting a good start, completed the distance in the marvellous time of 28 seconds. The timekeeper, was Mr. C. Perry, official timekeeper of the Nottingham Centre of the N.C.U., assisted by Mr. A. Aldam. The road was perfectly level and the distance accurately measured by Mr. W. Pare, surveyor to the West Bridgford Urban Council.

Proposed Legislation.

MR. SCOTT MONTAGU'S Bill to provide for the registration of motor vehicles has been printed and circulated. The Bill is intended to secure the numbering and registration of motor-cars, light locomotives, and such like vehicles, whose total moving weight does not exceed fourteen tons, or with a second vehicle attached does not exceed a total of twenty tons. A sum not exceeding 5s. for registration is to be paid to the county council in whose district the licence is granted, in addition to the ordinary duty, and the money is to be applied for the purpose of highway improvement. The fifth clause provides that the speed at which a light locomotive may be travelling shall not, irrespective of the other circumstances of the case, be a ground of taking proceedings against the owner or driver. Any person running a vehicle without it being registered is to be liable to punishment, and any person instituting proceedings against a wrong person is to be liable to pay the costs and expenses of the person so prosecuted. A right of appeal against conviction by local courts of summary jurisdiction is also given.

Overshooting the Mark.

REALLY the police are overshooting the mark, and it is time a limit was put to their questionable ways. All the way to Holyhead the roads were infested with constables behind hedges, trees, and anything that would cover their persons and schemes. On the approach of cars, they came into the roadway, asserted that great speed was being made, pointed to telegraph poles as the limits of measured distances, and threatened pains and penalties unless names and addresses were given. In fact, we have heard of so many promises of summonses being taken out, that only the more notable cases can be given in our list during the next few weeks.

Municipal Obligations.

THE suggestion recently made in these columns that local authorities should provide facilities for the refilling of the tanks of steam motor-vehicles has been anticipated by the Hartford (U.S.A.) City Council, which has equipped three troughs within its area for this purpose. Whilst the municipalities are doing much to make the roads fit for motor traffic, they must not overlook the fact that steam and electricity are playing a part in the development of the modern automobile. Hence the provision of water troughs for steam vehicles and charging stations for electric cars must be regarded as a part of the duty of every modern centre of local government

At Holyhead.

BUT the most flagrant case occurred at Holyhead, where a policeman visited the steamer questioning everyone having the appearance of a motorist as to the way he had come. At length he eyed one man with a lynx-like glance, and demanded his name and address. In due course the gentleman will be summoned for furiously driving a motor-car in a certain district—the name of which we refrain from giving for obvious reasons—and subjected to expense and inconvenience. The irony of the situation is disclosed when we remark that the victim of this new policy journeyed to Holyhead by train. Why not summon the engine driver, and harass the railway company? Surely here is a theme for Mr. W. S. Gilbert?

**The County
Councils
Association.**
FIVE

At a meeting of the Executive Council of the County Councils Association last week, Mr. Milnes Gaskell (chairman of the West Riding County Council) submitted a resolution urging the Government to immediately introduce a bill to deal with the question of motor-car traffic and ensure the protection of the lives of the public. As long ago as January of last year, he said, the President of the Local Government Board

the corps has now been approved by the War Office. It is on the lines of the service dress, with dark green cuffs and collar, the cap being of the present staff pattern.

**A Useful
Warning.**

THE Manchester Automobile Club has just issued the following notice to its members:—The Committee are specially anxious, in view of the approaching motor-car legislation, and of the present state of public opinion, that members should drive with the greatest possible care and consideration. The committee appeal to you to see that the speed of your car is reduced to a really low limit in meeting and overtaking traffic, in passing through populous places or villages, in approaching cross roads, and in rounding corners. The committee also remind you that the dust question is one of the main objections of the public to motor-cars. They, therefore, suggest that on dusty days, for this reason alone, speed should be lowered as much as possible in meeting or overtaking traffic, and in populous places. The committee believe that if self-restraint of this sort is practised by members, a better understanding will be arrived at between the public, the police, and the motor-car users, and that it will ultimately lead to rigid police supervision only being practised in dangerous places. On the other hand, if consideration is not

Photo by)

The Theatrical Ladies' "Motor Meet" at Weybridge.

[The Biograph Co

had favourably received a deputation from the association in reference to the matter, and had led them to believe that legislation would shortly be introduced, but nothing had been done. Lord Herries (North Riding) seconded the motion. Sir H. Fairfax-Lucy (Warwickshire) said the longer the matter was postponed the stronger would the legislation be when it was brought in, and he therefore advised that the Government should not be pressed too strenuously. The motion was carried, and copies were forwarded to the President of the Local Government Board, the Prime Minister, and the Earl of Camperdown.

**The Motor
Volunteer Corps.**

ENROLMENT in this corps, which has been doing good work lately, is proceeding very satisfactorily. The following members have been doing duty:—Mr. H. R. Mosenthal drove the officer commanding Royal Engineers, IV. Army Corps, to Hounslow and back on June 17th; Mr. F. A. Rodewald drove the officers commanding Royal Engineers, Home District, to Cooper's Hill College and back, for inspection of the battalion there, on June 17th; Mr. Oliver Stanton drove Lord Grenfell, the General Officer commanding IV. Army Corps, to Cowshot, near Brookwood, on June 25th, for manœuvres in connection with the militia brigade which is encamped there. The services of members of the Corps will be used to some extent in connection with the reception of the President of the French Republic on his approaching visit to the King. The uniform of

used, especially at the present time, legislation, that will spoil the pastime and injure the trade, is sure to result. If you have a paid driver the committee trust you will thoroughly impress on him the necessity for caution.

**Furniture Removing
and Motor Traction.**

AT the annual meeting of the National Yorkshire Removers' and Warehousemen's Association, held last week, the question of motor traction was mooted in the report of the hon. secretary in the following terms:—"It appears to me in a general way to be conceded that at no very distant date mechanical traction, derived from the application of electrical energy, must take the place of the present system of haulage. The motor steam van could be specially adapted to convey furniture from house to house over the country; which would necessarily dispense with railway transshipment and terminal charges of the companies."

**Motor-Cars in
Hyde Park.**

IN the House of Commons on Monday, Mr. Cathcart Wason asked the Home Secretary whether, in view of the speed at which motor-cars are driven through Hyde Park, he would authorise the police to prevent them entering the park until such time as the law is competent to restrain them. Mr. Victor Cavendish replied, drawing attention to the statement made in

Parliament last week, that the Government intend to proceed with their Bill for the regulation of motor traffic, and hope to introduce it this week. The First Commissioner is also considering, in concert with the police authorities, what steps can best be taken to regulate the speed of vehicles in Hyde Park, Constitution Hill, and St. James's Park.

In Rural Districts.

THERE seems to be another outbreak of motor-mania on the part of district and rural councils, and several resolutions have lately been adopted by these authorities urging limitations, restrictions, and hindrances to the development of the automobile. Away in Yorkshire there seems to be quite a plethora of interest in the subject, and hardly a local assembly of a dozen members has not adopted some motion of a retrograde character. The Settle Board of Guardians and the Bedale Rural Council have been particularly prominent in the matter. It is, however, gratifying to know that all Yorkshire bodies are not

every motorist there to be bound by the common law, a mark of identification to be placed on cars, and motorists, not to be regarded as endangering the public when no members of the public are present. The latter reference to the case of *Sutton v. Mayhew* will be appreciated by all motorists who will be glad when the present tension is removed and their rights as users of the road are legally recognised.

Water Ways and Motor Cars.

STRANGE though it may appear at first sight, there is little doubt that the coming of the motor-car may lead in some places to a resuscitation of the canal. Hitherto the policy of the railway companies has been to secure the canals for themselves, or to bring them completely within their influence. But the automobile offers a ready means for the transport of goods and merchandise that in conjunction with efficient waterways would restore prosperity to many a country district.

Barbaroux on the 60-h.p. Benz Parsifal Car on which he won the Huy Kilometre Race and hill-climbing trial and which he will drive in the Phoenix Park Speed Trials.

so inclined to revert to the usages of past ages, and the Doncaster Rural Council has been discussing the desirability of providing its highway surveyor with a motor-cycle for use in connection with his duties. The matter has been referred to the Highways Committee for further report, but that the idea should have been discussed is significant of much.

Motors and Men.

MR. NORMAN, M.P., is a persistent advocate of the motor-car, and in the "World's Work" continues to demonstrate his interest in the automobile. Like most Parliamentarians he has his own views as to the regulations to which motorists should be willing to submit, and prints a quintette of suggestions that may be useful as indicating the lines upon which the ultimate settlement of the problem will be based. Every professional driver will have to take out a license, the speed limit in towns to be ten miles an hour, no limit to be fixed for country districts,

Week-end House.

COMPLAINT continues to be heard in many rural districts as to the decay of the country. The saddler and harness maker who was once so familiar a feature, in fact, an essential factor in country life. The coming of the motor-car has re-arranged the economy of many of our villages, and unless the saddler is prepared to turn his attention to mechanical matters, he will find himself quite out in the cold ere many years have passed. It is satisfactory to find that other industries, such as coach building and hotel keeping, are rather more active to meet the newer demands of the age than are the class to whom we have just referred. On practically every main road rural inns and hostelries, whose glories seem to have departed, are rejoicing in the splendour of new paint and furniture. Hotel proprietors recognise that, although the motor-car may prove inimical to the interests of certain industries, it will be to their advantage, as well as to the welfare of the country generally. In connec-

tion with this, it is notable that the demand for "week-end houses" in the Thames Valley, and in the home counties generally, is on the increase. Estate and house agents inform us that many people who at one time would go far afield for their week-end recreation, are now taking smaller houses within radius of, say, 30 to 40 miles from town, making these a rendezvous for their week-end parties. In almost every instance where there is any real demand for this class of property, the presence of a stable easily convertible into a motor-house is regarded as essential. Here, again, the motor will revive the prosperity of many a pleasant village which promised to pass away altogether. We refer to these considerations because there has been a tendency to regard the motor-car as wholly destructive of some of the districts connected with ordinary country life; but, as a matter of fact, no destruction is going on. It is only the shifting of progress from one point to another, and, in the end, the people generally would be the gainers.

The Dog Census.

ACCORDING to the Board of Agriculture there are 1,871,619 dogs in the country, or about one canine to every score of human beings. These figures relate to those officially known; the numbers that have escaped the vigilance of the law, or whose owners prefer that they should not be enumerated, would swell the number into even greater proportions. It is, however, sufficiently annoying to motorists to realise that here are nearly two million chances of danger, and that in every dog may lurk one of the factors that lead to fatality. The education of dogs must go on more rapidly than it has done, or there will be many dreadful harrowing wails along the countryside, and many a collar without a dog to adorn. The responsibility must rest with dog-owners to keep their animals within proper bounds.

A Hint to Beginners.

IF those who are taking up motoring for the first time this summer will bear in mind that it takes a certain amount of experience to train the mind to act quickly enough in an emergency, much trouble will be avoided. A beginner may know exactly what to do and how to do it, and if he had time would be able to manage his machine admirably, but when a sudden emergency arises and the car is travelling rapidly, the driver must act in the fraction of a second if an accident is to be avoided. With experience one will be able to do so, and either steer through a tight place or stop the vehicle in a few yards; but it is only with experience that this facility comes, and consequently beginners should drive very slowly and cautiously at first if they wish to avoid the risk of a disaster.

Discretion Wanted.

AFTER a period of quiet behaviour that promised to lull motorists into the suspicion that the police had resumed their ordinary avocations, the campaign against speedy road travellers seems to have been revived. We must deplore the action of the minority of motorists who rush headlong through villages and hamlets playing "ducks and drakes" with all the poultry that may be about; but we must remind the police that the magistrates in many places have publicly declared against the present speed limit, and that in some counties the local authorities have no favour for zeal and officiousness on the part of constables in this matter. There must be a large discretionary power given to both controllers and users of the road. On a wide, clear stretch, with nothing but the winds to disturb the surface of the road, drivers frequently respond to a natural desire to put the best effort forward. Such a course in such circumstances involves no risks and raises no hazards. Why should the man who attempts it be caught by telephone or victimised by stop-watches? We doubt if even the renowned Sergeant Jarrett could give a satisfactory answer.

Questions in Scotland.

THE annual meeting of the Association of County Councils in Scotland was held at Edinburgh, with Mr. George Younger, the president, occupying the chair. Mr. Andrew Hutcheson raised the question of the speed limit for motor-cars, and asked the Association to give its imprimatur to the finding of the Scottish agricultural bodies that there ought to be a speed limit. The agricultural community, he contended, had first claim on the county roads, and he moved that the association petition in favour of a twelve miles' limit. Mr. Graham Hutcheson contended that the speed of motor-cars when proceeding through villages should be restricted. The chairman reminded the association that the matter was at present in the hands of the Scottish Secretary, and the Association's position was made clear by the recent memorial to the Secretary for Scotland on the subject. The matter was then allowed to drop.

Off Side.

MR. C. D. ROSE, M.P., was driving his motor-car recently, near Twyford, when in avoiding a cart coming up on the wrong side of the road, he was overturned. The car was smashed but Mr. Rose escaped with nothing worse than a severe shaking. That and the damage to the car were bad enough, especially as the mischief was done through no fault of the sufferer. The way in which the drivers of ordinary vehicles continue to keep on the wrong side of the road is not only perplexing but dangerous. A few summonses issued in connection with such waywardness in one or two country districts would teach a salutary lesson.

Fines of £500.

MR. J. L. WHARTON is M.P. for the Ripon division of Yorkshire, and has been enlightening his constituents with regard to his views on automobiles. His friend Mr. Walter Long, he said, proposed to introduce a bill for the regulation of motor-cars. Mr. Wharton thought it was obvious that some restriction on the vagaries of these machines was necessary. "We all of us have the right," he said, "to use these roads. There are some people who are disposed to use these new machines in such a way as to make them disliked by the general body of the British public." His opinion was that the best way of dealing with the problem would be in the first place to restrict the horse-power; that was to say, to put the limit at ten horse-power, if it was found this was an ample power for providing a safe and comfortable motor-car, but which would not enable it to travel at the enormous rate of speed which he and some of his hearers were terribly conscious some cars were driven. He lived on the Great North Road at Bramham, and sometimes drove to his birth-place at Aberford, and he had often seen motor-cars descending into the villages when children were about at a speed that made his blood boil with apprehension. Then, too, repeated offenders ought to be subjected to accumulative penalties. "If a man is fined £5 the first time," said Mr. Wharton, "let it be £50 if he comes up the next week, and if in the third week he again offended I would fine him £500. That is the best way to stop it; you want to inflict upon these men something they will feel. Why, to fine some of them a £10 note would be very much like fining me a fourpenny bit." Motorists need not look for much consideration from this M.P.

THE Felixstowe Advancement Association has issued a new guide to the town and district by Mr. Lemmon Lingwood. This will be appreciated by motorists, for it recognises those who journey by road as well as those who linger on the beach. A few years ago the roads in the locality were bad; they have lately been improved and a good standard of maintenance has been attained. From London, Felixstowe is distant about 81 miles, the route being through Stratford, Brentwood, Chelmsford, Colchester and Ipswich, and it is quite as interesting as any other of the holiday resorts on the east coast below Grimsby.

The Gordon Bennett Cup Race.

GREAT BRITAIN.

FRANCE.

AMERICA.

GERMANY.

DOINGS IN DUBLIN.

THE present year is likely to be memorable in the annals of Ireland. Politically there would appear to be a truce to the violent feeling that has characterised the country in the past; socially, the visit of the King will be one of conciliation to the populace and of profit to the traders; while industrially the advent of the automobile promises to develop a new trade, while assisting to revive the fallen fortunes of the country districts. And how they have fallen is well indicated at Rathcoole, a place through which hundreds of motor-cars have sped during June to provide the aged inhabitants with reflections as to the glories of the old coaching days when the roadside inns were prosperous.

All Ireland is interested in the International motor-car race. It is the topic of the man in the street, who sees in every begoggled driver of a motor-car some possible hero of Thursday's great event. Portraits of the competitors appear in the shop windows, and, for the moment, are more freely in demand than those of even the most popular actresses. Even the hosiers and clothiers have taken advantage of the occasion, and brought out new ties in green, red, white, and blue poplins, so that the partisans of the teams may sport their favourite colours, and already the street gamins are donning bits of green—a dual tribute to their devotion to the English representatives and to the national colour.

In the theatres references to motor-cars are cheered to the echo; the characters appear in motor-caps, heedless of their appropriateness to the particular play, and even the jarveys eagerly scan the "speeshul edition" to note the latest arrangements as to reaching the course. The Horse Fair, the Punchestown Races, the great review in Phoenix Park, the oratory of some national Parliamentarian, all touch Ireland's feelings to the deep; but this motor race has stirred the country as no event of recent times, and there is no doubt as to the genuine delight with which the contest is being regarded.

Motorists on foot are regarded with keen curiosity by other pedestrians, and the Shelbourne Hotel, the headquarters of the A.C.G.B.I., has brought hundreds of people into St. Stephen's Green to see the setting out of distinguished motorists. They, on their part, have reciprocated the interest shown locally, and have patronised the jaunting cars with a delightful freedom from prejudice which we could wish all owners of horses would assume to the automobile. And in some cases their confidence has been curiously misplaced. A couple of motorists the other day seated themselves back to back on an outside car, and had scarcely gone two hundred yards into Grafton Street when a rival car coming in the other direction bashed into the vehicle, robbing it of its footboard, and leaving the rider on that side with his feet dangling towards the roadway. A crowd gathered as quickly as would have been the case in London, and the motorist was able to draw a favourable comparison with regard to the automobile. Such an incident would have been impossible with a motor-car, and he says he will never be driven by a Dublin jarvey again.

At all the leading hotels petrol talk has been the order of the day—or rather the conversation of the evening. At one place an owner was in difficulty because his car had disappeared and also the small lad he had left in charge. It re-appeared a few hours later, the enterprising youth having had a spin round Donnybrook on his own account. The advantage of the automobile to the poultry rearers of the country was much discussed, and the prowess of, at least, two of the drivers in the big race has been heralded as pioneers in that direction. One owner of a car ran over a hen, whereupon an old lady greeted him: "Shure an yer honour ye've run over me hen—a good honest hen—a whole family of chickens."

"And what is the damage?" queried the motorist.

"I do not want to be rude, but shure, sorr, the hen is dead."

"Yes, but what shall I pay you for compensation?" The word compensation was sufficiently familiar to the good old soul, who thereupon declared she would "lave it to yer honour."

He threw half-a-crown to the old woman, who reminded him of the chickens, wanted double that amount, and finally compromised the matter on receiving 4s.

A day or two after the motorist was on the same road, and saw the same fowl limping along but still living. He stopped and asked the lad who was with the woman on his previous adventure how were his mother's chickens.

"Ah, shure," said he, "an' it's me mother that has no fowls; they belong to Mrs. Murphy." And Mrs. Murphy; it was discovered, lived on the opposite side of the road.

Such stories as to the ingenuity of some of the people have been current, and have passed many a pleasant hour. But occasionally sterner rumours have been floating from hotel to hotel, and on Friday the news spread as to the probability of one of the selected British champions not driving. Stocks was generally known to have a severe cold; Jarrott, however, was fit and well, and so far as the third, or rather the first, man was concerned, the appearance of Edge as he drove into Messrs. Hutton's garage on Saturday morning was quite dispellant of any such report so far as he was concerned. Estimates of the probable speeds to be attained in the race, varying from forty to sixty miles an hour, have formed quite an interesting study in motor circles, but as the race will have been run ere these lines will appear in print, we refrain.

The shop-windows have been transmogrified to a great extent, and the tailors that were formerly concerned with summer raiment now present almost an Arctic austerity with their displays of furs, leather clothing, and other costumes to combat keen and dampening weather. Names like Dunhill, Lovegrove, Allweathers, etc., familiarise the local shops to motorists, and nearly all the leading London motorists' tailors have appointed active agents in Dublin, who are making bold displays. The little knots of people that continually peer into the shop windows are a good reflex of the interest taken by the populace in the event. Opticians show goggles, fancy shops toy motor-cars, and a jeweller's near the Metropole Hotel draws the public by an exhibition of Gordon

Bennett race chronographs made by Messrs. S. Smith and Son. Altogether the shop-keepers have risen to the occasion, and even along the quay those who ordinarily deal with seafaring men have found land yachtsmen equally good patrons for sou'-westers and the like. In fact, the uncertainty of the weather has been a boon to all classes of traders, motorists having to be ready prepared for any emergency.

As we write the City is being stirred by a police notice posted on the garage of the Irish Automobile Club on Monday night, and since then advertised and circulated throughout the whole place. It is signed by Lt.-Colonel John Ross, the Chief Commissioner of Police, and warns drivers of "motor and other vehicles" against infringing the police regulations inside the area of his jurisdiction. Whether this is really warranted so far as motorists are concerned is a moot point, but the presence of so many fast cars in the City has naturally led the authorities to feel their position, and they are taking every precaution to prevent accidents. It speaks volumes for the skill and consideration of motor-car drivers that no unpleasant incidents in which

Mr. Ballin Hinde, and other well-known English motorists. The Irish Club is to be congratulated on its enterprise in thus assisting its British guests, for the provision of suitable accommodation for cars is one of the problems of the tour. Livery stables are being extensively utilised, and the charges have not been allowed to err on the score of modesty.

At the Dolphin Hotel, Dublin, the competitors in the race were entertained at luncheon on Saturday by the Corinthian Club, Sir Charles Cameron, C.B., being in the chair, Messrs. Edge, Jarrott, Mooers, and Owen representing the racers. The French and German teams were unable to be present, the latter having only just arrived, and two of the former being still on the water. An original poem of welcome to the visitors was read by Mr. W. A. Craig, in which they were apostrophised as the "Chariot Racers of the Motor Age." The speeches were brief and bright. Mr. Edge took a serious view of the matter, insisting upon the commercial and industrial aspect. Mr. C. Jarrott declared his interest in the sporting side of the event; Mr. Percy Owen expressed the pleasure it would give the Americans to

Photo by

Unloading the French Cars from the s.s. "Ferdinand de Lesseps" at Dublin.

[Lafayette, Dublin.

they are prominent have yet occurred, to mar the pleasure of the visit.

Hutton's garage, where accommodation has been provided for two hundred cars, has been a busy centre, and the language used has been equally as varied as the cars there staged. Special lock-up compartments have been reserved for Napiers, Mercedes, Daimlers, etc., while the other types have been placed in various parts of the garage the area of which covers nearly two acres. In the yard cars have been washed and repairs made with an energy inspired by the versatile Dr. Colohan, whose busy ways have proved infectious. The garage has been free and full; while the repairs made and the petrol supplied must have yielded a satisfactory turnover. Away at the other end of the City is the Earlsfoot Skating Rink, where eighty cars have been housed, and a large spacious yard provided for the shower-baths that have been necessary for the good appearance of the cars. Rooms for mechanics and owners have been provided, and among the gentlemen who have had their cars housed at this garage have been the Duke of Manchester, Mr. C. Gray Dinsmore (the representative of the United States on the International Commission), Professor Hele Shaw, Mr. J. Hargraves, Mr. G. Higginbotham,

return with the cup, and, in anticipation, promised all European motorists a hearty welcome to the States next year, a sentiment re-echoed by Mr. Mooers, who promised to do his best to win. Mr. J. W. Orde, as secretary of the A.C.G.B.I., took a wisely impartial view.

[BY TELEGRAPH.]

Wednesday.

On Monday fifty-six cars were landed at North Wall, Dublin, by the London and North-Western Railway Company, and another forty came by the morning boat on Tuesday. Last week sixty others were shipped, and it was anticipated by the officials that at least 200 would be received on Wednesday morning. These shipments are by one company. Only three hours and a quarter will be lost by the racers in the controls, and it is calculated that the race will occupy till between five and six o'clock. A Gordon Bennett Sweepstake, limited to 100 members, with one sovereign each, has been a topic of conversation in Dublin. There is one lady road steward, Miss Rowley, of Kells. Rigolly will drive a 100-h.p. Gobron-Brillie car at Phoenix Park on Saturday.

SHERBOURN HOTEL, DUBLIN, Monday.

LEAVING London in the early hours of the morning, we were enabled to escape the traffic and make a comfortable run to Stonebridge, just over a hundred miles, where a short stoppage was made. At the hotel we heard the landlord had been "rung up" at 4.30 by a party of forty-four motorists who desired and were served with breakfast. Continuing through uninteresting and poor country, the pangs of hunger reminded us breakfast had not been partaken of, so at the first likely-looking inn a halt was made.

to the travellers. As might be expected, a satisfactory meal was enjoyed, and much time was afterwards spent rambling over the queer old place, with its roughly-hewn beams almost touching one's head. Many famous travellers in the old coaching days stayed here, and amongst them Dean Swift, who must apparently have fallen foul of the hostess, for he scratched on a window pane these lines, "Thou fool to hang four crosses at thy door. Why not hang up thy wife; she's crosser than all four?" Lovely roads landed us in Shrewsbury, where a short but interesting time

THE FRENCH TEAM.

The inn proved to be the Four Crosses, a most charming place, with the date carved in its old black and white front, that also bore a Latin inscription, which translated read, "If we but knew our end in death, what bitter tears would flow; a day may stop our fleeting breath, yet laughing on we go." The entrance is a most quaint one, and the spotless appearance of the floor and tables in the cosy corner, the hanging green hams, and the sight of the kitchen—as large as a good-sized barn—were most welcome

was spent in what we should imagine to be one of the quaintest and most charming of cities in Great Britain. The views of the Severn—by the side of which we had driven for miles—were of the loveliest. An all too short but magnificent road took us to Llangollen, where a halt was made for luncheon. The whole ground being new to the writer, much time was taken in sight-seeing, and it was getting late when a further start was made. At Bettws-y-Coed, where the rain commenced, another halt was

made, the scenery passed being too well known for description. Through Ogwen, by the lake, and past the famous quarries of Bethesda, to Bangor it rained all the way, but that fact could not rob the scenery of its grandeur, the Dee of its bubbling beauty, or the roads of their excellence. A halt was here made for the night,

has to be crossed, and there are several lovely views, while Snowden keeps company with the tourist for some distance. The car went by cargo boat and reached North Wall by eleven, the writer travelling by one of the first-class North-Western boats. The rain commenced before boarding the vessel and continued

Salleron, one of the Reserve French Team, on his Mors car, on arrival at Dublin.

[Lawrence, Dublin.]

and the Castle Hotel is recommended. We made a mistake and did not stay there. At Bangor the scenery is superb, and, in combination with the Straits, the fleeting hours swiftly passed. To Holyhead needs no description, except that the Menai Bridge

without intermission till some time Sunday morning, having started Wednesday afternoon. This was unfortunate, for we poor Londoners had already suffered enough from the visitations of Jupiter Pluvius.

First impressions of a city under such circumstances could not be of the best, and when next morning it was found to be still raining, an enquiry of the hall porter brought forth the remark that just about this time the weather usually broke up, and that rain might be expected for the next six weeks! Considering that for half this time rooms have been booked, the prospect did not appeal to us. However, we were there to go over the course, and this, to a certain extent, we did. As far as Kilcullen, the roads were exceedingly greasy and travelling uncomfortable, but when the course was reached, the roads had been washed of all superfluous top. By Ballyshannon the steam rollers were at work, the roads were being filled with stones as big as granite sets, the carpenters were engaged strengthening the grand stand, while the car was travelling carefully with a view to avoiding the ugly corners. The course is not an ideal one, and we trust the race will not be marred by any accidents. Other days were spent in travelling to the various outside places. Wicklow was thoroughly explored. The writer has no hesitation in stating the scenery is magnificent, the roads not at all bad, and the apparent prosperity of many of the districts would compare favourably with any portion of England. The "jarveys," with their outside cars and their sprinting little ponies, were a never-ending source of delight, and the number of them, and the frequency with which they

but at present we would hazard a guess that the roads in the three counties covered by the course have more motor-cars on them than any other acreage in the world.

ARRIVAL OF THE RACERS.

The English team, whose names "are familiar on our tongues as household words," have long been acquainted with the curves and corners of the course. From Castle Rheban, near Athy, they have daily tripped to Ballyshannon, and other points of interest, studying the corners to a nicety, and reducing the art of driving to an exact science. Probably Mr. S. F. Edge could tell his rivals the exact angle at which to take all the corners, but he is of a somewhat retiring nature when questions of racing interest are concerned, and somewhat given to undue modesty of statement when questioned as to his knowledge. Even of his own car, "a neat little thing of say 40-h.p.," he nonchalantly declared to us when entering Hutton's garage with a new racer of reputed 110-h.p., last Saturday.

The American champions, or at least two of them, are almost equally well acquainted with the route, and their attitude of easy freedom with the natives has won the hearts of many who were naturally predisposed to favour the States. For there is scarcely a family in counties Kildare, Carlow, and Queen's which has not some of its members in America.

Messrs. Winton and Owen on Winton Touring Cars at Athy.

[Lawrence, Dublin.

were used, notwithstanding the fine electric trams, was astonishing, no doubt owing to the fact of the fares being sixpence to anywhere inside the City. The shops have been disappointing, but to catch the passing breeze nearly every shop front has motor effects displayed. Sackville Street did not strike us as anything special, while Phoenix Park and St. Stephen's Green were all that the imagination could desire.

The hotel lounge surely must be the most restless place in the world, and motorists ditto. The latter never sit still a moment; there is a sound of a horn and up jumps everyone. There are three Napiers at the door; there are two 60-h.p. Mercedes, there are a dozen other cars making the deadliest noises, Mr. Foxhall Keene rushing in and out like a dog at a fair; other men are just the same; off on their cars, absent for a minute and then back again, and so on.

At night the lounge, after dinner, is more restful. There are sitting Mr. Wallace, in company with Chevalier De Knyff, Baron de Vogne, Count Graf von Sierstorff, a Spanish count, etc., at one table; at other tables cosmopolitan groups from all parts of the world. The whole scene is different from the morning. During to-day there has been more peace. The Frenchmen on their racing cars, making folks think there was a battle raging and artillery firing going on, being the first away, and thereafter by the dozen cars left for the course. What this latter will be like by Wednesday night we do not know,

But greatest curiosity has prevailed with the French and German competitors who, although laggards in getting on to the course, are not likely to loiter on the day of the race. The German cars came along on Saturday, and a strange sight they presented as they drew up Summerhill after leaving the docks on Saturday morning. Mr. Foxhall Keene drove one, and with Baron de Cater's car they were a most remarkable procession. The cars were loaded with mechanics and men from the Cannstatt works, about as unkempt and unwashed a collection of men as could be imagined. One man, sitting on the rear of one of the cars, had cuts about his face and blood stains had clotted about his moustache, as though he had been fighting wild beasts, instead of merely rushing by policemen from Southampton to Holyhead in a way that must have caused some P.C.'s to think of the thundering and lightning of the infernal regions. The cars had been driven by road from Cannstatt to Havre, and one had toppled over, throwing its occupants into various neighbouring ditches and other receptacles for fallen motorists. But they had righted the car and speeded along, more anxious to get to Dublin than to have regard for personal appearance.

As we left the garage Jenatzky drew along, his fair face indicating a sanguine disposition, that feared nothing from the late hour he was going over the course. Once inside the garage, the three cars were quickly stabled and placed under lock and key. The men had brought their beds; these were quickly erected

by the sides of the cars, and each night the vehicles have been quiescent in the garage, their mechanics have proved as faithful guards as the sheep dog to his Highland shepherd. To those familiar with the scene that usually takes place in English competitions, the anxiety of the team to prevent any mishaps was striking—and wise, perhaps.

The French came last, or at least the cars, for M. Gabriel landed almost simultaneously with ourselves last week, and went direct to the Grosvenor Hotel, where he rested awhile before going to Fontstown, where he made his headquarters at the house of Mr. Biggs. He was met by many representative Irish motorists, and his prowess in the Paris-Madrid race has made him a popular hero in Ireland, where his fame had preceded him. The man knows no fear. The corners which have alarmed some amateur writers and caused even experienced drivers to shudder, made Gabriel smile, and after a complete

Lesseps" was taken in tow by the "Flying Witch." Shortly after noon she entered the Alexandra Basin, and was met by Captain Graves, the harbour master of Dublin, who superintended the berthing of the vessel. A great crowd quickly assembled, whose cheers were both hearty and spontaneous. Some comment was made at the non-appearance of many English motorists, but it must be urged in extenuation of the circumstance that considerable uncertainty prevailed as to the exact hour the vessel would arrive. Mr. Harvey Du Cros welcomed the visitors, who, as already mentioned, included Chevalier Rene de Knyff and M. Henri Farman, as well as M. N. Heath and Berteaux, who will act as auxiliary drivers should either of the former not be able to drive. Other well-known motorists coming by the same vessel were Comte Szapary, M. Holtzer (whose yacht, the "Tritonia," has been some days at the North Wall), Duc de Arlon, Baron de Crawhez, Baron Thenard, Messrs. Garier, Jun.,

SNAPSHOTS ON THE COURSE, TAKEN IN THE RAIN.

circuit of the course, he is reputed to have described it as easy as a railway track. He regards a couple of complete trips quite sufficient to become familiar with the awkward twists, and would probably set down the extra trips he has had as merely intended to "pass away the time." The best tribute to his nerve comes from the photographer, who tells us that Gabriel faced the camera for four minutes with never a tremour and with a hand as steady as a piece of mechanism. Never before has such a man faced the camera of the leading Dublin studio.

Chevalier Rene de Knyff and M. Henri Farman arrived on Sunday by the "Ferdinand de Lesseps," the boat bringing seventy first-class and 150 other passengers, its cargo consisting of thirty-one motor-cars, including three Panhard racers. It had been expected she would have been put into Kingstown Harbour, but at eleven o'clock a Dublin pilot went on board, and the "Ferdinand de

Durenne, Abel Deblanc, Faure Baulien, Leys, Prevost, Adrien Panhard, P. Panhard, Pasquier, A. Sarozin, Lemoine, Cosard Barie, Labourette, Michelin, Barbotte, Ménard-Dorian, Giffard, Hermann, and a dozen or more journalists.

A De Dion voiturette having been taken from the ship, the Panhard racers were next unloaded, and then the Mors cars were landed. At once M.M. Gabriel and Salleron took the latter in hand, while the Panhards were temporarily taken to a wharf shed before being got away to Hamilton's Hotel, at Athy, the Panhard headquarters on the course. On Monday, the five cars used by the employees of Panhard were driven from the docks to Athy, and their appearance attracted general attention in Dublin. Loaded with cans of petrol, carefully boxed and sealed, as well as with spare tyres and parts, and with "crews" of begoggled men all intent on getting to business,

They demonstrated to the public the pains that are being taken by the competitors to secure the victory. Later in the day, the lorry belonging to the Mors Company was despatched to Fontstown laden with petrol, the cases of which bore marks of earlier journeys in connection with the Paris-Madrid race. These firms leave nothing to chance, and, like the Germans, have left no precaution to secure everything being in perfect order on the great day.

FROM DUBLIN TO THE COURSE.

There are several ways of getting to the Course, but one has been chiefly used by the competitors in getting from Dublin. It has also proved the most popular with visiting motorists—not because of its scenic beauty or delightful surface, but for the simple and satisfactory reason that it is the most convenient. The Curragh may be reached *via* Athgarvan; Kilcullen by way of the Beggar's End; Castledermot by leaving Dublin then Terenure, and ascending the Pass of Mount Seskin, which rises about 1,000 feet; Kildare by

road is variously interesting, a stone wall on one side being faced by roughly-kept hedgerows, with tall trees obscuring the landscape and giving a delightful fringe to an otherwise dull road.

A score of chickens create some diversion. They mobilise in the centre of the highway, and affect indifference to the wheezy piping of the horn. Stentorian voices do not move the feathered bipeds, and not a wing do they flap till we are preparing to swerve around them, when, parting into two companies, they rush helter-skelter to the hedge, leaving the car to go on its way conscious of having shortened no fowl life. The poultry of these parts have become accustomed to motors, and seem to take a delight in irritation.

The clean whitewashed cottages are bright specks as we maintain our pace—no police in sight and no lives to endanger. Here and there a pink-washed cabin reveals the æsthetic tastes of its occupier, although our respect for his artistic nature is spoiled by the scene inside—a brief revelation of which is obtained through the open door.

And so on to Rathcoole, with only one grand residence, viz.,

Photo by]

The Gordon Bennett Course—Double Turn on the Road between Carlow and Magney.

[Lawrence, Dublin.

Lucan, Sallins, and Newbridge; and other points are between thirty and forty miles from Nelson's Pillar—the point at which all trams meet in Dublin. The most direct route, however, has yet to be mentioned, and is one to be avoided on the day of the race, as its convenience will naturally lead to its congestion on that occasion.

However, there was no race last Friday, and so we then set forth to view the Course, proceeding by way of Naas and Kilcullen to Ballyshannon cross roads.

The morning opens sullenly, but the trusty Mercedes was as fit as ever, and, nothing daunted by the low'ring skies, we move away to the south-west by way of Kilmainham, passing the gaol on the right and leaving the Wellington obelisk far away in the Phoenix Park. From the windows of the prison there must be a fine view of the hills on the other side of Dublin, but the place itself has a sombre hue. On the left the barracks are conspicuous, a Highlander doing "sentry go" as we skurry along to Inchicore, where locomotives—not of the light variety, however—are the main product. Passing Clondalkin there is a steady rise to Rathcoole, which is about 500 feet above the sea level. The

Castle Bagot, to break the monotony of the occasional rows of cottages and the continual rows of hedges and walls, with luxuriant fields beyond. What pasture land, were only the cattle there! What cultivable areas, if only things were righted in Ireland and the harmony of the people were secured!

So far our journey has been made amid the frowning of the skies above, but now the clouds become diaphanous, and their fleecy whiteness promises something better. In Rathcoole we see the sun—and also the winter of the people's discontent. Was there ever such a place? Every other house is a ruin, and if ever a town appeared fit for bankruptcy we have come upon that town. Standing conspicuous in the surrounding landscape, the pride of the place appears humbled, and although none of the hamlets between Dublin and Kilcullen have an air of respectability, none have fallen so low as this town, so prettily nestling at the foot of great Saggart Hill, which rears its head thirteen hundred feet, and has its foot above a scene of poverty and squalor. Thackeray saw the place, and it had disappeared from his memory in three days; it will ever linger in our minds as almost the bottom rock of desolation and despair. And such is

the way to the Gordon Bennett Course. Foreign visitors should go to Glendalough and Ashford, in co. Wicklow, for the antidote to such a scene.

Beyond Rathcoole, and all the way to Kill, the animals seem to be straying as though it is their holiday time. A couple of donkeys look knowingly from the grass-covered footpath, and a flock of geese cackle along for fifty yards until they give up the unequal contest, and retire with honour and with life. A crow, less fortunate, lies in mourning to the rear as we shoot along to Johnstown, one of the prettiest hamlets on the route. Away to the left are the hills covered with clouds that mean to do us no good. Hardly have we passed the village than the rain begins to strike obliquely, and the pleasant smiling scene of a few minutes before is like "Niobe, all tears"—but the tears are streams, and the streams quickly gather into rivers. Parapluies, sou'-westers, and good spirits become absolutely necessary. The peasants must regard us as seafaring men floating in an unaccustomed element.

After a while the rain slackens; but not the Mercedes. She runs along, nothing daunted by the flood, and shortly before reaching Naas the rain ceases to flow in such torrential fashion. At Naas is seen the first building in course of construction all the way along—quite a novelty. On the roadside a road-mender is preparing to resume his breaking of stones, and, wearing a pair of goggles as he does, the man looks like some victimised motorist doing hard labour for speedy travel—an anticipation of what some J.P.'s would like to inflict upon motorists who go their way involuntarily. At Naas we look for the hotel—and find it. The guide book proves itself no guide to the place; but the proprietor is obliging, and although wet without we are dry enough within. Opposite is the Courthouse—one of Ireland's most prosperous institutions, and a substantially-built building reveals the fact that Naas can run its own newspaper and loves to come into contact with the great world beyond.

Donning goggles and mounting again, we make a direct run to Kilcullen, a pleasant little place that "tumbles down one hill and struggles up another," the Liffey being at the base of both. The ancient bridge was the scene of a stirring encounter in the insurrection of '98, and even now the town—which is only an overgrown village—has ideas beyond its station. One innkeeper, who has "a choice corner site," has rechristened his house "Flanagan's Motor Bar," a quiet compliment that he evidently regards as likely to be profitable. Such efforts should not go unrequited. There are ruins of abbeys, and houses in ruins all about the place, while a combination of hotel, inn, grocery and drapery trades gives some of the features of a great London stores.

And at Kilcullen we are upon the Course. Men are already putting the telegraph poles into position, and the barbed wire to keep the public from the route is waiting to be fixed. For here the cars will turn, and after twenty yards another turn will again give them a twist. The owner of the corner house is delaying his spring-cleaning and painting till after the event—possibly in anticipation of compensation for disturbance should any of the drivers happen to make the slightest miscalculation at the corner.

The road from Dublin to Kilcullen is not wholly bad; there are good stretches, but there are also bad ones, and bumpy. Once on the Course a distinct improvement is observable, and we journey as far as Ballyshannon cross roads, where the start will take place. Under the grand stand erected by the Automobile Club is a great confusion of timber, stones, and steam rollers, and much work will have to be put in to bring it into proper order by the day of the race. However, the officials are in earnest, and the danger of leaving anything undone is realised.

Returning to Dublin by the same route, the same features presented themselves as on the way out. Only one motor-car was seen, while the indifference of the horses to the automobile showed what splendid educational work has been done of late. Even that must be of advantage to Ireland.

ON THE COURSE.

NEVER before have the Irish railway companies made such preparations for taking the sightseers from a distance as on the present occasion, and return fares at a fare and a quarter will appeal to those of frugal mind and tender pocket. Some of the companies will be running dining cars through the night, with ample provision for hungry souls. Hundreds of jarveys from various parts of the county of Dublin are leaving for convenient points, and hope to make small fortunes in driving spectators from the railway stations—most of which are situated a few miles from the Gordon Bennett route. At 2.30 a.m. the Dublin and Blessington Steam Tramway Company will commence running special trams with bicycle trucks attached from Terenure to Poulaphuca—about eight miles from Kilcullen—and it is expected that these facilities for reaching a convenient centre of the route will be taken full advantage of by cyclists, who will find a fairly good road by which to reach their objective on the day.

SEEING THE RACE.

FACILITIES for seeing the race are ample; the only difficulty will be to reach the various points of vantage. Between Kilcullen and the Moat of Ardsclull, where the cars will speed along seven times, several fields were still to let when we traversed the Course a few days ago. At other points of vantage stands were in a forward state, while the presence of a traction engine, with three or four trailing wagons laden with timber, told of the anxiety of contractors to have every seat ready in good time. Bower's stand has a good location on this road, and the Thomastown stand was another that seemed likely to have plenty of patrons, judging from its position. At Kilrush, Messrs. Meccredy, Percy and Co., have a stand with which Messrs. Thomas Cook and Son have also been associated, while they will entertain many friends at the Moat of Ardsclull—a splendid point from which to see the cars coming at full tilt along the straight, and then, with an awkward swerve round the Moat, they will dash along to the Club Enclosure, where the Grand Stand arches the road, and will form a landmark for the drivers on Thursday. Opposite the Kilrush stand is a "natural stand," which really means an open field, admission to which will be obtainable on payment of three shillings—the most moderately priced accommodation along the whole route. Near the rock of Dunamaise at Aughnahilla, Stradbally is a good position, with—to quote the advertisement—"an unbroken stretch of seven miles, plainly visible to the naked eye; with glasses the cars can be kept in view for thirteen miles of fastest stretches." To this is added the suggestion, "contradiction defied," thus challenging the announcement of rival stand proprietors. On the Curragh, the Turf Club have obtained permission for a stand, and the Great Southern and Western Railway are running special trains in the early morning to a siding at the back of the stand. Other notable stands are that fitted up by Messrs. Bodley and Duthie, a mile and a half from Athy; that of the Ballintogher Cycle Club, on a cutting at Youngstown, midway between Athy and Ballyshannon; on land at Fontstown, and at other points too numerous to mention.

THE WEIGHING-IN.

[BY TELEGRAPH.]

NAAS, WEDNESDAY.

TO-DAY the weighing-in is taking place here at Naas—an inconsequential little town, with one good main street and many little bye ones, all dirty and drab and unlovely. With less than 4,000 inhabitants, Naas boasts a barracks, a gaol, and a workhouse, and although the two latter appear too large for the place, they find excellent custom at times. In the old coaching days, Naas was of some importance, and its inns were inns. Now the hotels are general stores, and on the great main road the bar to one of the leading hotels is reached by way of the bacon store and dried fish emporium. Such was the experience of many who came here this morning, after the run from Dublin—to which we have said good bye for at least forty

hours, i.e., if all goes well. Naas is ancient—in fact, one of the very oldest Irish towns—but it has never seen such a sight as is presented by the weighing-in of the cars to-day. How different to the scene in the market-place as described by Thackeray in his "Irish Sketch Book," sixty-two years ago, when he found the town, as now, "poor, mean, and yet somehow cheerful." Three miles away is the Punchestown racecourse, and there weighing-in is not unknown; but not such weighing-in as we have come to do on this day of bustle and worry.

We have had a splendid run from Dublin. The weather has settled for fine, and clouds of dust have been aroused. Hundreds of jarveys were passed making their way to railway stations ready for to-night, when thousands are expected. Major Lloyd, Colonel Crompton, Mr. Lyons Sampson, the latter in charge of the weighing, awaited the racers. Jenatzy came early, then Edge, with Cecil Edge as mechanic, distinguished by their green caps. Gabriel followed, his car being towed to the weighing place. The scene in the old market place was animated, the people being kept from the railed space by the Royal Irish Constabulary. One after another the racers came along.

The weight limit is 19 cwt. 3 qrs. 7 lbs. Gabriel scaled 7 lbs. below limit. Owen's weight was 17 cwt. 21½ lbs. The reserve Mors car (Salleron) scaled 19 cwt. 3 qrs. 1 lb. Great interest was aroused in the weighing of the Napiers, and Edge's appearance was greeted with a hearty cheer as he came up on his new big racer, which he has, after all, decided to drive in the race to-morrow. Its weight was 19 cwt. 1 qr. 20 lbs. Jarrott scaled 19 cwt. 2 qrs. 20 lbs.; his mechanic will be Bianchi, while MacDonald will accompany Stocks. Some sensation was caused during the proceedings by a man falling from a balcony; he was, however, unhurt. Brilliant sunshine prevails, but the weighing progress is long and tedious. The constantly arriving cars, to some extent, relieve the monotony, and over a hundred automobiles are now here. Edge's reserve car, the 40-h.p., weighs 18 cwt. 3 qrs. 10 lbs.

Most of the members of the International Commission are present at Naas, and the assemblage is fully representative of European and American automobilism. The roads at dangerous corners of the course have been oiled.

A REHEARSAL ON THE COURSE.

[BY TELEGRAPH.]

KILDARE, Wednesday.

An exciting afternoon. We leave Naas before the weighing is finished and rush along to Kilcullen, down hill and up again, overhauling car after car. At Kilcullen the road is closed for rehearsal over Eastern Circuit. The Rev. Dr. Walsh, Archbishop of Dublin, decides to take a run round the course with Mr. Cordingley on his Mercedes, and with six passengers up we journey to Ballyshannon. What a change since Friday! The broken patches have been rolled, the stand is finished, and everything is in order. Major Lloyd is here to practise starting; the pilot is sent off, and we draw up as first starter. One minute, says the Major; then we get to forty seconds, thirty, twenty, ten, five, and at last the word "go" sends us off at a spanking pace. We rush to the first turn, and his Grace the Archbishop looks nervous. At every twenty yards there is a policeman, and in Old Kilcullen quite a crowd of women hold up their grandchildren to see the car, and men hold back their dogs. Excitement is intense—a foretaste of to-morrow. Into Ballitore and Moone we go, and then take a fine stretch to Castledermot. The Archbishop is delighted. Away on the horizon are the hills, with little church spires dotted on the landscape. Past the noble ruins we enter a cloud of dust—impenetrable, dangerous, and nasty to the tongue. The black coats of the Archbishop and his chaplain become whitened in a moment. Quickly we get into the cloud and find a car. Horns are blown, throats are choked, and we pass with a wild sweep. Carlow is an immense concourse, and as we rush round the corner a shout of welcome from the people greets us. Then comes the tricky road, curling and curving all the way to Carlow. Mageney Bridge is only one of many awkward turns, and was enough to try the

nerves of our crew, some of whom were having their first motor-car trip. Frightfully narrow is the road from Mageney to Athy, and should any passings be attempted there accidents must happen. The men, however, know the road, and may be expected not to tempt accident along the strip. Fortunately all the nasty turns have been oiled, and the dust laid, otherwise something of the clouds seen in Paris-Madrid might be expected to-morrow. Down we rush to the Moat of Ardsclull, and then, with a terrible swerve to the right, enter the straight for Ballyshannon. A car is coming the reverse way; we both shot to the grass, and with a mighty effort our Mercedes gets upon the road again; it was a narrow escape. Then to the Grand Stand—forty-seven miles in the hour—and thus ends the Archbishop's first run. Earl Roberts, Baron Henri de Rothschild, Earl Russell, and others greet us, and then another rush is decided on, the narrow road to Kilcullen is negotiated, and we take the double corner opposite Flanagan's Motor Bar in right royal style. In a few minutes we are on the Curragh, rattling along a mile every minute, and dashing into Kildare at a terrible rate. Within a minute we are at a standstill, and learn from Mr. R. E. Phillips that a new scheme has been adopted, by which the result will be known two hours earlier than was expected. Instead of half the ticket being sent back to the timekeeper at the end of the Control, it will be put in a pouch on the car. These will be collected at Kilcullen Corner as the cars go round each time, and sent back to the timekeepers at Ballyshannon. The rehearsal has been a great success. The weather continues hot, and all is in order for our midnight spin round the entire course to see that the clocks are in order, and then, at seven o'clock, will be the culmination of months of excitement and preparation. There is no doubt as to the tension of the people; it shows itself at every corner, and no one will work to-morrow. The road is now in splendid condition. Marshals and stewards—many camping by their positions—are already taking their places.

'SYNCHRONISING THE WATCHES.

[BY TELEGRAPH.]

BALLYSHANNON, 6.30. a.m., Thursday.

At a quarter past two we started with Mr. H. Smith to synchronise the watches at the various controls. The acetylene lights shine brightly in the darkness, and across the Curragh we speed at sixty miles an hour. Kildare is soon left behind, and then we go straight for Monesterevan. The day is breaking, and a ruddy glare streaks the ashen grey clouds in the east. Tents with relays of tyres are becoming numerous, and down the hills we rush at terrific speed. The oiled portions of the road are a menace, giving the appearance of objects on the otherwise sandy surface. Across the great heath of Maryborough we fly, and peering into the coming day manage to take one of the nastiest corners in safety. There is a bad turn towards a pond, and then a violent lurch to the right; we dash along, splashing the water, and swerving with the rolling motion of a ship at sea. Soon the gaunt rock of Dunamaise is passed. The narrow strip of light gradually increases, and soon we are again in the open; in Stradbally the people are awakening, and cheer as we dash by. Then the road narrows, until it is little more than eight feet across. Now the full orb of the sun comes in view, and we turn through Carlow, leave the ruins of Ballitore behind, and dash away to Kilcullen, arriving at Ballyshannon soon after five. The grand stand is half full by six, and great crowds are treading the damp grass to the Club enclosure. Gabriel is already astir, and rumours of other racers being about are rife. At half past six the wind is getting up strongly, and dark clouds are coming over the landscape. The starting-point is a veritable Babel of every tongue, and excitement is increasing.

Drafts of military have arrived from Dublin. In addition to 2,000 Constabulary, 2,000 mounted soldiers and infantry are stationed along the route. Patrols are strolling along the roads clearing them of stray cattle. The side roads have all been wired off.

THE RACE.

[BY TELEGRAPH.]

KILDARE, Wednesday Midnight.

At 6.30 a.m. to-morrow, the two pilot cars—one driven by Lieut. Mansfield Smith-Cumming and the other by Mr. Mark Mayhew, L.C.C.—will leave Ballyshannon cross-roads to warn the spectators of the imminence of the start. They make the entire circuit of the course, one going east and the other west. No one will be allowed afterwards to cross the course, save at controls, until it is officially announced that the race is concluded.

There will be an interval of seven minutes between each car starting. The start will take place on a slight down gradient, the cars going off in the following order :—

Time. a.m.	No.	Make of Car.	Driver.
7	1	Napier	Mr. Edge.
7.7	2	Panhard	Chevalier de Knyff.
7.14	3	Winton	Mr. Winton.
7.21	4	Mercedes	M. Jenatzy.
7.28	5	Napier	Mr. Jarrott.
7.35	6	Mors	M. Gabriel.
7.42	7	Peerless	Mr. Mooers.
7.49	8	Mercedes	Baron de Caters.
7.56	9	Napier	Mr. Stocks.
8.3	10	Panhard	M. Farman.
8.10	11	Winton	Mr. Owen.
8.17	12	Mercedes	Mr. F. Keene.

As mentioned last week, the colours for the cars are : Great Britain and Ireland, green ; France, blue ; the United States, red ; and Germany, white.

Baron de Zuylen will be the judge, Major F. Lindsay Lloyd the starter, and Mr. R. E. Phillips the timekeeper-in-chief. There will be seven controls, the head marshals being as follows :—Kilcullen, Mr. P. W. Northey ; Castledermot, Mr. E. de Wilton ; Carlow, Major Bower ; Athy (East), Mr. J. Macdonald ; Kildare, Major H. Welch-Thornton ; Monasterevan, Mr. T. W. Staplee Firth ; Stradbally, Mr. V. Silberberg ; Athy (West), Dr. Boverton Redwood.

In all, 161 officials will be engaged at the controls, and everything has been done to secure perfect order to-morrow.

BALLYSHANNON, Thursday Morning.

At half-past six the Star car, driven by Mr. Joe Lisle, and the Wolsley, driven by Lieut. Cumming, start as pilots. Half an hour later Mr. Edge arrives at the starting-point. Major Lloyd calls "Attention!" and he is off amid the plaudits of the crowd. He gets nicely away, and disappears in a cloud of dust. De Knyff shoots off at once straight and strong—a splendid start. Owen seems over-anxious, and is slow. Jenatzy is all excitement, and is rapidly giving instructions to his mechanic. Clutching the lever strongly, he gets away at once, and at the fastest speed of the first quartette. Jarrott comes along leisurely, smoking a cigarette, and faces the starter with apparent nonchalance, getting away in fine form. Mooers is nervous, and actually makes a start with his brakes on. Baron de Caters comes coolly along, shakes hands with Mr. C. Gray Dinsmore, and makes a start second in excellence to that of Jenatzy. Stocks bids farewell to Napier, and is soon picking up speed. Then comes Farman, who is warmly greeted by the French visitors, and he gets away, losing, however, 17 secs. Winton is unfortunate, being unable to start owing to carburettor troubles. His car draws to roadside, the stewards form a cordon round it, and Winton sets to work. After 7 mins. interval Foxhall Keene comes in view. The proceedings become somewhat monotonous, and already interest is flagging. Keene's motor stops and he loses a few seconds. Winton is still by the roadside, and will be handicapped accordingly. The marshals are now clearing the course, and there is a general stampede to provender baskets. Edge passed Ballyshannon at 8.24, 5 mins. before he was expected.

ATHY, 9.30 A.M.

Mooers lost a pin of his speed gear at the Athy control, and is out of the race.

CARLOW, 10 A.M.

Mr. Stocks is uninjured. He ran off the road into a wire fence two and a half miles outside here. It is not yet known whether his car is sufficiently intact to continue in the race.

BALLYSHANNON, 10.30 A.M.

The following are the official times of the leaders in the first loop of the first round :—

Edge, 1 hr. 23 mins. 2 secs. ; De Knyff, 1 hr. 33 mins. 47 2-5 secs. ; Owen, 1 hr. 47 mins. 57 2-5 secs. ; Jenatzy, 1 hr. 47 mins. 58 2-5 secs. ; Jarrott, 1 hr. 53 mins. 10 4-5 secs. ; Gabriel, 2 hrs. 5 mins. 10 4-5 secs.

Edge completed the second loop, making the first round at 10 o'clock. Mooers, Stocks, and Winton have yet to complete the first loop.

BALLYSHANNON, 11.26 A.M.

Jarrott injured in accident at Stradbally, doctors sent for. He is out of the race. Jenatzy, De Knyff, Farman, Gabriel, and Edge are leading. Americans going badly. The cars are jumping over the roads, and the drivers are finding difficulty in negotiating the route between Carlow and Athy.

BALLYSHANNON, 12.30 A.M.

Stocks' wheel smashed. Jarrott's car struck side of ditch and his mechanic is hurt. De Knyff has passed Edge. England's chances are regarded as hopeless. Keene is passing, followed at an interval of one minute by Jenatzy. Everyone is anxious as to the whereabouts of Edge. Stocks dashed into a fence at Castledermot.

BALLYSHANNON, 1.22 P.M.

Edge, Gabriel, and De Caters have passed, Edge and Jenatzy having done a flying mile at the rate of sixty-four miles an hour ; De Knyff has done it at sixty-six miles per hour. The Americans have not been seen for some time. Farman is whizzing by. A notable feature is De Knyff's short circuit in one hour eighteen minutes fifty-seven seconds. Rain threatens.

AFTER THE RACE.

At the Skating Rink at Earlsfoot Terrace an exhibition of the racing cars, together with representative types of touring cars, will be held on Friday and Saturday of this week, and a charge of two shillings will be made for admission. Despite the counter attractions of the Gymkhana and speed trials in Phoenix Park, this will doubtless be greatly patronised, and a display of the products of Irish cottage industries will be made, so that the pockets of visiting motorists may be lightened appreciably. The building is well adapted for the purpose, and, although not large, will enable the Irish people to realise even more thoroughly than they can see in the streets the leading features of the jaunting car's new rival.

The speed trials in Phoenix Park are, naturally, attracting attention, and they will give the people of Dublin an idea of racing such as is not possible in connection with the Gordon Bennett race. All the events will be run over a course of one mile and one kilometre, 2,853.6 yards, in heats of two cars or six motor-cycles.

On Monday the tour will commence to Newcastle, co. Down, and Belfast, and on Tuesday next there will be a hill-climbing competition on the famous Ballybannon Hill, at Castlewella, and a race from Clough into Castlewella, commencing at 10 a.m. The hill to be climbed is about one mile in length on each side, with a rise of 300 feet. The test will start from Murland's factory, at the foot or middle of the two hills, and the cars make the best speed they can up past Ardnabannon House towards Clough. At a mark on the top of the hill the times will be taken, and the cars then pass on at their leisure to Clough, where they will be marshalled for the race back in the afternoon. The best view will be obtained from the Automobile Club enclosure at Ballybannon Hill, which has a frontage of nearly 300 yards on the hill road. Here the band of the Faugh-a-Ballaghs will play during the day. A small village of luncheon and other tents is being provided by Messrs. S. Wilson and Company. There will be a footbridge across the road, so that visitors to the en-

closure can get in at any time after the road is closed. The road from Clough to Castlewellan will be absolutely closed to all traffic from 10 a.m. till the races are finished.

On the following day the motorists will return to Dublin, and then on the 9th will start for Cork *via* Waterford or Lismore, at one of which places the night will be spent. On the Friday there will be an eliminating race for motor-boats at Queenstown, and in the afternoon a speed trial for motor-cars on the Carrigrohane road, Cork.

On the 11th, the motor-boat race for the Harmsworth Cup will take place, and then on the 12th the tour to Killarney and the south-west will commence.

THE IRISH FORTNIGHT.

GLENDALOUGH will be visited by many motorists during the Irish fortnight, and the Rev. M. Hogan's brief guide to its records, ruins, and romance comes at an opportune moment. This is published by Messrs. Browne and Nolan, Limited, and the modesty of the author is conspicuously shown in his advice to the reader to save time when at Glendalough by not depending wholly upon his interesting pamphlet, but by ferreting out a local guide, Patrick Barrett being the most notable, his patronage having included Royalty. But even with the local guide, the Rev. M. Hogan's book will be useful, if not indispensable, to the visitor wishing to check the story told by the local enthusiast.

DURING the Irish Fortnight owners of M.M.C. cars in Ireland will be able to get spare parts for their vehicles from the Irish Motor Company, of 55, South King Street, Dublin.

SINCE his arrival in Ireland, Mr. L. P. Mooers has been practising on the Gordon Bennett course with a 10-h.p. M.M.C. car.

BARBAROUX, the victor of the kilometre race and hill-climbing trial at Huy, Belgium, the other week, is bringing his 60-h.p. Benz Parsifal racing car to Ireland to compete in the Phoenix Park speed trials.

NEAR the O'Connell Bridge in Lower Sackville Street, Messrs. Merced, Percy, and Co. have opened an inquiry office, where help to strangers visiting the island will be gladly given.

ONE of the largest enterprises in connection with the Gordon Bennett race is the stand at Kibrush which is the property of Messrs. Merced, Percy, and Co. and Mr. George Langley. This stand is situated half a mile from the start and commands a view of the finishing straight. From this coign of vantage the spectator will observe all the incidents which precede the start of the great event, as well as the fluctuations of the race itself, to advantage.

MR. W. F. PEARE, of Waterford, writes:—"I notice that my name has not been included for Waterford in the list published by the Anglo-American Oil Company of 'Where to obtain Pratt's Spirit,' although I have the largest workshops and garage in Ireland, and sell a ton of spirit for every gallon sold by any other retailer in this part of Ireland, and have always in stock several tons of Pratt's spirit. I shall feel much obliged if you will kindly give publicity to this fact in your columns for the convenience of tourists in this part of Ireland, where my garage is open day and night."

ON Sunday about eighty-five cars arrived at North Wall, and on Monday seventy more came from Holyhead, the arrivals including the Star car direct from its adventures in the Circuit des Ardennes, its light hue of green making it a conspicuous object among the score or so of vehicles with which it was, at first, put down in the garage of the Docks and Harbour Board. The loading and unloading arrangements devised for the occasion worked splendidly, and will be thoroughly clear to the reader

from one of the photographs in the present issue. Only one mishap took place, a chain breaking just as the car on the cradle was within a foot of the ground. Fortunately the only damage done was the breaking of some of the spokes in the steering wheel.

THE day of the race was practically a general holiday. The Dublin Stock Exchange was closed, many of the markets were not open, and in and about Dublin universal festivity prevailed.

ON Monday De Knyff and Baron de Caters took a spin along the Course in company, and M. Jenatzy was schooling himself at some of the trickier corners. During the day forty French cars were seen at Athy, as well as a dozen German and a great number of British automobiles. The roads were somewhat dusty, and the villagers had some idea of what to expect in the way of dust should the present fine weather continue.

ALL who go to camp at the Moat of Ardsclull will find two candles provided in each tent, also a basin and soap, but campers will have to provide their own towels. Accommodation is provided for storage of motors, motor-cycles, and bicycles—the fees payable being 5s., 2s. 6d., and 1s. respectively. A smoking concert will be held on each evening in camp, and owing to the great labour and difficulty of providing a supply of spring water to the camp, gentlemen are requested to avoid waste of any water. "All lights to be out at 12 o'clock" is a bye-law to be strictly enforced.

AT the Royal Irish Constabulary Sports at Navan, on Monday, H. S. Huet won the five miles motor-bicycle race on a 2½-h.p. James machine.

THE Gordon Bennett course should be in splendid condition on the day of the race, and although there are some nasty corners, the surface should be well conditioned. At one time it was understood that none of the racing cars would be allowed upon the Course till July 2nd; but that regulation has been overlooked, and the racers have been practising for days on the identical cars they will drive. This has occasioned much comment, and it is suggested that rules should be made for observance.

VISITORS to the Emerald Isle must remember that eleven Irish miles are equivalent to fourteen English ones. The peasantry of the country generally calculate by the former, hence the necessity of the warning.

THERE is a pathetic interest in the fact that the suggestion with regard to the colours of the competitors was made by the late Count Zborowski, who was regarded as one of the probable British champions until his untimely death in the La Turbie hill-climbing competition at Nice removed a popular motorist and a thorough sportsman.

TO Connemara and West of Ireland will go many visitors desirous of extending the official tour. The Midland Great Western Railway of Ireland, whose headquarters are at the Broadstone Terminus, Dublin, are preparing an attractive programme of tours, including circular routes from the Irish capital to Connemara and Killarney. Achill Island will be a centre of interest to many, and the six days' itinerary suggested for seeing the sights of the place can be crowded into a third of the time by those who journey thither by motor-car.

SEVERAL tradespeople in the district of the Curragh Camp are stocking petrol, in view of the number of motorists likely to be in that district.

LATEST NEWS.

BALLYSHANNON, 2.40.

England and America hopeless; contest between De Knyff and Jenatzy. Foxhall Keene retires, thinking his axle is breaking.

CONTINENTAL NOTES.

BY "AUTOMAN."

THE illustration reproduced on page 335 shows the 60-h.p. Benz car driven by Barbaroux in the Paris-Madrid race. His time for the run to Bordeaux was 8 hours 36 minutes, a performance which secured him the 28th position in the heavy car class. This is the first time a Benz car has taken part in an international event. The vehicle has a four-cylinder engine (160 mm. cylinder dia. by 140 mm. stroke) and cardan shaft transmission. The inlet valves are mechanically operated. The frame is of stamped steel while the gear box is adapted to give three speeds ahead and reverse motion.

ON Friday night last week the steamer *Ferdinand de Lesseps*, belonging to the Compagnie Générale Transatlantique, and chartered by the French automobile manufacturers, Messrs. Panhard and Levassor and Messrs. Mors, left Havre for Dublin, having on board upwards of 150 Frenchmen, interested in the automobile industry, either as simple enthusiasts, manufacturers, competitors in the race, and their substitutes, or as members of the Press. It is well known that the French people do not travel nearly as readily as we English, and most especially a sea journey is considered as a tremendously grave undertaking. But this journey, in search of an almost unknown island, hidden behind Great Britain, and away somewhere in the North Atlantic, is,

The Circuit des Ardennes—Guders on Pipe Car Taking the Corner at Bastogne.

as may well be imagined, an event in the life of most of the 150 passengers, looked forward to with awe, and which will be looked back upon with the quiet consciousness that a life's work has been accomplished, only second in importance to the discovery of America by Columbus! Before leaving Havre there was a dinner on board the *Ferdinand de Lesseps*, at which were present all the *élite* of the automobile world, coming to Havre either by train or by automobile.

LAST week was a great week for the airships. The "Lebaudy" made a world's record for a distance covered in a single journey by automobile balloons, covering 98½ kilometres in two hours and 46 minutes—that is to say, doing 61 kilometres more than it accomplished in its famous voyage from Mantes to Moisson. It was just 4.46 in the afternoon when the crew of sixteen men having hold of the guide-ropes brought the famous "Jaune" out of its shed and on to the plain, with the pilot, M. Juchmes, and his two assistants on board. A few minutes past 5 o'clock the motor was started, and gradually turning quicker and quicker, the propeller caused the airship to glide up to an altitude of 200 metres in the air, and then, until 7.56, the airship continued travelling without any interruption or without the slightest deviation from its already fixed course, and covered quite successfully the journey which had been laid out for it; consuming about 13 gallons of petrol for a journey of 62 miles,

As for Santos Dumont and his wonderful No. 9, it now becomes such a common sight to the Parisians that he scarcely attracts any attention. He is constantly to be seen dodging about between his home in the Champs Elysées and his balloon shed at Neuilly. He even lands in front of his house in the Champs Elysées, although he chooses the early hours in the morning for this purpose, so as not to interfere with the traffic. In the meantime he pays calls to his friends in the country and comes down at the polo ground in the Bois de Boulogne, and plays all sorts of antics to show the practicability of his little airship. Santos Dumont is of course still working at a racing airship, but it is not yet completed.

THE Aix-les-Bains week, which consisted of a touring competition, began on the 27th June. The country where it took place, situated as it is at the foot of the Alps, was eminently suited to hill-climbing experiences, and constituted the greatest trial of endurance that could be devised. In other parts of the country one has to search carefully in order to find a difficult hill on which to test motor-cars; from Paris one must go out to Gaillon or to Chateau-Thierry, or to other hills, situated at a distance, more or less inaccessible on that account. But at Aix-les-Bains in every direction there are very difficult mountain roads, which are capable of testing the most powerful cars to their utmost, and proving that, notwithstanding what is said to the contrary, high horse-power is requisite to meet the requirements of automobile

The Aix-les-Bains Week—Guigon on Rochet-Schneider Car, leaving the Enclosure.

touring of the present day. Thirty-three cars took part in the trials. The whole competition was favoured with the most delightful weather, and not the slightest accident marred the event.

On the 15th inst. an interesting competition will take place at the laboratory of the Automobile Club of France, at Levallois-Perret. The competition will be for different carburants, and the following points will be taken into consideration: the consumption of a kilowatt per hour at different speeds, and the state in which the organs are after working for ten hours consecutively, and then resting for a night without having been cleaned.

AN Extra-Parliamentary commission has been appointed to look into automobile questions, and to advise on new legislation before Parliament. This committee will meet under the presidency of M. Michel Levy, Inspector General of Mines. It comprises amongst its ranks most of the present automobile manufacturers and experts. The questions which this commission will be asked to report on are the following:—(1) Is there any reason to limit by law the maximum speed on the level of automobiles coming out of the hands of the manufacturers, and if so, what should be the maximum legal speed on the level? (2) Is there any means of verifying the speed? (3) Is there any reason to admit of exceptions by individual authorisation for vehicles

exceeding the admitted speed? (4) Should speed trials on public roads be entirely stopped or exceptionally authorised? (5) At what maximum speed on the road does it become dangerous for the drivers of automobiles, when there is a sudden bursting of the tyre? (6) With what precision will the steering arrangements permit two cars to pass at different speeds? (7) Would it be possible or desirable to furnish cars with an apparatus for registering the speed, in order to remedy the inevitable uncertainty of appreciation of speed? (8) Should the number plate, which conforms to the decree of 1901, be maintained or not? Should not other means be devised to establish the identity of automobiles whilst they are running? (9) What are the causes of the noise, and by what means can it be remedied for both automobiles and motor-cycles? (10) What are the causes of the smoke and the smell, and can they be done away with? (11) How many and what brakes should be required for the different types? (12) What are the causes of the great dust raised by automobiles when they are running, and what can be done to diminish this trouble? (13) Would it be possible or useful to furnish automobiles with a cow-catcher, in order to avoid or diminish the effects of certain accidents? It will be seen by casting an eye over the above paragraphs that the Commission has some knotty and interesting problems to unravel.

THE hill-climbing trial from Susa to Mont Cenis, which has been so much looked forward to and so much spoken of last year, has been vetoed by the Italian authorities. A deputation has gone to Rome to see if anything can be done, but there is no likelihood of a successful result.

THE second day of the Circuit des Ardennes was devoted to the voiturettes and motor-cycles. The course was Arlon, Bastogne, Leglise, Martelange, and back to Arlon, a distance of 136 kilometres, which had to be covered twice, making 272 kilometres in all. In the voiturette section (250 to 400 kilog.) eleven finished out of fourteen starters, the race being a victory for Darracq cars, which secured the first two places. Appended are the times:—

Name.	Car.	Time.
Wagner	Darracq	3 55 27
Villemain	Darracq	4 27 53
Denis	De Boisse	4 39 26
Vilain	Prunel	4 39 44
Corre	Corre	4 43 34
Fournier	Clement	4 55 58
Masson	Clement	5 15 1
D'Aubignosc	Ader	5 31 48
Gautier	Ader	5 51 1
Persan	Corre	6 50 40
Heipel	Corre	6 51 41

In the motor-cycle section, out of thirty-five starters only eleven finished. Appended are the times:—

Rider.	Machine.	Time.
Demester	Griffon	4 59 46
Andre	Red Star (Gamage)	5 23 26
Kinet	Antoine	5 26 4
Momo	Pengot	5 29 39
Verechaer	Sarolea	5 30 7
Flamand	Minerva	5 35 1
Rene	Red Star	5 42 11
Barret	Bruneau	6 26 20
Dacier	Clement	6 23 9
Oster	Clement	6 30 58
Kerff	Sarolea	9 40 0

A MOTOR-CAR race, organised by the Automobile Club of St. Petersburg, was held near the Russian capital on the 21st ult. The distance was twenty-five versts, and this was covered by M. Kapouctine, the winner, in 31 minutes.

MESSRS. CLARKSON, LTD., of Chelmsford, have secured an order from Messrs. Debenham and Co., of London, W., for a number of travellers' automobile broughams, for use in connection with their well known business.

MOTOR-CYCLING NEWS.

A MOTOR-CYCLE record from John O'Groat's to Land's End has been established by Mr. J. Silver, whose time, despite persistent rain and heavy roads, was 2 days 29 minutes, including all stoppages for sleep and refreshments. This is 1 hour 16 minutes faster than the time taken by Mr. E. H. Arnott last year. Silver, who rode a 3-h.p. Quadrant, made two unsuccessful attempts before he accomplished the journey.

BELT troubles are in many instances no doubt traceable to the want of knowledge on the part of the user. When the belt is slipping, it is not wise to jump to the conclusion that it must be shortened; it should be detached and thoroughly cleaned with petrol from all dirt; this can be done with a tooth brush, which should be carried for the purpose, and the surface of the belt scraped clean with a blunt knife. Lastly, an occasional dressing of castor oil well rubbed in the belt over night will do good, and keep the leather pliable. The Ormonde Co. also recommend that the belt should be removed from the bicycle when resting for a period, this allowing the leather to lose its stretch.

LAST month half a dozen enthusiastic motor-cyclists met for the purpose of considering the advisability of forming a club in South London. Motorists desirous of joining should communicate with the hon. sec., Mr. W. L. Lorkin, at 223, South Lambeth Road, Stockwell, S.W.

ON the Canning Town track, last week, J. F. Crundall, riding a Humber motor-bicycle, established new records from two to thirty-two miles. The twenty-fifth was the fastest mile, this being covered in 1 minute 6 1-5 seconds, equal to 54 1/4 miles per hour. Ten miles were reeled off in 11 minutes 31 2-5 seconds, twenty miles in 23 minutes 8 3-5 seconds, and 32 miles in 36 minutes 56 seconds.

THE 200-mile reliability trial of the Motor Cycling Club for the S. F. Edge trophy took place early on Saturday morning, the start and finish taking place at Hatfield. Out of 20 entries, 14 riders were ready to start at 6 a.m. The first stage of the run was from Hatfield to Stoney Stratford, on the Holyhead road, then returning to Hatfield, making a distance of 73 1/4 miles. This was followed by a run to Hitchin and return to Hatfield, 100 1/4 miles. The 200 miles were made up by a run to Hertford and Wades Mill. The riders were started in groups of three, at intervals of a few minutes, the last group leaving at 6.20. As a result of the trials, three riders completed the whole programme with non-stop records, viz.: L. Jones, 1 1/2-h.p. De-Dion Clement tricycle; T. Silver, 3-h.p. Quadrant bicycle, and J. H. Keene, 2-h.p. Minerva bicycle. The majority of the stoppages in the case of the other riders were due to tyre troubles, punctures being the order of the day.

ON Saturday last the National Cyclists' Union held their annual championship competitions on the Canning Town Memorial track, to witness which some 8,000 persons assembled. The winner of the Five Miles Motor-Cycle Handicap was C. R. Collier, 15 seconds start. Net time 5 minutes 57 3-5 seconds. J. F. Crundall won the Three Miles Motor-Cycle Match. Time, 3 minutes 34 4-5 seconds.

A CAUTION board for motorists is to be placed at the London side of Alresford (Hampshire).

A COMPANY has just been formed in Warsaw, Poland, to start a motor-car service for the conveyance of passengers and goods in the Vistula district.

THE London County Council—who have been consulted on the point by the Local Government Board—have agreed to raise no objection to such an amendment of regulations as will enable motor omnibuses to be constructed of the same size as ordinary omnibuses, namely, 7 feet 5 inches in width. The maximum at present sanctioned is 6 feet 6 inches.

THE "THOMAS" FRICTION-DRIVEN PETROL CAR.

IN a recent issue a brief reference was made to a new friction-driven car which has been completed by Mr. W. F. Thomas, of Inkerman Street, Vauxhall, Birmingham. Since then, we have had a trial run on the experimental car illustrated herewith, and with a load of four passengers it not only ran well on

Fig. 1.

the level but took all the ordinary hills met with at a good speed. Two views of the car are shown in the accompanying illustrations Fig. 1 being a view from the rear with the cover removed to show the motor, and Fig. 2 a view of the gearing under the floorboard in the centre of the car. The engine comprises two cylinders, $3\frac{1}{2}$ in. diameter by 4 in. stroke, and develops about 8-h.p. The cylinders lie transversely across the car at an angle of 16 deg. from the horizontal, the one (E) having its head near the

Fig. 2.

frame on the left-hand side, and the other having its head further forward near the right-hand side of the frame. The piston rods of each cylinder are connected to a separate crank shaft, located beneath the breach of the opposite cylinder. Each crank-shaft carries a flywheel AA. Fig. 2, just in front of the engine. The flywheels overlap one another; they revolve at the same speed, but in opposite directions, to ensure which the two shafts are at their rear ends connected together by gearing, as seen in

Fig. 1. The forward ends of the crank-shafts are provided with telescopic and universally-jointed shafts, which are mounted in ball-bearings and terminate at their forward ends in friction pulleys having conical faces. The pulley X on its shaft is seen in Fig. 2, a similar pulley being also mounted on the other shaft. The bearings are so arranged that the friction pulleys can be forced towards one another or can be forced apart, and provision is also made by which they can be moved longitudinally. When brought towards one another they come into contact with conical friction discs mounted on the countershaft. As the pulley wheels are moved inwards towards the centre of the countershaft, so its speed relatively to that of the engine is increased. Both the pulley-wheels tend to drive the countershaft in the same direction. The changes of speed can be made gradually, and a considerable range is available. A reverse motion is obtained by forcing the two friction pulleys away from one another, so that they come into contact with the cone-faced wheels B on the countershaft. The power is transmitted from the countershaft to the rear wheels in the usual way by side chains. The pulleys are kept in contact with the discs by means of toggle joint and springs, which enable the same amount of pressure to be maintained between pulley and discs, whatever their relative positions may be. All thrusts are taken up by ample dimensioned ball bearings to reduce friction. The experimental car having proved satisfactory, we understand that Mr. Thomas is about to put a 10-h.p. vehicle and a 6-h.p. voiturette, both with the friction drive, on the market. The

Fig. 3.

former will have a twin-cylinder engine of the same form as that described above; but it will be placed beneath a bonnet in front instead of being behind, as shown in plan in Fig. 3. The smaller vehicle is to have a single-cylinder engine, giving 6-h.p. at 800 revolutions per minute.

Two of the steepest hills in the Lake District country, *i.e.* Kirkstone Pass and the Red Bank, were recently ascended by a 10-h.p. Wolseley with three passengers. Kirkstone Pass is a hill three miles long, and a dead climb of 1 in 6 and 1 in 7. The Red Bank is even worse, averaging 1 in 5 for just over half a mile.

THE Rowe Cycle and Electric Company, Cowgate, Peterborough, have recently taken over premises that have for the past fifty years been used as a carriage builder's establishment, as a garage. This will accommodate about twenty cars. Repairs are executed by competent motor mechanics, and a good assortment of spares are always in stock.

THE Corporation of Yarmouth have issued an attractive guide to their equally attractive resort. Motorists will be interested to know that the roads in the vicinity are good, and although the Norfolk police have lately shown an unpleasant interest in motorists, there is no doubt that this particular part of East Anglia will be largely visited on motor-cars during the present spell of fine weather.

HERE AND THERE.

SINCE the new automobile regulation went into effect in New Jersey 2,200 licenses have been issued.

WE are asked to state that there is no truth in the report that Messrs. De Dion Bouton and Company will take up the construction of a car designed by M. Leon Bollée.

THE Barnstaple Rural District Council has adopted a resolution to the effect that the present regulations with regard to motor-cars are thoroughly unsatisfactory, and a source of danger to wayfarers.

THROUGH the Board of Agriculture the Ordnance Survey have issued a folding pocket map of Chatham and the surrounding district. This is one of the series of maps issued by this department, and will be of special interest to motorists touring in that district.

FROM the Chief British Depot, 94, Victoria Street, S.W., we have received copies of the latest catalogues and price lists of Delahaye petrol cars, and Chaboche, French Gardner-Serpollet, and English Serpollet steam cars. Both lists are useful, giving as they do illustrations of various parts of the vehicles.

AT a meeting of the Halstead Rural District Council, resolutions have been passed that in any amendment of the law relating to motor-cars there should be no extension of the present speed limit of twelve miles an hour over rural district roads, and urging the necessity of some system of identification of motor-cars.

DUMFRIES, N.B., thirty-three miles north of Carlisle, is on the direct coach road, England to Glasgow, also the junction of the main road to Stranraer for the north of Ireland. To motorists it is, therefore, an important place of call. There are some half-dozen first-class hotels and garages of unlimited accommodation at 78, High Street, and 73, English Street, where Mr. Wm. Irving has recently made arrangements to supply petrol and lubricants, and to carry out repairs without delay.

THE welcome offered to motorists by the High Gosforth Park Company, Limited, at their race meeting at Newcastle last week, was well appreciated. Among the other cars which were in the Club enclosure were a 20-h.p. Napier, three 10-h.p. Wolseleys, one 5½-h.p. Wolseley, three 9-h.p. Clements, one 18-h.p. Beaufort, and a 10-h.p. Lanchester. The Northern Counties Motor Garage, of Pilgrim Street, Newcastle, had a man in attendance who was busy selling petrol, goggles, and other accessories. Altogether, owing to the fine weather, and a successful meeting, automobilists were well catered for.

ONE day last week we had a short spin on a 12-h.p. "Motobloc" car in company with M. Dombret, who drove the vehicle in the Paris Madrid race, and which has been brought over to this country by Messrs. Montague Hawnt and Co. Three of these cars were entered by the makers, La Société des Automobiles Motobloc of Bordeaux in the light car class of the international race, all of them reaching Bordeaux safely, and classified respectively Nos. 17, 20, and 21 in their category. The feature of the vehicles is the position of the engine, this being set in the forepart of the wood and steel frame at an angle of about 45 degrees to the horizontal, with the cylinder head foremost and uppermost. The motor comprises two cylinders, 120 mm. diameter by 120 mm. stroke, and runs at a normal speed of 900 revolutions. Another characteristic feature is the combined crank case and gear box, which are provided with a quick-detaching cover to allow inspection. Three speeds and a reverse are controlled by one lever, with direct drive on top speed. The sliding train of gear wheels is controlled by one fork. A single chain connects the variable gear shaft with the rear live axle. The car weighs only between twelve and thirteen hundredweight, and in Paris-Madrid averaged a speed of nearly forty miles an hour. Our short spin on the vehicle showed that it was not only an excellent hill-climber, but that it could be throttled down to run slowly and quietly in traffic.

LORD CHARLES BERESFORD has purchased a Baby Peugeot which he will take with him on his flagship.

NOTICE boards have been placed at the approaches to Brigstock, near Wellington, warning motorists to drive steadily through the village.

A SERVICE of motor-cars for the conveyance of passengers and parcels between Salisbury and Amesbury for Stonehenge and Bulford Camp commenced running on Monday last.

IN connection with the Henley Regatta, which is to be held on the 7th, 8th and 9th inst., a large official tent (the only one authorised by the Regatta Committee for housing cycles and motors) will be provided in the Regatta Meadows by J. A. W. Ratty, of Henley-on-Thames.

MANY are the old churches up and down the country which have recently been converted into motor garages. It has, however, remained for Mr. E. J. Coles to strike out in a new line, he having adapted an old fire station at 171, Great Portland Street, W., to the requirements of a motor-car depot and stable.

Accommodation is available for about ten cars, while provision is at hand for the charging of ignition accumulators, and the batteries of electrical vehicles. Mr. Coles is making a feature of hiring out cars, and has started a Thursday evening trip to the Crystal Palace, to enable visitors to enjoy the fireworks.

FOLLOWING up their successful experiment of a year ago, the Massachusetts State Highway Commissioners are using a large steam wagonette for inspection purposes. In a day's run recently, 73 miles were covered, in addition to a side trip of 15 miles. Boston was reached on the return journey early in the evening, the trip having been made in much faster time than could have been accomplished even with many relays of horses.

MESSRS. ANTHONY TREHERNE AND COMPANY, LIMITED, have issued the "Sporting Annual," a record of every kind of sport, including automobilism, cycling, yachting, etc. It is edited by Messrs. A. Binstead and G. Fitzgibbon, and will be found a useful volume on the bookshelves of every sportsman. A few good photographs add to the interest of the volume, but the list of motor-car firms might be brought up to date and expanded. Some interesting pages are devoted to miscellaneous records and dates.

THE IRISH SPEED TRIALS.

TO-DAY (Saturday) a series of speed trials will be held in Phoenix Park, Dublin. All the events will be run over the full course of one mile and one kilometre (2853·6 yards), from a standing start, in heats of two cars or six cycles. The following are the entries:—

CLASS A1.—Motor-Cycles up to and including 70 lbs.

Name.	Machine.	Name.	Machine.
-------	----------	-------	----------

C. J. Garrard Clement Garrard. B. Yates Humber.

CLASS A.—Motor-Cycles up to and including 114 lbs.

Name.	Machine.	Name.	Machine.
-------	----------	-------	----------

Ernest H. Arnott Werner. Harry Martin Excelsior.
 R. Samson Quadrant. Alfred Summers Triumph.
 T. Silver Quadrant. Sir Col. Kennard Werner.
 P. J. Dempsey Triumph. J. F. Crundall Humber.
 T. H. Wallen Triumph. Sam Wright Excelsior.
 E. H. Lancaster Ormonde. B. Yates Humber.
 J. Van Hooydonk Phoenix. A. C. Wright Ormonde.
 André Gommers Gamage. H. C. Hacking Ormonde.
 C. J. Garrard Clement Garrard. Henry W. Stones Rex.

CLASS B.—Motor-Cycles up to and including 170 lbs.

Name.	Machine.	Name.	Machine.
-------	----------	-------	----------

Wm. H. Yates Hobart. C. G. Garrard C. Gerrard.
 E. H. Arnott Werner. Harry Martin Excelsior.
 Donald McNeill Quadrant. J. F. Crundall Humber.
 Edwin Perks Singer. Sam Wright Excelsior.
 Capt. L. E. Kennard. B. Yates Humber.
 W. Weekes Crypto. Riley Cycle Co. Royal Riley.
 J. Van Hooydonk Phoenix. Riley Cycle Co. Royal Riley.
 L. R. Oswald. Excelsior. L. B. Tucker Rex.

CLASS C.—Tourist Cars costing £300 or under, which need not carry more than two people.

Name.	Car.	Name.	Car.
-------	------	-------	------

Henry Sturmeay 10-h.p. Duryea. Alfred Burgess 8-h.p. M.C.C.

CLASS D.—Tourist Cars costing over £300, but not more than £650, to carry four people.

Name.	Car.	Name.	Car.
-------	------	-------	------

Alec. Govan 16-h.p. Argyll. E. Brun 12-h.p. Prunel.
 Sir J. T. Thornycroft 20-h.p. Thornycroft. H. Belcher 12-h.p. Humber.
 H. Du Cros, jun. 12-h.p. Ariel. R. W. Buttemer 10-h.p. Decauville.
 Capt. G. Skeffington Smyth 15-h.p. New Orleans. Alfred Burgess 10-h.p. M.M.C.
 T. B. Browne 18-h.p. James & Browne. Capt. Neil Haig 16-h.p. Boyer.
 W. Lecoq 10-h.p. Renault. Prof. H. S. Hele-Shaw 24-h.p. Darracq.
 Frank Lanchester 10-h.p. Lanchester. E. M. C. Instone 12-h.p. Belgica.
 J. T. Overton 24-h.p. Georges Richard. G. E. B. Pritchett 12-h.p. Meteor.
 R. W. Leader 16-h.p. Century. A. G. Stevenson 20-h.p. Thornycroft.
 Frank Atherley 12-h.p. Magnet. James Wilson 18-h.p. Elswick.
 Arthur J. Clay 16-h.p. Decauville. H. Austin 12-h.p. Wolseley.
 J. Lisle 10-h.p. Light Star. A. E. Crowdy 24-h.p. Wolseley.
 Mawdsley Brooke 14-h.p. Brooke Tonneau.
 Chas. Baker 20-h.p. Dennis.

CLASS E.—Tourist Cars costing over £650, but not more than £1,000, to carry four people.

Name.	Car.	Name.	Car.
-------	------	-------	------

G. Cornwallis-West 20-h.p. Brush. Edw. Kennard 12-h.p. Napier.
 H. Du Cros, jun. 20-h.p. Ariel. W. J. Crampton 16-h.p. Decauville.
 J. W. Cross 20-h.p. Humber. Frank Barbour 10-h.p. Panhard.
 Hon. John Scott Montagu 22-h.p. Daimler. George Iden 20-h.p. M.M.C.

 E. Campbell Muir 60-h.p. Mercedes. H. Austin 45-h.p. Wolseley.
 Charles Jarrott 40-h.p. Napier. Lt. Mansfield 50-h.p. Wolseley.
 G. H. Olliver 40-h.p. Gardner-Serpollet. Cumming 60-h.p. Parsifal.
 C. Cordingley 40-h.p. Mercedes.
 C. Cordingley Star Racer.
 Baron de Forest 70-h.p. Mors.

CLASS L.—Scratch Race for the Autocar Challenge Cup.—Race for motor-vehicles of any power or weight propelled by any form of motive power (as described under Class L). Open to vehicles which are also running in any other classes.

Name.	Car.	Name.	Car.
-------	------	-------	------

J. E. Hutton 60-h.p. Mercedes. W. D. Fair 100-h.p. Gobron-Brillié.
 S. F. Edge 40-h.p. Napier. A. Turckheim 45-h.p. De Dietrich.
 S. F. Edge 40-h.p. Napier. Hon. C. S. Rolls Madrid Type Panhard.
 G. Higginbotham 60-h.p. Mercedes. Earl Shrewsbury 80-h.p. Panhard.
 E. Campbell Muir 60-h.p. Mercedes. H. Austin 45-h.p. Wolseley.
 Charles Jarrott 40-h.p. Napier. Lt. Mansfield 50-h.p. Wolseley.
 E. Lamberbeck 70-h.p. Car. Cumming 60-h.p. Parsifal.
 C. Cordingley 40-h.p. Mercedes.
 C. Cordingley Star Racer.
 Baron de Forest 70-h.p. Mors.
 R. Jackson 24-h.p. Buchet.

The winner will receive and become the holder of the cup, provided that if there are not three starters, the kilometre is covered in not more than 40 secs., equal to 55 miles per hour. The cup becomes the property of the owner of the car winning it two years in succession, or three times in all. Present holder: C. Jarrott.

CASTLEWELLAN HILL CLIMB.

On Tuesday, the 7th inst., the second part of what is called the "Irish Fortnight" opens with a hill-climbing competition on Ballybannon Hill, at Castlewellsan, and a race from Clough into Castlewellsan. The hill is about one mile in length on one side, with a rise of 300 feet. The climbing test will start from Murland's Factory, at the foot or middle of the two hills, and the cars make the best speed they can up past Ardnabannon House towards Clough. At a mark on the top of the hill the times will be taken, and the cars then pass on at their leisure to Clough, where they will be marshalled for the race back in the afternoon. The attention of visitors is called to the fact that the road from Clough to Castlewellsan will be closed to all traffic from 10 a.m. until the races are finished.

CLASS A.—Motor-cycles up to and including 114 lbs. (Four Miles Speed Trial.)

Name.	Machine.	Name.	Machine.
-------	----------	-------	----------

E. H. Arnott Werner. Sir C. Kennard Werner.
 T. Silver Quadrant. J. F. Crundall Humber.

C. Cordingley	Star Racer.	Cumming.	

A DRUNKEN DRIVER COMMITTED FOR TRIAL.

At the South-Western Police Court last week, Alfred Field, a motor-car driver, in the service of Mr. Rudolph Mayer, was brought up, on remand, charged with being drunk during his employment, and causing serious bodily harm to William Bettsworth. Mr. George Bell defended, while Mr. J. Duncan held a watching brief. The injured man attended the court for the first time since the occurrence, and he limped into the witness-box with the aid of a stick. He stated that on the evening of the 8th ult. he was training for a long-distance walk, and while proceeding along the Clapham Road with two cyclists he was knocked down from behind by the motor-car and dragged along for several yards. Evidence was given to prove that the prisoner with his car travelled at the rate of twelve miles an hour, and his approach was not signalled in any way. He was found to be in a drunken condition. Mr. Lane dealt with the prisoner summarily for the drunkenness, and imposed a nominal penalty of 1s. For causing bodily harm he committed him for trial, remarking that the injured man had had a providential escape.

THE EDINBURGH MOTOR CAR FATALITY.

At a pleading diet of Edinburgh Sheriff Criminal Court last week, Alexander Mack was charged with having on 23rd May, in Dalry Road, Edinburgh, being in charge of a motor-car, driven the car against Elizabeth Henderson, and killed her. Accused, who pleaded not guilty, was committed for trial.

CORRESPONDENCE.

PERNICIOUS TIPPING.

TO THE EDITOR OF *The Motor Car Journal*.

SIR,—“That’s a very satisfactory job,” and I was honestly grateful to the workmen who had done it. I tipped them. That was in my green days. Let gentlemen by all means pay a good price for good work, but let it be to the repairer himself who is employed. It is a most pernicious thing to tip workmen. I have known tips given, and subsequently the work was found imperfectly done, and it had to be done over again. But pay a good price to the repairer himself, and rely on him to see that work is done which may not expect further “tipping.” No doubt accidents have happened and motoring given up by some who found that for some reasons it was troublesome. But eliminate absurd interested customs, and there is no reason why cars should not go as satisfactorily as carriages. I say nothing about racing motors.—Yours faithfully,

J. C.

TREMBLER COILS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—If, as your correspondent, Mr. A. J. Cary, states, a non-vibrating coil will work satisfactorily with wipe contact breaker this should be very interesting indeed to your readers, as it enables them to dispense with the troublesome trembler. Independent of dispensing with a lot of worry they would also save money. One of the principal objects of the wipe contact and vibrating trembler is to give ease in starting the engine, the result of using this contact being that one gets a series of sparks instead of one only. How does your correspondent get along with starting? Can he run his engine slowly? Presuming he is mounting a hill and has to pull his engine up for some cause or other, will it take up again?—Yours faithfully,

JOHN CHILD MEREDITH, LTD.

MOTOR-CAR RACING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—“Mr. Nixon’s” letter only shows what croneous conclusions can be drawn from racing results. Messrs. Panhard and Levassor’s cars were more or less a failure in the Paris-Madrid, it is true, but to conclude from that that “for all cars an absolutely vertical engine is a necessity” is absurd. What Messrs. Panhard doubtless have discovered is that, for the hybrid position of engine adopted by them in the race in question, they have not yet got their lubrication system right. In other words, that what will do for an engine in one position will not do for it in another, and that it is not merely sufficient to adapt the same lubrication system as before when circumstances are altered. But it should not have required the expenditure of £30,000 and participation in a holocaust to show them that. Before Mr. Nixon condemns horizontal or inclined engines, let him note the performance of the Winton cars in the Gordon Bennett race—which will be over before this appears. These have eight cylinders to deal with instead of four, and if they get through without lubrication trouble, and more especially if one of them wins, which is quite within the bounds of possibility, we should be justified, on the basis of Mr. Nixon’s argument, in saying that “for all cars horizontal engines are a necessity.” But we should not think of doing anything of the kind. We should simply say that, whereas Panhard had his lubrication wrong, Winton had got it right, and that, all other things equal, one position is as good as another. Again, what about the Wolseleys in the Paris-Madrid? Although they met with accidents, they had no lubrication troubles on their fully horizontal engines, which simply proves what we said above, that it was Panhard’s lubrication system that was wrong, and not their engine position. So much for the lesson Mr. Nixon has learned from the race.

We would like to ask Mr. Nixon for his proof, that without racing “we would still have 8-h.p. cars weighing a ton, with fifteen miles top speed, tube ignition, solid tyres, tiller steering, &c.” This is merely assertion. Does Mr. Nixon think that without racing cars, constructors would have stood still? Not a bit of it. The 40 to 100-h.p. absurdities—which are absolutely useless from the tourist’s point of view—would not, perhaps, have been seen; but as the legitimate demand for higher power and for more satisfactory ignition, &c., has from the first been strong; the natural prize of good business following improved results would have got us very much to the same position as we are in to-day, if, indeed, we should not have improved upon it, because the trade would have been freer to follow the bent of its own initiative, instead of having felt bound more or less to follow in the ruts cut out by the racing vehicle. As an example, three cylinder non-vibrating engines, direct drive on top gear, throttle control, and silent exhaust, have been features of our cars since 1895 and earlier, but they attracted no general attention, and were ignored by the trade till a few months since, when some of the leading makers of racing machines adopted one or other of them, and now everyone is following suit. These, especially the three last, are all features of value, especially to the tourist and general car user, but their wider use and more general adoption have been absolutely held back by racing, for they were undoubtedly ignored at first because they were not features of the racing machines.

Doubtless, had we cared to spend an odd £100,000 or two in building racing cars, and racing them all over the world, we could have "rubbed in the ointment" sufficiently for some of it to have stuck before now, but as we did not do this, the automobile public generally has been, until quite recently—for six or seven years, in fact—deprived of the advantages of these features. That is what racing has done for us, and the only features it has encouraged are those of power and pace, and these have been developed abnormally until they have become man's master instead of his slave.—Yours truly,

THE DURYEA MOTOR-CARRIAGE COMPANY.

MOTOR BOAT RACE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Though not a member of the Marine Motor Association, I would like, as a user of a steam launch, to protest against limiting the number of hands on each boat to two, which I understand will be the case in connection with the forthcoming International race of motor-boats. I do not know whether it is the intention of the organisers to debar steam launches from running in this race, but I should say this will be the effect of the rule, for it is always customary in fast launches to have three men on board, viz., one for stoking, one for driving, and one for steering, and I see no reason why steam launches should thus be handicapped in favour of petrol.—Yours truly,

CHAS. S. ROLLS.

MESSRS. JONES AND CO., of Lichfield, write:—"At about 9.20 a.m., on Saturday last, a motor-car, with a white or cream tonneau body, mounted the footpath and knocked down some iron railings at the house of Mr. H. M. Morgan, in Saint John Street, Lichfield. One of the party dismounted and picked up something from the wreckage, from the near side of the car, and drove on their journey north, passing through Rugeley in about 20 minutes afterwards. The car was fitted with non-skidding tyres, with hollow places moulded across every few inches. Mr. Morgan called here with reference to the matter, and is naturally much annoyed, especially as they neither apologised nor left their card."

CLUB NEWS.

NORTH-EAST LANCASHIRE.

MOST unfavourable climatic conditions prevailed on the 20th ult., when the motor-run arranged by the North-East Lancashire Automobile Club took place, but seven cars were brought to the starting-point, Blackburn, notwithstanding. Occasionally there was some good running, but the disagreeable weather and the bad state of the roads interfered largely with the enjoyment of the ride, so that several of the members fell out on the way. Three cars reached the Grand Hotel, Morecambe, the appointed destination.

EASTERN COUNTIES' AUTOMOBILE CLUB.

ON Saturday last the Eastern Counties' Automobile Club had a run to Saxmundham. The first car to arrive at Wickham Market, the starting point, was a 13-h.p. Primus, driven by Mr. J. R. Egerton, of Ipswich. After this the other cars arrived quickly, until, besides the one mentioned, there were present—Dr. and Mrs. Rowe, of Ipswich, in their 5-h.p. Peugeot; Mr. G. V. Milbank, 6-h.p. De Dion; Major R. J. Carthew, 10-h.p. Wolseley; Mr. and Mrs. A. Hackblock, Delahaye; Mr. C. D. Castell, 10-h.p. Rex; Mr. H. Blomfield, 10-h.p. Boyer; and Mr. R. Page, 7-h.p. Panhard. Two motor-bicycles—one a Rex, ridden by Dr. Longworth, and a Bat, ridden by Mr. Lionel Vulliamy, completed the turn-out. After a short stay, caused by a punctured tyre, the start was made just after four o'clock for Saxmundham. There were no adventures by the way, and arriving at Saxmundham, everything was found prepared for the party. After tea many of those present spent a short time looking around the town, and afterwards started on the homeward journey.

THE NORFOLK AUTOMOBILE CLUB.

THE Norfolk Automobile Club had another meet on Tuesday last week, the venue being Eaton Grove, at the invitation of Mr. and Mrs. J. J. Dawson Paul, who had made every arrangement for the reception of a large gathering. Fortunately the weather was delightful, the charming grounds looked their best, and everything passed off with the greatest possible success. The party included Mr. J. J. Dawson Paul, 16-h.p. Napier; Baron and Baroness de Barretto, 20-h.p. Wolseley; Mr. and Mrs. C. Pearse, Dereham, Eagle motor-tandem; Mr. J. W. Howlett, Ariel tricycle; Mr. Harold Chamberlin, Yarmouth, 10-h.p. Brooke; Mr. and Mrs. W. R. Spelman, 6½-h.p. De Dion; Mr. and Mrs. H. L. Clark, 6½-h.p. De Dion; Mr. Ray, 5-h.p. Benz; Mr. and Mrs. P. Norgate, 4½-h.p. Eagle; Mr. and Mrs. Bradley, 7-h.p. Daimler; and Mrs. Rudd, Yarmouth, 4½-h.p. De Dion; Mr. de Poix, 7-h.p. Daimler; Dr. Perry, Reepham, 5-h.p. Wolseley; Rev. J. A. L. Fellowes, Bunwell, 3½-h.p. Benz; Mr. J. A. Mills, 10-h.p. Gladiator; Mr. G. N. C. Mann, 12-h.p. Gladiator; Mr. Estcourt, 14-h.p. Brooke; Mr. Garland, 4½-h.p. De Dion-Bouton; Mr. Griffin, 6-h.p. Daimler; Mr. and

Mrs. Francis Hornor, 10-h.p. Gladiator; Mr. Hubert Egerton, 6-h.p. De Dion; Mr. Walter Crawshaw, 14-h.p. Brooke; Mr. Williams, 4½-h.p. De Dion; Mr. H. Watts, 12-h.p. Daimler; Mr. T. Inglis Goldie, 6-h.p. De Dion; Mr. and Mrs. G. Sillem, 6-h.p. De Dion; Dr. and Mrs. Burton Fanning, 8-h.p. De Dion. A meeting of the Town Council prevented the attendance of the President of the club (Mr. G. M. Chamberlin). The members passed a very enjoyable time in exchanging opinions and experiences on the merits of the cars ranged on the lawn.

KENT AUTOMOBILE CLUB.

THE Kent Automobile Club, which, although only started a month ago, now boasts of over 100 members, had their first run to Gravesend on Saturday last, to accept the invitation of their Chairman and Mrs. Firth to tea. The weather was all that could be desired, and quite fifty members and guests assembled in the beautifully-shaded garden of their host. After spending a most enjoyable afternoon they departed on their homeward journey. The following members were present:—Dr. Firth (chairman), 8-h.p. Lucas; Mr. Skudder, 9-h.p. Darracq; Mr. Gardner, 15-h.p. Panhard; Dr. Smith, 4½-h.p. Benz; Mr. Hart, Daimler; Mr. Firth, 3½-h.p. Benz; Mr. Nash, 8-h.p. De Dion; Mr. Day, 6-h.p. De Dion; Rev. Cotton, 9-h.p. Napier; Mr. Hearn, 10-h.p. Clement; Dr. Dowding (hon. sec.) 8-h.p. De Dion; Mr. Morgan, New Orleans; Mr. Hall, 24-h.p. Darracq; Mr. Kenyon, 10-h.p. Panhard; Mr. Fraser, 6-h.p. De Dion; Mr. Gooch, 6½-h.p. Gladiator; Mr. Eagleton, Locomobile; Mr. Keetley, 9-h.p. Darracq; Mr. Shrubsole, 2½-h.p. Excelsior bicycle. The next meet will be at Lamberhurst to-day (Saturday).

POLICE TRAPS.

THE police have a measured quarter-mile at Standerwick, near Bristol. A MEASURED quarter-mile is marked out at Balls Hut, near Arundel, Sussex.

THE police have a measured distance 350 yards long at Wrotham, Kent.

MOTORISTS had better be careful in the Crowborough district, as the police are assuming a "warlike attitude."

THE Blackburn police have just secured their first conviction for furious driving, by means of a measured 740 yards.

A MEASURED half-mile at Eggborough, on the Selby to Doncaster road, has resulted in two furious-driving cases at Snaith.

A BATH correspondent has sent us the following telegram:—"Measured distance between 1½ and 2 miles from Bath on Upper Bristol road."

THE five cases at the Coleshill Police Court are the result of a measured quarter mile between Meriden Village and the Archery Ground, and a measured half-mile at Bickenhill.

A POLICE trap (East Sussex police), with electrical timing apparatus, was set up on Saturday last between Crowborough Beacon and the Crow and Gate public-house (Tunbridge Wells-Lewes main road). The actual trap is between the Crow and Gate and Sweet Hawsham.

THERE is a measured quarter-mile on the Oxford road in the wood one mile the Henley side of Nettlebed. The police have also a measured quarter-mile in the dip between Nettlebed and Nuffield, on the same road as above. There is also a measured distance on the London and Oxford road, via Wycombe, at the bottom of the hill the Oxford side of Stokenchurch by the Lambert Arms Inn.

BRINGING A CAR FROM THE CONTINENT.

IN the King's Bench Division, last week, before the Lord Chief Justice, the case of *Du Cros v. J. G. Smith and Company* was heard. This was an action for damage done to a motor-car. Mr. Schiller, who appeared for the plaintiff, said that the action was brought by Mr. Du Cros for damage done to his motor-car when it was being carried from Ostend to Dover. The defendants carried on business as a parcels express company, and Smits, the plaintiff's mechanic, delivered the car to them at Ostend for carriage to Dover. Smits crossed in the same boat, and when the car was being brought ashore at Dover the chute gave way and caused the damage in question. Smits gave evidence in support of counsel's opening.

The Lord Chief Justice, in giving judgment, said that the defendants were undoubtedly common carriers, and were responsible unless they could show that the damage was caused solely by the act of the mechanic. In his opinion, the chutes were not in a fit and proper condition for the disembarkation of the motor-car. There was negligence on the part of the defendants' servants in attempting to disembark the car without proper apparatus for the purpose, and his Lordship gave judgment for the plaintiff for the agreed amount of damages, £25.

REFUSING TO STOP.

LIEUTENANT J. L. P. RADCLIFFE, of the 5th Royal (Irish) Lancers, was last week fined £10 at the Ware Police Court for not stopping a motor-car when called upon to do so by a constable. He was also summoned for driving beyond the speed limit, but no conviction was recorded on that charge. The defendant did not appear, but sent a message saying that he would be in Ireland.

FURIOUS DRIVING CASES.

Bangor	Rt. Hon. Horace C. Plunkett	40-50	£5.

Where no alleged speed is given it is understood to be above the legal limit.
 * Motor-Cycle Cases.

COMMISSION ON SALES.

THE Court of Session action has been settled in which Thomas Richards Bradshaw, Dublin, sued the Hozier Engineering Company, Bridgeton, for three sums amounting in all to £181 18s., and alleged by the pursuer to be due him as commission on the sales of certain motor-cars effected by the defenders. The pursuer averred that in July, 1901, he entered into an agreement with the defenders to act as their agent in Ireland for the sale of Argyll cars. He stated that they sold three cars to gentlemen, not actually through his agency, but that the sales were really due to his having introduced these customers. The defenders denied that there were due to the pursuer the sums sued for, but they have now made him a payment of £120 in full settlement of his claims.

FURIOUS DRIVING CASES.

In the Bristol case against W. G. Crabbe the summons was for exceeding a speed of six miles per hour with a motor-bicycle and trailer.

In the case at Winchester against R. G. Cross, Police-constable Eales stated that the defendant's speed was forty-five miles an hour, but this, the defendant contended, was an impossibility with his 4½-h.p. car.

In the case against G. Dickson at Southampton the Chief Constable said that no one was allowed to go beyond a reasonable speed, and everyone who travelled over ten or twelve miles an hour he would bring before the magistrates.

In fining Mr. Louis G. Schwabe for driving at a speed of twenty-five miles an hour, the chairman of the Towcester Bench said the penalty was small, because defendant stopped when asked and gave his correct name and address. Impudent offenders would receive heavy punishment, which they hoped would be a warning to them.

THE Right Hon. Horace Plunkett, Minister of Agriculture for Ireland, was fined £5 by the Bangor magistrates, on Tuesday, for furiously driving a motor-car between Bethesda and Bangor. A solicitor appearing for him was instructed to admit that the rate exceeded the legal limit, but the defendant denied having driven at a furious pace.

At the Berkshire Petty Sessions at Newbury last week, Franz Steagwald, of Mount Street, Grosvenor Square, W., was fined £10 and costs for driving a motor-car along the Bath road at Midgham at the rate of fifty-eight miles an hour. The Chairman said that the Bench considered this was a bad case, as the car was travelling at the rate of an express train.

On Saturday last the Bath County Magistrates fined five motor-cyclists for furious riding. The penalty of £5 was inflicted upon Dr. Edward White, who did a quarter of a mile on the Warminster Road, which the police had measured, in thirty seconds. Defendant, after being stopped, sat down for two hours warning other cyclists as they came by that the police were there. As a result the police had to give up.

At the Retford Borough Police Court last week Thomas Carpenter was summoned for driving at a speed of more than twelve miles an hour. The Chairman said the Bench were of opinion that the cars were driven through the narrow streets of Retford at a very dangerous rate. It was very difficult to catch them, but when they did they were determined to make an example of them, and the offender in this instance would have to pay a fine of £10 and expenses, which they hoped would be a sufficient warning to him to drive his car at a reasonable rate.

THE police have now turned their attention to the more eastern parts of Sussex. At Whitsuntide five drivers were caught, their speed over a measured furlong having been timed by the electric chronometer. The defaulters were before the Battle Bench of Magistrates last week, when the explanation of the working of the new machine was not the least interesting part of the proceedings. At the request of the Bench the constable showed the Justices the timing apparatus, and explained how one man pressed a button to start the watch going as soon as the motor started the measured furlong, and how another at the other end pressed a button to stop the watch.

RED LIGHTS IN THE REAR.

At the Tonbridge Petty Sessions, Horace Otto Hall, of Tonbridge, was summoned for driving a motor-car without carrying a red lamp behind it, on May 31st.

Police-constable Groombridge deposed to seeing the defendant driving at 10.5 in the evening in question, without the lamp at the rear of his car alight.

Mr. Hall said he borrowed some matches of the landlord of the Dorset Arms, knowing the difficulty of keeping a lamp alight on the rear of the cars. He did not hear any whistling or calling, but got off at the station on his own account to see if the lamp was alight, and was actually lighting it when four policemen came up. He admitted his lamp was out at some part of the time. Defendant was fined 10s. and costs 10s. 1d., and the chairman said that he was mistaken as to the law: it was not necessary to have a lamp attached to the rear of the car. The Clerk: The lamp must show a red light to the rear.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be for the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

THE Motor-Car Journal.

VOL. V.]

LONDON, SATURDAY, JULY 11, 1903.

[No. 227.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE great race is over, and, as would be gleaned from our telegrams of last week, it was a stern contest the weaker competitors being gradually weeded out until one German, three Frenchmen, and an Englishman remained. The absence of Americans amongst the finishing cars has been a great surprise in motoring circles. Their lack of experience in great road races was a factor against their success, while they seemed somewhat careless in their methods of preparation. There was, for instance, a great contrast between the stern measures adopted by the German team in locking up their cars with the mechanics by their side at nights, and those of our cousins from across the Atlantic, as shown in the market place at Naas on the preceding day. Although Jenatzy was the winner, the French are to be congratulated on attaining the second, third, and fourth places, with the result that they have been awarded the team prize offered by the Hon. J. Scott Montagu. Unfortunately even Mr. Edge has been thrown out of the official return, some assistance rendered in pushing the car at Athy having caused the International Commission to withdraw his name from the list of competitors who finished.

Irish Experience.

THE Irish Fortnight is demonstrating as nothing else has shown that motor-cars are not necessarily murderous weapons invading the countryside as with spear and sword. Having regard to the number of motorists in Ireland, and the high power of many of the cars, there should have been scores of deaths and hundreds of injuries. But the death rate has not increased during the tour, nor has any injury been done to pedestrians. It is really because the drivers have been qualified, and have recognised the dangers attaching to heedless driving.

The Irish Trade.

THERE is no doubt that the motor fortnight in the Emerald Isle will give a great impetus to the automobile movement in the country. Soon after the legalisation of automobiles there was a great rush, and, it must be confessed, some very poor machines were sold in Ireland at very good figures. The result was much dissatisfaction and prejudice—even from those who were favourably inclined. Motor-bicycles have, however, maintained their sale. The automobiles now available are, of course, of more reliable calibre, but the newly-created prejudice continues. Many of the Dublin agents complain of a slackness of late, and at least one leading firm is contemplating crossing the Irish Sea to this side unless things brighten considerably. Possibly the effect of the Automobile Fortnight will be in this direction—especially as there has been a marvellous freedom from accident and everything has gone well.

An Echo of the Ardennes.

DURING the Phoenix Park speed trials on Saturday we had a chat with Mr. E. Lisle, who had had a rush from the Circuit des Ardennes to the Gordon Bennett course in Ireland. Comparing the two events, he pointed out that in the former contest speed could be carried right through, but in the Gordon Bennett race the fact that there were seven controls in a course of ninety-three miles considerably reduced the chances of anything like top speed being attained or maintained. We were glad to learn from Mr. Lisle that Mr. Prew, who met with so serious an accident in the Belgian race, is likely to be removed home in about a week from now.

A Club for Bury St. Edmunds.

FOLLOWING upon a preliminary meeting recently held at Higham, when it was decided to form an automobile club for Bury St. Edmunds and district, a meeting of automobilists was held at the Angel Hotel, Bury St. Edmunds, last week, for the purpose of electing officers. Mr. T. Shillitoe (Deputy-Mayor) presided. Mr. C. K. Moseley, hon. secretary of the Eastern Counties Automobile Club (of Ipswich), brought forward a suggestion on behalf of his committee, that the club formed in Bury St. Edmunds be affiliated to the Eastern Counties Club. He stated that when the last-mentioned club was formed in January this year, it was felt that various other automobile clubs would be formed in different districts of the county. It was, however, thought that if these clubs would place themselves under the parentage of the Eastern Counties Club—the affairs of each distinct club, however, being managed by its local committee.—it would be better for all. The Deputy-Mayor thought Mr. Moseley's suggestion was deserving of consideration, and it was decided to defer it to a future meeting. In view of this circumstance, it was agreed also to defer the question of the name of the club. In regard to the presidency, it was decided to ask Lord Iveagh to accept the office. A recommendation from the previous meeting, that the Mayor of Bury St. Edmunds should be Chairman of the Council, was accepted. The following were appointed on the Committee:—Messrs. T. Shillitoe, H. B. Collis, G. S. Cousins, T. H. Nice, and A. E. Stockbridge (Bury St. Edmunds), G. H. Verrall and O. E. Griffiths (Newmarket). Mr. Owen A. Clark was elected hon. treasurer, and Mr. Leofric Hunter hon. secretary. The headquarters of the club are the Angel Hotel.

Trouble at Hythe.

THE public motor-car service between Folkestone and Hythe has met with so much success that last week the Hythe Town Council granted licenses to two additional drivers. Unlike the public, the majority of the council do not, however, approve of the motor vehicles, for at the meeting last week the Mayor expressed the opinion that the motor-cars caused considerable annoyance to the inhabitants, and said that in the future he did not intend to grant any more motor licenses without the sanction of the Town Council, as there were quite sufficient

already. If they allowed such an abominable nuisance to exist, they would not be doing their duty. Notwithstanding the efforts of Councillor White, who pointed out that what has made Hythe was the vehicular traffic, and questioned whether the Council had a right to create a monopoly, a resolution was adopted not to grant any more licenses for public motor-cars.

The Motor-Car Bill.

◆ ◆ ◆
In the House of Lords, on Tuesday, the Secretary for Scotland introduced the long-expected Bill for the regulation of motor-cars. It takes the form of an amendment of the Locomotives on Highways Act, 1896, and its provisions may be summarised as follows:—(1) Cars will be registered under the direction of the county councils and the county borough councils. (2) Each car will be numbered, and will carry a mark indicating the area within which it was registered. Responsibility for the identifying mark being visible at all times is to rest with the driver. (3) Every paid driver must be licensed. No license will be required by other than paid drivers. (4) At present the maximum weight of an unloaded car is three tons. Under the new Act it may be four, or five tons when a trailer is used. (5) As to speed, the present authorised maximum speed will be maintained in urban districts. In rural districts local authorities will be left, under the supervision of the Local Government Board, to fix and proclaim a limit of speed each for itself. (6) The penalty for a first offence will be a fine not exceeding £20, or three months'

The Scene of Jarratt's Accident.

imprisonment. For a second offence the fine may run up to £50, or six months' imprisonment. Magistrates may send offenders to prison without the option of a fine, but the sentence may be appealed against. (7) Any person in charge of a car who is accused of reckless driving and refuses to give name and address, or gives a false name or address, will be guilty of an offence under the Act. The Bill extends to Ireland and Scotland as well as to England.

The Provisions of the Bill explained.

◆ ◆ ◆
In introducing the Bill, Lord Balfour of Burleigh said that many representations had been received as to the defectiveness of the existing law. One of the most unsatisfactory features of the present law was that it prescribed one rigid limit of speed utterly irrespective of the circumstances which might obtain in any particular place. Another cause of complaint was that at the present time there was no proper or satisfactory way of identifying the real offenders in many cases. As to the remedy which the Government proposed, the Bill provided that there should be a separate number fixed on each motor-car, as well as a mark indicating the local authority in whose district it was registered. The particular method of fixing the numbers and the details of applying other provisions would be effected by general regulations of the Local Government Board. It was not proposed that the drivers' licences

should be a test or guarantee of skill. There was no security that the most skilful man might not be the worst offender, because, relying on his skill, he took risks which a less skilful man would not venture to undertake. As to the question of speed, every one would be ready enough to admit that it was, perhaps, one of the most difficult and most controversial points which had to be faced with regard to this legislation. The real test whether the speed was too great or not was, after all, whether it caused any danger to the public or inconvenience to those who had a right to use the highway.

The Lords' Views.

◆ ◆ ◆
In the discussion which followed, Lord Granby gave expression to a general approval of the provisions of the Bill. Lord Rosebery was of opinion that all drivers of motor-cars, without distinction, should be required to obtain a licence or a certificate of skill. The Earl of Camperdown asked for information as to who was to be the judge of reckless driving. Were different regulations as to speed to be made with regard to each county, or was it intended that the Local Government Board should issue general regulations applicable to the whole kingdom? The Earl of Mayo said there was a notion abroad that motor-cars were going to run about and kill everybody. He should like to say that hundreds of cars passed through Dublin the other day and through the villages at a high rate of speed, and no damage

Jarratt's Car after the Accident.

was done whatsoever. As to the question of maximum speed, he thought it would be better to fix some limit of speed in the Bill rather than to leave it entirely to the local authorities. The result of the Irish race was to show that a foreign nation had introduced a car which was far ahead of any this country was likely to produce at the present time, and therefore he was anxious that no unnecessary obstacles should be placed in the way of the industry in this country. The Bill was then read a first time, and the second reading is fixed for Tuesday next.

Job Masters and Motor-Cars.

◆ ◆ ◆
MR. WALTER LONG, the President of the Local Government Board, was recently approached on behalf of the Jobmasters' Protection Association, and asked to receive a deputation on the subject of the Motor-Car Bill. General Laurie, M.P., was to have introduced the deputation, which claimed to represent 30,000 horse-drivers on the streets of London. Mr. Long, however, intimated that as the Bill had already been prepared it was too late to modify the first draft. He therefore asked that any suggestions the association had to make should be sent to him. Agreeably to this request the association have forwarded their proposals to Mr. Long, representing that they make them in no hostile spirit towards motor-cars and motorists, their only desire being to ensure such regulations as shall conduce to the safety of the property and

person of other users of the streets and roads. The following are the more important suggestions of the association:—(1) That all motor-cars be registered with numbers at back and front capable of being easily read, which numbers shall be illuminated at night time. (2) That all drivers of motor-cars, whether owners or not, shall possess a certificate for competent driving. (3) That penalties for offenders be increased. (4) That the clause in Article 1 of the Act of 1896 be amended with regard to the emission of steam or visible vapour, and that the police or any private individual shall equally have the power to summon offenders, and that penalties shall be imposed upon such offenders. (5) That it shall be made illegal for any person in charge of a car to keep his engine in motion whilst the car is kept stationary over three minutes. (6) That motorists using acetylene or any other high candle power lamps on their cars must provide such lamps with shades.

Motor Insurance.

A WRITER in the "Manchester Guardian" discusses at considerable length the advantages and shortcomings of motor insurance. Not the least difficult of the many perplexing problems which a motorist must face is that of choosing the best office in which to insure his car. Though drastic im-

extends the liability to make good damage sustained to the car through collision to damage caused by side-slip. At present comparatively few offices undertake liability for damage by fire, explosion, or self-ignition, and owners are compelled, if they desire such protection, to effect a separate insurance in fire offices. The rate of this class of insurance is 15s. per cent., but of late a tendency is noticeable in companies doing business of this kind to require owners to insure as far as possible up to the full value of their cars.

Some Defects.

TWO serious defects common to all motor policies may be mentioned. In the first place, no English insurance company is prepared to issue a policy which will follow the insured car wherever it may happen to be, a limitation which operates hard upon motorists in the habit of touring abroad. The chief reasons alleged for declining extension are, first, the vital difference between our own and Continental law in regard to the liability of drivers of vehicles for personal injuries, and secondly the increased expense such extension would entail in the number of agencies. Another much-needed reform in motor insurance is in the simplification of proposal forms. At present many of these are extremely complicated, and it is often a matter

Photo by]

The Tourist Section—the 12-h.p. Prunel (E. Brun) and the 10-h.p. Star (J. Lisle) ready to start
THE SPEED TRIALS IN PHOENIX PARK.

[Argent Archer, Kensington.

provements have been introduced into the system of motor-insurance during the past year, it is still very far from being wholly satisfactory either to insurers or assured. Motor policies as a rule cover three classes of contingencies—accidents to owners, accidents to the car itself, and third party indemnity. When, however, wider protection is desired, the respective advantages offered by the various companies become complicated. For simplicity of explanation, let it be supposed that an owner is prepared to expend £10 per annum on insurance. For this annual premium he will have a choice of benefits. One office will undertake the following indemnities:—£500 in the event of death to owner through accidental, external, violent and visible means whilst driving or being driven in or whilst mounting or dismounting from car; £3 per week during temporary disablement from any accident of the above nature (limited to 26 weeks); £500 for accidental damage through collision (excluding fire, tyres, lamps, and the first £2 10s. of any damage), with a limit of £100 for any one accident; damage from fire, explosion, or self-ignition up to £200, or value of car, if of less amount, in any one year; and claims by the general public (third party indemnity) for personal injury or damage to property up to £500 in any one year, with a limit of £100 for a single accident. Another office, in substitution for the indemnity against personal accidents and damage by fire, offers to defray all law costs incidental to third party claims, includes the first 50s. damage, and

of difficulty to ascertain without correspondence the amount of premium asked under certain conditions. As in all other branches of insurance, the company whose terms are the simplest and whose obligations are met the most speedily and liberally is the most likely in the long run to win and maintain the confidence of automobilists.

Agriculturists and Motor-cars.

MOTOR traffic on the public roads was the subject of a paper read by Mr. A. S. Lawson, at a meeting of the Boroughbridge Agricultural Society, held at Boroughbridge, Yorkshire, on Saturday last. The president, Major Dent, of Ribston Hall, was in the chair. Mr. Lawson said he had endeavoured to approach the subject with an open mind, as there was much to be said on both sides. We must every year expect to see more motor traffic on our roads, and he believed we should soon find that horses would treat them, as they now treated bicycles, with the greatest contempt. The great majority of motorists, he admitted, drove safely and carefully, but there were others—though he did not believe a large number—who were a positive danger to those using the roads, and those were the people who were making motorists so unpopular in this country. At the same time he thought that motors could with safety be allowed a greater speed than twelve miles an hour.

With all respect to County Councils, he would much prefer one law for all parts of the country. "Motor traffic," said Mr. Lawson, in conclusion, "must have a great future before it, and I should be sorry to see any Act passed which would do harm to the motor industry; at the same time we must always remember that our roads are for all, and all have a right to protection."

Some Views.

A DISCUSSION ensued in which various views were expressed, one member remarking that he would insist upon a person who was summoned appearing personally in court. "After the first offence, whether it was the Prime Minister or anybody else, I would give all these men who are bereft of common sense the option for twenty-four hours of a plank bed or going to a lunatic asylum." The President (Major Dent) considered that people who ride horses would soon get accustomed to the motor-cars, adding that in nine cases out of ten it is the man that shies and not the horse. Motor-bicycles, with their "Pop, pop, pop," and the smell of petrol, were even more alarming than motor-cars. His experience in meeting motor-cars had been very fortunate. He had never yet met a driver who had disregarded any signal from him to stop, or behaved in any way to wilfully cause him annoyance. Scorching with motor-cars would right itself in time, as it had done in connection with bicycles. He had all along held that it would be the wisest thing to abolish the speed limit, and enforce the common law of the realm, which prohibited a man from driving at a speed that interfered with the comfort or safety of the public. He had always objected to the so-called "police traps," which were almost invariably on the safest parts of the road.

The Speed Question.

WE are inclined to agree with the remarks made by Mr. Arthur Duncombe at the last meeting of the East Riding of Yorkshire Quarter Sessions. He denounced the reckless driving that is going on in many places, and suggested that the county councils should have the power delegated to them of dealing with the matter. While we want to see some uniform system prevail we recognise that local conditions vary, and hence Mr. Duncombe's idea is not to be lightly put on one side. In Ireland, during the last few days, scores of cars have driven along country districts at rates ranging from fifty miles an hour onwards; while hundreds have been allowed to run at thirty and forty miles without hindrance. In fact the counties about Dublin have seen such an orgie of fleet travelling that accidents should have been numerous. But none have occurred, and save for an old goose or two nothing has been injured. The danger to the public comes not from speedy travelling but from the reckless driving often indulged in by novices—and it is against this that motorists generally as well as the public must be protected.

Motor Traffic.

MR. J. C. HAWKSHAW, M.A., the president of the recent engineering conference at the Institution of Civil Engineers made some interesting remarks on the subject of road locomotion in the course of his presidential address. As regards the best means of passenger transport, he pointed out that they had experience of how the advent of railways checked the progress of canals and also of motor-vehicles, which were far advanced nearly a century ago. "It is to be hoped that tramways will not again check the progress of motors and their use. Tram-lines render roads less suitable or serviceable for all other kinds of traffic. It is well worth considering whether it would not be advisable to make roads suitable for motor traffic of all kinds, and let motor-cars serve public as well as private purposes. Railways afford greater facilities than canals, but automobiles offer greater facilities than either railways or tramways, and though all three are necessary, nothing should be allowed to check the legitimate development of motor traffic—a suggestion which will meet with the approval of all motorists."

Railway Strikes and Motor-cars.

THE strike of the Victorian railway engine drivers and stokers was a serious matter. From our correspondents, Messrs. Phillips, Ormonde and Co., of Melbourne, we learn that for some days it was impossible to communicate with the country, with the result that the principal dailies instituted a motor-car service whereby their papers were conveyed to the interior. Some good records were made by these cars, one of which was a de Dion-Bouton and another a Decauville. Mr. Syd. Day, Mr. C. B. Kellow, and Mr. H. B. James, of the Commonwealth, all distinguished themselves in connection with the event.

A LANCHESTER car was used by the Automobile Club for laying the electric cables for the timing arrangements during the Gordon Bennett race. The cables were mounted on the rear platform of the Lanchester car, and this method of laying the cables proved to be a great saving of time to the club officials.

At all the leading hotels great crowds of motorists were seen last week, and the Shelburne presented quite a desolate appearance on Monday after the departure of the motorists for northern roads. At the Metropole, Jury's, and other well-known hotels, the buzz of motors was heard every day last week, and at the Standard, in Harcourt Street—with Dr. Lane Joynt, the motorist, as a neighbour—a score of automobile pressmen were located. There, too, have stayed M. Adrien Panhard, and M. Barbaraux, as well as several British motorists of distinction.

MR. EDGE had a great reception from the crowd outside the Shelburne Hotel on Monday as he drove off on his big racer to Newcastle for the Castlewella competition; in fact, all the competitors have been well received wherever they have appeared in Dublin, irrespective of nationality.

AN amusing incident occurred in connection with the trials in Phoenix Park on Saturday. All ordinary vehicles were stopped from entering by the usual gates. The viceregal party were, however, just passing our representative, who was anxious to reach the Club enclosure without walking. He mounted a jaunting car and ordered the jarvey to drive close to the Lord Lieutenant's carriage and in advance of the accompanying detective on a bicycle. The ruse succeeded, and a long walk was saved, and that was something on such a hot day.

SUPERINTENDENT EGERTON, chief of the City district of the Metropolitan Fire Brigade, met with a motor-car accident on Thursday last week. When he was returning from Clapham Common his car skidded in Kennington Park Road, and he was thrown out on the pavement and badly shaken and bruised. Immediately afterwards one of the electric trams crashed into the car, which was much damaged.

A RATHER alarming accident to a motor-car occurred at Renfrew on Thursday last week. The motor-car was proceeding down a steep road to the ferry on the Clyde, when the brake failed to act. The motor dashed at high speed through the ferry gate and into the River Clyde. The occupants—two gentlemen and driver—were pitched into the water. All three were rescued by the ferrymen, but the car sank. Fortunately no passengers were on the staging, otherwise the result might have been disastrous.

WE regret to announce the death of Mr. Paul Hardy, well known in Metropolitan cycling and motoring circles, which took place last week, at the age of 59 years. The deceased was the English representative of a number of Continental automobile papers. The fatal illness was of short duration, and after undergoing an operation, it was thought that he was progressing satisfactorily. Another operation being necessary, it was then found that little hope remained, and that the end could not be long delayed. His death ensued on Wednesday last week, he having been conscious almost to the last. To his friends and relatives we offer our deepest sympathy.

The Gordon Bennett Cup Race.

M. Jenatzy, the Winner of the Race, on his Mercedes.

LAST week we were able to give our readers a full report of the start of the race and also of the earlier incidents—up to, in fact, the afternoon. The *Journal* was on sale in Ireland by seven o'clock the following morning and eagerly scanned by motorists throughout Dublin for authentic news of the previous day's thrilling experiences. Our correspondent at Ballyshannon, who watched the progress of the contest with a view to an early publication of the probable result, telegraphed at 11.26 a.m.—as printed on page 346 last week—that "Jenatzy, De Knyff, Farman, Gabriel, and Edge are leading," and, although that was some hours before the end of the race, it ultimately proved to be the correct order of the finish, as given by the members of the International Commission.

THE RACE.

The race was a great one, and, although only five out of twelve finished the Course, it will prove a conspicuous event in the annals of British automobilism. Naturally we should have liked to have seen the Cup retained by Great Britain, but the mishaps to the English competitors and the failure of the Americans left the conclusion between France and Germany. As a team the Frenchmen did extremely well, securing second, third, and fourth positions, but the splendid driving of Jenatzy and the merits of the Mercedes well deserved the position so brilliantly won. Already the daily papers have recited the details of the contest, and the way in which the Irish journalists wrote column after column should be recorded with a tribute to their literary powers.

It was not an easy matter to follow the progress of all the competitors. Near the Grand Stand—a crude structure, with the flags of the competing nations fluttering from the topmost pillars—was a huge blackboard on which were recorded from time to time the records made by the competitors for the various circuits. But, as only one column was allowed, there was no opportunity for comparison, while the figures relating to Nos. 10, 11, and 12 could not be seen from the opposite side of the road owing to the

obstruction of a tall hedge. Such hedgerows had been cut down on other parts of the Course. Why they were not removed for a dozen feet at that point was a mystery to all—save those responsible for such an arrangement. The convenience of the Press was entirely ignored; the timekeepers' tent was on one side of the road, and the telegraph office located on the other, a tiresome walk over long grass being necessary for the despatch of telegrams. It had been decided to have Press stewards at all the controls, but even these were abandoned at the last moment, and the task of the journalists was rendered all the more difficult. Of course those gentlemen familiar with the usual methods of the Automobile Club with regard to the newspaper world were not surprised, but representatives of the daily press could not refrain from instituting comparisons between the arrangements for this international event and any local horse affair.

The police worked well. When we speeded round the Course at daybreak on Thursday—ours being the last car to complete the circuit before the pilots—the Constabulary were getting into position, and everywhere, with the single exception of the Kildare control, nothing but praise could be heard as to the way in which the police performed wearying and tiring duties. Continental competitors were loud in their enthusiasm over the complete way in which the roads were guarded, and the method in which the Course was kept was a revelation to motorists from other countries.

Motor-cyclists did stalwart work in returning the vouchers of the competitors from Killecullen to Ballyshannon, and it is regrettable that many complaints of the incivility of officials were heard. Certainly the way in which the road stewards were cleared from the Course at the start was brusque, and we would remind our Irish contemporaries who have dwelt on these points with some severity that the man "armed with a little brief authority" is somewhat apt to exaggerate his importance for the moment. To that we attribute most of the complaints that have been made,

The first control was at Castledermot, where Jarrott and Gabriel both over-ran the line and had to employ their reverse. Edge drew up in the best style, his machine stopping dead.

on the Course. Jenatzy led De Knyff on the third round, and Gabriel's time showed an improvement.

At Carlow there were some exciting incidents. The Rt.

The Grand Stand—Included in the Group to the right is the Earl of Dudley, the Lord Lieutenant of Ireland (with book in hand). In the foreground (in straw hat) is Lord Plunkett.

Jenatzy, just about to start. Baron de Caters wishing him good luck. Georges Prade is immediately behind the Baron, while Hieronymus, [one of the reserve German team, is seen at the rear of the car.

(Photos by)

[La Fayette, Dublin.

One of the tyres of Stocks' machine was beginning to wear. On the second round De Knyff was first, Edge being delayed by a puncture four miles away. De Caters reported the accident to Jarrott, which was soon known at all the important places

Hon. H. Bruen had erected a grand stand for his friends, and an animated scene was presented to the competitors as they travelled round. At Ballymoon corner, not far away, De Knyff dashed into a wire fence, but pulled up in ten yards and got away.

Stocks was less fortunate at the same point, his car being completely overturned by rushing up the bank. Mr. Bruen drove him in his into Carlow, where he became a spectator of the event. De Caters also collided with the wire near the same spot.

Athy has been prominent throughout the time of preparation for the race. There the English team had their headquarters, and both the Panhards and the Germans occupied

the cars were passing through the control the third time a lad ran into the roadway to watch De Knyff's car glide away. Jenatzy came along, and although he tried to steer clear of the boy, failed, and knocked him over. The lad was taken to the infirmary.

Monasterevan gave only a limited view of the cars, and was not a control of popular resort. De Knyff complained of his steering gear at the first round, and it was seen that Foxhall

Jenatzy entering the Athy Control.

[Argent Archer, Kensington.

hotels there the few nights before the race. Just after leaving the control the gearing of Mooers' Peerless went wrong, and his car lay helpless on the roadside at least half an hour.

Kildare presented a very busy scene indeed. At the second round Edge reported that burst tyres had been the cause of his delay, and Winton missed his road across the Curragh. Having no reverse, he had to run round over the grass. While

Keene's axle was bent. Edge had tyre troubles two miles away

The first excitement at Stradbally was the news of the accident to Jarrott, which happened near the Rock of Dunamais, and to which we make reference elsewhere. Winton's car had been working very badly, and did not arrive till 12.35. Gabriel's cylinders, too, were not up to their usual form, and he was in trouble from that cause. De Knyff had bad luck at Stradbally.

(Continued on page 365.)

THE WEIGHING IN AT NAAS.

Mr. C. Cordingley's Mercedes.

Gabriel Watching his Car being Weighed.

The gross times recorded for each competitor in going the rounds of the various circuits were as follows:—

Name.	1st Round.	2nd Round.	3rd Round.	4th Round.	5th Round.	6th Round.	7th Round.
	H. M. S.	H. M. S.	H. M. S.	H. M. S.	H. M. S.	H. M. S.	H. M. S.
Edge	1 23 23	1 37 31	1 55 59	1 54 59	1 42 35	1 46 01	50 0
De Knyff ..	1 33 47	1 32 31	1 18 57	1 38 16	1 19 40	1 33 39	1 38 41
Owen ..	1 33 57	1 45 26	—	—	—	—	—
Jenatzy ..	1 26 58	1 31 19	1 17 45	1 31 52	1 21 16	1 31 32	1 37 19
Jarrott ..	1 25 14	—	—	—	—	—	—
Gabriel ..	2 15 10	1 30 19	1 30 31	1 34 20	1 19 41	1 43 58	1 35 5
Mosers ..	3 11 10	—	—	—	—	—	—
De Caters ..	1 27 17	1 38 42	1 19 11	1 37 19	1 19 21	1 38 16	—
Stocks ..	No return.						
Farman ..	1 24 31	1 40 27	1 17 35	1 35 55	1 18 31	1 38 17	1 31 31
Winton ..	3 23 24	3 4 26	—	—	—	—	—
Keene ..	1 23 31	1 54 8	1 39 0	—	—	—	—

It will be seen that on the first round Foxhall Keene made the best time, Edge being only 20 sec. behind. Farman made the running on the third circuit, while Gabriel gained on the fifth, Farman again doing well on the last lap—better, in fact, than Jenatzy. Gabriel lost much on the first trip, and Jenatzy and Farman deserve recognition for their consistent running throughout.

Some sensation was caused in Dublin on Monday when it became generally known that the International Committee had disqualified Mr. Edge for the fifth place which they had awarded him in the Gordon Bennett race. They found it proved that in his case the rules had been violated by the fact that his car had received assistance by pushing in the Athy control. The effect of this decision was that no English competitor was officially recognised as having finished in the race, and naturally it was

Jenatzy Rounding the U-corner at Kilcullen.

Winton at Kilcullen Corner.

[Argent Archer, Kensington.]

Photo by]

On Friday the International Commission met in Dublin and awarded the Gordon Bennett Cup to the German Automobile Club, at the same time announcing the times of the various competitors as follows:—

NAME.	H.	M.	S.
M. Jenatzy
M. de Knyff
M. Henri Farman
M. Gabriel
Mr. S. F. Edge

M. Jenatzy's time thus works out at 49½ miles per hour, an advance on last year's speed, and, considering the sinuous and dangerous character of the Course, a very good rate.

received with regret throughout Ireland, where the English team had become very popular.

MISHAPS.

Seeing that only five competitors out of twelve completed the course, it would appear that the proportion of mishaps was something considerable, and, as a matter of fact, the personal element in the contest comes out strongly. None of the Americans had had experience of such long racing—and none finished. Stocks did not show up conspicuously in his first great contest, and De Caters did not seem to be driving for the Cup. All the Frenchmen finished, and Edge and Jenatzy, so that it would appear that experience counts for much.

(Continued on page 367.)

SNAPSHOTS ON THE COURSE.

Winton at the Athy Control.

Photo by]

Edge and De Knyff waiting to start at the Athy Outward Control.

[Lawrence, Dublin.

Of the accidents, that to Jarrott's car was the most serious. Discarding the rumours that were flying about Dublin, we had a chat with the hero of the mishap himself on Friday morning, and were able to congratulate him on the fact that the mishap had been no worse than it was. The wonder really was that he was alive to tell the tale, for his car was reduced to a greater state of wreckage than was the vehicle driven by the late Mr. Loraine Barrow in the Paris-Madrid race. Near Stradbally the car became unmanageable, and dashed up a bank about ten feet high with a tall hedgerow at the top; then, descending backwards, the plucky driver was thrown, sustaining a broken collar-bone, a scalp wound, and bruises everywhere. The car then rushed madly a few feet, and overturned, crushing young Bianchi, the mechanic, underneath. Jarrott himself was lying dazed a few feet away, his head bleeding, and altogether a picture of misery. He managed to rise to try to help his mechanic, when a policeman challenged his right on the road. "I am a competitor," he replied, "and the road is my proper place," although the humour of it was not apparent to him at the time. Gaining a little strength from his determination, he was able to extricate Bianchi, and De Caters, coming along, offered help. Jarrott ordered him forward; and it speaks well for the true manly feeling of the Belgian Baron that he stopped at Ballyshannon to inform the officials of Jarrott's sad plight. Doctors were despatched, but Jarrott was almost in a state of collapse, and the first definite recollection he had was of some of his hair being cut away with a blunt penknife. The collar-bone was set, and in an hour he was puffing away at a cigarette with characteristic coolness, though with a pallor that told of his sufferings. Although looking fairly well on Saturday, he bore traces of his accident, and it will be some days before he will be himself again. Bianchi's body is a mass of bruises, although by the time these lines are in print it is hoped he will have been removed from Athy.

Near where Jarrott's accident occurred the Peerless car driven by Mooers went to pieces. Fortunately nothing beyond the shock of being precipitated into a field a few feet from the car happened to Stocks, but through running into the wire netting his car was placed out of the contest, and a bent axle compelled the retirement of Foxhall Keene.

THE FINISH.

[DELAYED IN TRANSMISSION LAST WEEK.]

It is 5.30, and we are expecting a winner. De Knyff and Jenatzy are on their last journey, and a stern shower has driven all but the most intrepid to tent and to shelter. With Hieronymus—the Mercedes reserve man—and others, we stand upon the sloping bank at Ballyshannon. Field-glasses are directed up the straight road towards Athy, and then the screeching hooter from an adjoining field announces that a car has passed the Moat of Ardsnull. All rush from tents—ladies in dainty summer raiment forget the rain in their anxiety to see the driver, and across the long grass they run with enthusiastic energy. A black speck appears upon the road. Its straight course is clear; it grows as it comes between the avenue of tall trees, and when it emerges into the less sheltered roadway it is evident that it is De Knyff, the straightest driver of the lot. Mr. Basil Joy rushes out as the bearded Frenchman comes down the hill, and frantically waves the flags that indicate the completion of the long race. Nothing slackening, De Knyff comes crashing up the hill, and disappears below the Grand Stand in a mad fury, desirous of gaining to the last. We compare watches, we glance at the clock, we calculate from scoring-sheets. Should Jenatzy come within the next fourteen minutes the Mercedes will have won. And unless some untoward happening takes place, Jenatzy will come along soon. The German contingent become anxious with an anxiety that leads to silence. Dick Farman and the Frenchmen talk with bated breath, and strain their eyes up the long hill. Then the hooter sounds forth again, and the craning of necks is almost painful. The black speck appears, and here is Jenatzy—a veritable fury let loose. He comes by the time-

keepers' tent, a picture never to be forgotten. His prominent features are silhouetted in the darkening afternoon, and with his cap blowing wildly in the breeze, his gaunt fingers clutching madly at the steering wheel, his eyes almost coursing from their sockets, he would do for one of Sir Henry Irving's impersonations of some wild courser from the nether regions. A mighty cheer ascends, Earl Dudley and his staff come forth, and Jenatzy, throwing his long arms into the air, is told he wins. The Germans become wilder and wilder in their joy; the mechanic tries to dance, but the strain of the last ten hours is upon him, and it is but a feeble and unnatural performance. There is nothing left to wait for now, but the three whose chances of premier position have been receding all the afternoon. And we wander back to Ballyshannon House to shake hands with Jenatzy before his car is weighed in.

He had hardly dared to win, and it was not till the third round that the probability of success dawned. Then he went for all he was worth. His most exciting moment in the race was when trying to pass Owen at Kilcullen. In the grounds of Ballyshannon House we met other competitors. Henri Farman was there, having ridden his last great race. De Knyff, too, is not likely to race again. Percy Owen came along, plucky and game, but outclassed by the veteran riders around. All bore evidences of the tension through which they had passed.

THE DAY AFTER THE RACE.

Friday was made tedious and wearisome by the weighing-in process—an uninteresting, necessary performance carried out at Guinness' Brewery, within the area perfumed by the sadly flowing Liffey. A long delay was occasioned by the absence of the officials, who, although the weighing-in hours were only from 11 a.m. to 3 p.m., seem to have indulged in a gently extended period of refreshment while a score of cars were waiting to be put upon the weighbridge. Even such a process, however, must have an end, and right glad were all concerned when the event was concluded. Why cannot the official in charge be provided with a printed list of entrants with columns ruled for the various notes required? Such a plan would facilitate reference, and have saved much waste of time not only on Friday but also at Naas the preceding Wednesday.

Weighing over, we decided to retrace our tracks to Kilcullen, to see what stragglers were coming towards town. The climatic conditions were a combination of fair and foul in regular alternations towards Naas, when the clouds cleared. On the way a dozen cars were noticed *en panne*, and all the Panhards and Mors relief cars were seen merrily rushing to Dublin—piled up with tins, etc., as well as with cheery workmen, who seemed more dampened by the rain than by the loss of the race. But doubtless they were hiding their feelings in this foreign land.

At Kilcullen we learned many tales of woe; how motorists had broken down and had to seek temporary refuge during the night in strange places. There was general depression at the loss of the English team—for not only does this mean the loss of the Cup, but it means no return of the abnormal prosperity that has delighted the neighbourhood these last few weeks.

It is now settled that the feature of the forthcoming visit of the King and Queen to Ireland will be the motor-car tour, which has now been extended as far west as Galway.

THE cinematograph was busy during the race, and on the evening of Thursday last animated photographs of the scene on the course were shown in the Dublin music halls.

UNFORTUNATELY the telegraphic arrangements in connection with the race were meagre in view of the importance of the event, and in common with others we were seriously handicapped in consequence. A telegram descriptive of the weighing in at Naas on the previous day occupied four hours in reaching London, and 500 words despatched from Kilcullen on the morning of the race arrived late and terribly twisted. There was evidently a blockage at Dublin, or we should have been able to have carried through our intention of giving the result in last week's issue.

Speed Trials in Phoenix Park.

Photo by]

View of the Course in Phoenix Park.

[Argent Archer, Kensington.

"Dear dirty Dublin" looked its best on Saturday, when we forgot the murky Liffey in the brilliance of the sun glare, and all the dusty troubles of the preceding days vanished before the beauty that gathered in the Phoenix Park. We had been surfeited with views of rural poverty, struggling decency, and the miserable existence of county Kildare; and round about the scene at the Speed Trials was a revelation of bright sparkling eyes and beauteous forms that gracefully trod the greensward and smilingly greeted the motorists as they dashed along the straight course, apparently oblivious of the delightful visions all around. But the way the drivers found their way to the Club enclosure when their heats were run was significant.

The Phoenix Park is a delightful space, with a variety of aspects such as are possessed by few similar places on the other side of the Irish Sea. The curious Phoenix pillar, from the foot of which the surrounding slabs had been removed for the straightening of the course, was erected by the Earl of Chesterfield in 1747. The acreage is 1,752 acres, and although nearly two thousand trees were blown down by the storm in February last, its well-wooded aspect is still conspicuously maintained.

On Saturday the competitors entered by the Castle Knock Gate, and were started from a point which allowed the kilometre to end just before the Phoenix was reached, and the one mile one kilometre about midway along the Club enclosure. At the further end of this was a heavy barrier obstructing the public view near Lord Gough's statue. Thus sufficient length of roadway was left for the speediest racing cars to draw up. The spectators were kept fifty feet from either side of the roadway by a fence, thus reducing to the minutest minimum any risk of danger. Along the raised footpaths from which the public were excluded motor-cyclists flitted all the afternoon, carrying messages and facilitating the work of the organisers of the contests.

The results of the various events were as follows:—

MOTOR-CYCLE SECTION.

CLASS A1.—Motor-Cycles up to and including 70 lbs.

Name and Machine.		Name and Machine.	
C. G. Garrard (Clement Garrard) ..	1	Bert Yates (Humber)	0
Time—2 mins. 53 3-5 secs.			

CLASS A.—Motor-Cycles up to and including 114 lbs.

Preliminary First Heat.

Name and Machine.		Name and Machine.	
T. C. Furlong (Werner)	1	R. Samson (Quadrant)	0
Time—2 mins. 33 4-5 secs.			

Second Heat.

J. F. Crundall (Humber)	1	Alfred Summers (Triumph)	0
Henry Stones (Rex)	2	Time—2 mins. 12 1-5 secs.	

Third Heat.

Andre Gommers (Gamage)	1	C. G. Garrard (Clement Garrard) ..	3
A. Wright (Ormonde)	2	A very close contest. Won by four lengths; third a long way off. Time—2 mins. 5 secs.	

Fourth Heat.

C. W. Hacking (Ormonde)	1	Time—2 mins. 0-2-5 secs.	
-------------------------------	---	--------------------------	--

Final.

Gommers (Gamage)	1	T. C. Furlong (Werner)	3
J. F. Crundall (Humber)	2	Time—2 mins. 16 1-5 secs.	

CLASS B.—Motor-Cycles up to and including 170 lbs.

First Heat.

Name and Machine.		Name and Machine.	
B. Yates (Humber)	1	Hon. Captain Ruthven (Singer) ..	3
W. H. Yates (Hobart)	2	Time—2 mins. 15 secs.	

Second Heat.

Harry Martin (Excelsior)	1	J. F. Crundall (Humber)	2
Time—1 min. 59 1-5 secs.			

Third Heat.

S. Wright (Excelsior)	1	R. W. Ireton (Riley)	0
F. W. Chase (Chase)	2	Time—3 mins. 1 4-5 secs.	

Fourth Heat.

W. H. Burden (Riley)	w.o.	Time—2 mins. 33 1-5 secs.	
----------------------------	------	---------------------------	--

Fifth Heat.

H. Prickett (Riley)	1	W. Weekes (Crypto)	2
Time—2 mins. 7 1-5 secs.			

Final.

Harry Martin (Excelsior)	1	H. Prickett (Riley)	3
S. Wright (Excelsior)	2	Time—2 mins. 1 sec.	

TOURIST SECTION.

CLASS C.—Tourist Cars costing £300 or under, which need not carry more than two people.

First Heat.

Name and Car.		Name and Car.	
E. T. Baker (10-h.p. Duryea)	1	G. Burnett (5-h.p. Humber)	0
Time—2 mins. 27 4-5 secs.			

The Humber was stopped through colliding with flag post.

1 min. 43 2-5 secs. (68 miles per hour).	2 mins. 2 2-5 secs. (70 miles per hour).

Contour of Ballybannon Hill.

OPEN EVENTS.

CLASS K.—Scratch race for the Daily Mail Challenge Cup for the fastest car weighing under 1,000 kilos, over the flying kilometre, provided it covers the kilometre in under 40 secs.—90 kilos, or 55·9 miles an hour. The cup to become the property of the member of a club whose car or cars may win it two years in succession.

Name and Car.	Name and Car.
Baron de Forest (70-h.p. Mors) . . 1	E. C. Muir (60-h.p. Mercedes) 0
27 1-5 secs. (83½ miles per hour).	31 2-5 secs. (72½ miles per hour).
Hon. C. S. Rolls (80-h.p. Mors) . . 2	G. Higginbotham (60-h.p. Mercedes) 0
28 secs. (80½ miles per hour).	32 4-5 secs. (70 miles per hour).
L. Rigolly (100-h.p. Gobron-Brillie) 3	H. Austin (50-h.p. Wolseley) 0
28 2-5 secs. (80 miles per hour).	33 3-5 secs. (67½ miles per hour)
J. E. Hutton (60-h.p. Mercedes) 0	A. Callan (45-h.p. Wolseley) 0
28 4-5 secs. (79½ miles per hour).	35 2-5 secs. (64 miles per hour).
De Brou (45-h.p. De Dietrich) . . 0	G. P. Burton (40 h.p. Mercedes) 0
31 2-5 secs. (72½ miles per hour).	37 3-5 secs.

CLASS L.—Scratch Race for the Autocar Challenge Cup.—Motor vehicles of any power or weight. The Cup becomes the property of the owner of the car winning it two years in succession, or three times in all. Over flying kilometre.

Name and Car.	Name and Car.
Baron de Forest (70-h.p. Mors) . . 1	J. E. Hutton (60-h.p. Mercedes) . . 0
26 3-5 secs. (86 miles per hour).	30 secs. (75 miles per hour).
M. Gabriel (80-h.p. Mors) 2	S. F. Edge (40-h.p. Napier) 0
26 4-5 secs. 85½ miles per hour).	30 4-5 secs. (74 miles per hour).
L. Rigolly (100-h.p. Gobron-Brillie) 3	E. C. Muir (60-h.p. Mercedes) 0
27 1-5 secs. (83 3-5 miles per hour).	29 2-5 secs. (77½ miles per hour).
Hon. C. S. Rolls (80-h.p. Mors) . . 0	De Brou (45-h.p. De Dietrich) . . 0
28 secs. (80½ miles per hour).	31 3-5 secs. (70 miles per hour).
	G. P. Burton (40-h.p. Mercedes) . . 0
	38 4-5 secs.

PRIVATE MATCH for £30 Cup, presented by the Club.—Flying kilometre.

Name and Car.	Name and Car.
Hon. C. S. Rolls (80-h.p. Mors) . . 1	J. E. Hutton (60-h.p. Mercedes) . . 0
28 4-5 secs.	

SECOND MATCH.—Flying kilometre.

Name and Car.	Name and Car.
J. E. Hutton (60-h.p. Mercedes) . . 1	Baron de Forest (70-h.p. Mors) . . 0
29 4-5 secs.	

Naturally greatest interest was evoked in the performances of the racing cars. Mr. J. E. Hutton attained seventy-eight miles an hour on his 60-h.p. Mercedes, and the Hon. C. S. Rolls

The Castlewellan Hill Climb, View of Ballybannon Hill.

only one mile an hour less on a 80-h.p. Mors. In the Daily Mail kilometre race, Baron de Forest, the Hon. C. S. Rolls, and Louis Rigolly were first, second, and third—all over eighty miles an hour. Later, Baron de Forest attained a speed of eighty-six miles an hour, and Gabriel of 85½ miles per hour.

THE CASTLEWELLAN HILL-CLIMBING AND SPEED TRIALS.

[BY TELEGRAPH.]

NEWCASTLE, 9 A.M., Tuesday.

MOTORISTS have long been astir, and the capacity of the hotel here has been taxed to the utmost. The early trains from Belfast

The Henry Edmunds Trophy.

are bringing a goodly number of excursionists, but, as most of the enthusiastic Ulster automobilists attended the Gordon Bennett race or the speed trials in Phoenix Park, Dublin, there is not

likely to be so large a gathering as if the County Down events were the sole items of the Irish automobile fortnight. Still, the throng of people is great and the hopes of jarveys are rising.

CASTLEWELLAN, 10 A.M., Tuesday.

An early inspection of the road from the Clough to Castlewellan reveals its difficulties. At Clough begin a series of steep descents until the hill at Ballybannon is reached. It is a hill calculated to stir the nerves of a Gabriel or Jenatzy or a Jarrott. Then with a violent descent the road goes straight to Castlewellan, where stands have been erected in anticipation of the demands of visitors. At the top of Ballybannon Hill is the Automobile Club's enclosure, and there the officials are having a last consultation before the events of the day begin. By way of a change, a thought has been paid to the wants of pressmen, and desks provided for their accommodation near the telephone. Evidently recent strictures have borne fruit, and the Club is recognising that its efforts would be of little avail but for journalists, who, up to the present, have been treated with scant courtesy. Changes of plans have been as violent as changes of weather and as difficult to ascertain until too late as any attempt to interview the Clerk of the Weather Office. The road has just been closed to traffic and all side roads leading to the course have been barred. Already we appreciate the cool shade of the tall trees that gracefully overhang the road and render the Club enclosure a delightful rendezvous. Across the road a frail-looking bridge has been thrown, which promises to be useful during the day. The gradients of Ballybannon Hill, as will be seen from the contour, taken from the Club Journal, are severe, the steepest being 1 in 8.7. This extends a distance of 112 yards, while other notable stretches are 1 in 10, and the top part of the hill 1 in 11. The motor-cycle section is run first, and of twenty-four entries only thirteen appear. The six heats become increasingly monotonous, despite some close finishes. In the final two Ormondes and a Chase compete for supremacy, and the hill is climbed in 41 1-5 secs. by Wright on an Ormonde. Then we have a hill-climbing competition for the Edmunds trophy. Originally it had been intended that the course should be 1,200 yards, but this has been reduced to 600. Campbell Muir proves the winner of the trophy, his Mercedes doing grandly. Rolls guides his Mors into second place, and Werner's Mercedes is credited third. A Duryea opened the exhibition in 62 4-5 secs. Those which have travelled the distance within the minute are the Hon. Scott Montagu and E. M. C. Instone on Daimlers, Hargreaves on a Napier, Brun on Villain, Rawlinson on Darracq, Edge on Napier, Hutton and Higginbotham on Mercedes, Austin on Wolseley, and Rigolly on Gobron-Brillié.

1 P.M.

A long wait is caused by the determination of some competitors not to risk the stiff bend between the two hills, a bend that appears very dangerous. Unfortunately the people of Castlewellan know nothing of the change, and although the finish has been reduced to Ballybannon, making the distance only $2\frac{1}{2}$ miles, the cars are ordered to go ahead after finishing, so as to give the people of the little town a bit of a show. It is, however, a sorry pretence and should have been foreseen.

More motor-cycle heats are being run, interest in the proceedings being revived by the Graphic handicap race. There are several absentees; the road has become very dusty, and every car as it starts away into Castlewellan between the two rows of police leaves a cloud of dust that settles uncomfortably on everything.

3 P.M.

Undoubtedly the greatest interest is taken in the racing section for the prizes presented by the Royal Ulster Yacht Club. It is rumoured that these are being withheld until a meeting of the Committee, but the races are run meanwhile. In class J. there is keen competition. Regret is expressed at the absence of Jarrott, who has returned to England, and of Edge, who is acting as a road steward, while many would like to see the Star racer and Mr. Cordingley's 40-h.p. Mercedes on the course. Unfortunately the latter is detained at Dublin. A cry of "Clear

the course!" is raised, and with a mighty rush Hutton comes along, doing the $2\frac{1}{2}$ miles in 2 mins. 20 3-5 secs. Heralded by a cheer, Stocks finishes in 8 secs. less. Ramois, on the Pipe, covers the course in two seconds under 3 mins., and the two Wolseleys take 2 mins. 48 4-5 secs. and 3 mins. 24 4-5 secs. respectively. Rolls, on his Mors, is almost as speedy as Stocks, and then we anticipate the advance of Campbell Muir. He takes one-fifth of a second more than the Gordon Bennett representative, and is beaten by the last competitor, Rigolly, on his 100-h.p. Gobron Brillie, who only takes 2 min. 5 2-5 secs. Result—Rigolly first, Stocks second, Campbell Muir third.

5 P.M.

The brilliant weather continues, and the scene, with the Mourne Mountains in the background, presents one of the most picturesque motor meets yet held in the United Kingdom. A few tourist cars make a second run for verification of their times, and then the event is over. Save for the sudden shortening of the course, everything has been well done and in order.

BELFAST, 10 P.M.

Comparatively few cars have come in here, the majority of motorists having been allured from the official itinerary by the charms of Rostrevor, while others are lingering at Newcastle, and some have gone back to Dublin, whither all should return to-morrow. Reference to the day's events in Ireland has been almost supplanted by the news of the Government's Bill introduced this afternoon. Agreement is expressed with the intention not to require amateur drivers to be licensed, and also the increasing of the tare weight, this being a matter of importance in view of the transit scheme.

The results of the Castlewellan Motor-Cycle Hill Climb are:—Wright (Ormonde), first, 41 1-5 secs.; Hacking (Ormonde), second; Chase, on Chase machine, third.

In Motor-Cycle Speed Trials, up to 114 pounds, Hacking, first; Wright, second; and Stones, on Rex, third. In class for machines up to 170 pounds, Martin (Excelsior), first; Chase, on a Chase, second; and Wright, on Excelsior, third.

In the Graphic Cup contest, J. W. Cross, on Humber, won in 3 mins. 29 4-5 secs., and was officially declared first; Hon. Scott-Montagu, unofficially second; Instone, unofficially third.

In class for Racing Cars under 650 kilos., Rawlinson, first, on Darracq; Le Brun, second, on Prunel. Only two starters.

Mrs. Edge's car met with a mishap near the Giants' Causeway.

On the highest authority we are requested to contradict the rumour circulated in Ireland that the King of the Belgians has offered £6,000 for the car driven by Jenatzy; Mr. Gray Dinsmore has no present intention of selling the vehicle.

At Kildare much curiosity was expressed one day last week concerning a couple of cars driven by military officers and conveying a large party of nuns for a run across the Curragh.

SEVERAL excellent sets of picture postcards were issued in connection with the Gordon Bennett race, but perhaps one of the most curious was that published by Mr. Tempest, of Dundalk. These were after the style of Mr. E. T. Reed, whose "Prehistoric Peeps" have been studied by the artist. As mementos of an important event they are interesting.

In addition to the London tailor mentioned last week as making displays of motor clothing through Dublin agents, Burberry's deserve recognition. Many of the Irish tailors are adding motor departments and their windows are attracting great crowds.

EDGE drove his new car in Gordon Bennett race against express wish of Mr. Napier. His tyres fitted faultily, and we cannot help thinking he would have made a better show had he kept to the original intention of running his old car and using his new one at Phoenix Park. Mr. Alexander Winton has left for Scotland, his native land. Many motorists will ship their cars at Cork, returning to England via Plymouth and the Devonshire roads.

THE IRISH FORTNIGHT.

WE have received a number of letters from competitors with regard to the speed trials held on Saturday last. Mr. A. Goodwin writes:—"I would like to call your attention to the fact that in Class A motor-cycle section the Ormonde ridden by Mr. C. W. Hacking in heat four made fastest time, viz., 2 min. 2.5 sec. for the one mile plus one kilom. Unfortunately, through some misunderstanding with the officials as to the time of the final heat, Mr. Hacking was not present when the names were called, with the result that the Ormonde which had won the fastest heat did not compete."

MR. A. GOVAN writes:—"I send you an account of my experiences in Class D of the Tourist section. Some little while back I entered for the Tourist racing section, and the only correspondence I received from the Club up to the time of my departure from Glasgow was in the shape of a receipt. I was greatly surprised that up to the evening of the 3rd inst. I had received no communication whatever as to how or what time the races on the following day were to be run. However, I saw by the evening papers that the racing was commencing at 8 a.m., and, on arriving, as there were no programmes, rules, or verbal instructions, I came to the conclusion that after I had won my race I had finished and the race would be decided by time. Judge my surprise at finding on my return that the two fastest cars had to run in a final, and that, as I was not there, Mr. Warren Smith, although unaccustomed to the car, had driven it without any authority from me."

THE HON. C. S. ROLLS asks us to mention that the car he drove in the speed trials was one of last year's Paris-Vienna type.

THE Tourist Information Bureau, 6, Westland Row, Dublin, which was open from 5 a.m. until 11 p.m., during the past week, rendered most valuable assistance to motorists of all nationalities. They arranged for a series of wires from Ballyshannon on the day of the race, and which, on arrival, were read with intense interest by dense crowds as soon as posted in the windows.

THE number of Mercedes cars in Ireland has led to the suggestion that their owners should form a Mercedes Club, membership being restricted to such owners.

THE following are the entries for the hill-climbing handicap at Killorglin, co. Kerry, to be held on the 15th inst.:-

Distance about one mile.

CLASS C.—Tourist cars costing £300 or under, which need not carry more than two people.

Name.	Car.
Alfred Burgess	8-h.p. M.M.C.

CLASS D.—Tourist Cars costing over £300, but not more than £650, to carry four people.

Name.	Car.	Name.	Car.
Sir J. I. Thornycroft.	20-h.p. Thornycroft.	E. Brun	12-h.p. Prunel.
J. T. Overton	24-h.p. Georges Richard.	H. Belcher	12-h.p. Humber.
		Alfred Burgess	10-h.p. M.M.C.
		E. M. C. Instone	12-h.p. Belgica.

CLASS E.—Tourist Cars costing over £650, but not more than £1,000, to carry four people.

Name.	Car.	Name.	Car.
J. W. Cross	20-h.p. Humber.	Willard Evart-	15-h.p. C.G.V.
Hon. John Scott	22-h.p. Daimler	Hall	
Montagn	22-h.p. Daimler	George Iden	20-h.p. M.M.C.
E. Manville	22-h.p. Daimler	Alfred Burgess	20-h.p. M.M.C.
E. M. C. Instone	22-h.p. Daimler	Lawrence Vick-	15-h.p. C.G.V.
F. R. S. Bircham	Special design.	ers	

CLASS F.—Tourist Cars costing over £1,000, to carry four people.

Name.	Car.	Name.	Car.
J. M. Gorham	22-h.p. Daimler	J. Ochs	16-h.p. Napier.
A. MacDonald	22-h.p. Daimler		

CLASS G.—Steam Tourist Cars costing not more than £800, to carry full complement of passengers.

Name.	Car.
J. W. H. Dew.	6-h.p. Gardner-Serpollet.

ON Monday a cow came into the way of the car driven by Mr. J. F. Ochs, of London, and, as Stephenson told the Railway Commission on a famous occasion, the result was "bad for the cow"; but, if hurtful to the cow, it was also awkward for the motorists. The car swerved and began to run down an incline towards a bog. The occupants jumped out ere the vehicle had settled itself comfortably in the bog, and no injury was done, but it was a narrow escape.

OUR representative, telegraphing on Thursday morning, remarks:—Mr. Campbell Muir will drive Edge's boat in the Motor Boat Race at Cork. The luncheon by the Lord Mayor of Belfast to motorists was abandoned owing to difficulty of getting them together. Conversation is becoming animated over the decision of the London and North-Western Railway Company to charge owners 50s. for conveyance of cars from Dublin to Holyhead at owners' risk, and £3 at company's risk. A large contingent stopped at Newry on their way back to the capital, and the people of the ancient town saw more cars on Wednesday than ever before. Parties are being made up for tours in the west, but there is a general feeling that little consideration has been shown motorists by hotel keepers, and not a few have declined to join on that account. Everywhere there is praise at the tolerant attitude of the police. The Kerry Council have issued orders closing the road on the 15th inst.

THERE is great weariness among those who have motored thus far, and but few are showing real interest in the further events; in fact, scores have gone back to England, and the number of starters in the Cork and Kerry events will not be great.

ON Saturday evening a dinner was given at the Shelbourne Hotel, Dublin, in honour of the competitors in the Gordon Bennett race.

THE correspondent of the *Velo* speaks thus of the organisation of the course:—"It must be admitted at once that the organisation was both extraordinary and incomparable—such as has never been seen before. Nothing can give an idea of the precautions taken along the whole 168 kilometres of road converted into a track for one day. The competitors were able to drive the whole distance without seeing on the road—outside the controls—either a human being or an animal."

THOSE motorists who have gone northward will find Mr. T. Rigby's illustrated "Guide to Belfast and the North" valuable. The book is written in a literary style not always associated with such works and without the verbiage that lengthens volumes but wearies the reader. The chapter on "How to see Belfast" is particularly good and will be appreciated by those who wish to see a great deal in a little time. And where is the motorist who does not come within that category?

AN interesting run from Dublin is to Dundalk—a distance of just over fifty miles. The first ten miles of uneven road are rather disappointing as far as Swords, where the round tower is a conspicuous landmark. After Drogheda is passed, the road improves, and it is quite a fine run through Dunleer, where Mr. Bernard Cannon has a stock of petrol, to Dundalk.

MR. M. T. WOODS, of Newbridge, informs us that good accommodation can be obtained for motorists and cars in his town during the tour. It is the nearest large place to Ballyshannon cross-roads, and he has just received a large consignment of Carless and Capel's petrol, as well as spare parts, etc., in view of likely contingencies.

A MEETING in connection with the improvement of means of transit has been held in the Cumber Claudy district of co. Derry. The Mayor of Derry wrote hoping that a good service of motor cars would be established between his city and Cumber. Resolutions were passed approving of the scheme, and appointing a deputation to wait on the District Council to improve the roads as a preliminary step.

CONTINENTAL NOTES.

By "AUTOMAN."

THERE has been nothing else talked about in automobile circles or written about in automobile papers on the Continent except the great Irish race. Indeed, the daily papers have almost without exception had columns of news telegraphed by the special reporters from the scene of action, and every little detail of Irish life, even the comicalities of Irish expression, have found their echo, mutilated and unrecognisable by translation, in the Continental press.

ONE thing is quite certain. The A.C.G.B.I. may be very proud, and very justly proud, of the unstinted praise they have got on the subject of the organisation of the race. According to the Continental press the arrangements and the organisation

to follow more closely what has been done up to date on the Continent! How often has it been thrown back at me that these racing cars in France were freaks and had no stability; and if they were light, were so at the expense of strength. The whole absurdity of these arguments has had a telling proof on the Irish course of the Gordon Bennett race, and once more I repeat that the cars in question are not freak cars, but are ordinary touring vehicles with racing bodies. Every part and parcel of them may be copied next year by those who wish to have powerful and strong automobiles. By this I do not wish it to be understood that I advocate high speeds for touring on the common roads, nor high powers for tourist cars; but the question of what is high power and what is high speed is one which is entirely relative, and which we are not yet in a position to decide. Only four short years ago a 12-h.p. car was regarded as a high-powered vehicle, whilst to-day a 40-h.p. Mercedes is considered a reasonable car.

Rigolly on the 100-h.p. Gobron-Brillie he drove at the Phoenix Park Trials.

[La France Automobile.

have outdone anything that has ever been attempted before on the Continent, where the experience of years in road-racing has enabled organisation to be brought to a fine point. Nothing comparing with the complete and good organisation in the Irish race has ever been seen.

FRENCH automobilists see with chagrin the Cup going across the frontier to their hereditary enemies. But they console themselves very greatly with the fact that all the three French cars completed the course in excellent time, and without the slightest hitch, whilst no other nation's cars could stand the test. The length at which the French very reasonably enlarge on this point is quite excusable, when we remember that for years the cry in England has been that the French cars were only suitable for French roads and high speeds, but would not stand the racket of the English roads. How many times in these notes have I fought against this popular error, and advised English makers

WITH regard to the trade in general it is a good thing that the Gordon Bennett Cup has gone to Germany, and few people will begrudge the success of the Cannstatt firm, especially when it is taken into consideration that the cars they had built for the race have been burnt in the fire which destroyed their factory, and that they have, like plucky sportsmen, come into the field with their ordinary touring car, and won with that. In addition to the fire the difficulties of finding drivers for the Mercedes car has been very great, on account of the action of the German Automobile Club; and in spite of all this they carried the day!

ALREADY speculations are being made as to where the race can be run next year, and it has been taken for granted that the Emperor will show great interest in the race, which is quite probable. Germany is far behindhand in automobilism, and, strange to say, not 5 per cent. of the production of the Cannstatt

Works remains in its country of origin. The Cup race will, it is to be hoped, stir up the sport of motoring, and make a further increase in the trade.

SANTOS-DUMONT, the little Brazilian aeronaut, has certainly the most remarkably good luck. He seems to be able to have all sorts of mishaps in the air without any serious consequences, whilst other aeronauts are hurled to destruction without the slightest warning. Last Sunday, on his little No. 9, he went to visit the Island of Puteaux in the River Seine, close to Paris, where the Tennis Tournament was going on, and in the first place got his guide ropes entangled with the electric wires. A few minutes afterwards the carburettor of his motor got on fire, and, as his motor was behind him, he did not see it for some time. When he did, however, he walked coolly back along the keel and beat out the fire with his Panama hat. He was unable, however, to continue his promenade, and had to have the balloon hauled back to its shed. At the time of the accident he was a hundred feet up in the air, so that, if the balloon had caught fire, there would have been another disaster to record.

THE German Automobile Club, the German Acetylene Society, and the Mid-European Motor-Car Club are jointly organising a competition of acetylene lamps and headlights for motor-cars. Those entering the competition must send one head-light and two lamps, together with drawings and working instructions, to the German Automobile Club, 4A, Sommerstrasse, Berlin, before February 1st next. The lamps will be tested both in the laboratory and on the road. The entrance fee is 10s. for head-lights and 15s. for each pair of lamps. Prizes of £30 and gold and silver medals are offered.

"LA FRANCE AUTOMOBILE" announces an important competition for March, 1904. It intends organising an International Contest of Durability and Consumption, &c., between Paris and Rome, for which our contemporary offers a first sum for prizes of £800 in cash. The route will be from Paris to Rome *via* Dijon, Lyons, Avignon, Marseilles, Nice, Genoa and Florence.

THE Ostend Automobile week, which is being organised by the Automobile Clubs of Antwerp and Flanders, and which commences on Saturday, the 11th inst., promises to be very successful and should be largely attended. The first day is to be devoted to a series of speed trials over ten kilometres for all classes, the second day (Monday, 13th inst.), to the tourist cars over five kilometres, while on Tuesday, there will be a competition in intricate driving at the Wellington Hippodrome, followed by a flower fete along the sea front. On Wednesday there will be a series of mile trials from a standing start; on Thursday the competitors will be required to make the tour Ostend, Nieupoort, Furnes, Ypres, and back to Ostend by Bruges. Friday, the 17th inst., is to be devoted to kilometre trials between Snaeskerke and Ostend. The week will be closed by an exhibition of the competing motor-cycles and cars. The entries include Baron de Caters (Mercedes), Messrs. Hautvast (Pipe), Guders (Pipe), Rigolly (Gobron-Brillié), Augieres (Mors), Baron de Crawhez (Panhard), Baras (Darracq), Jarrott (Napier), Jenatzky (Mercedes), etc.

MR. G. SHRAPNELL SMITH, who has been well known in Liverpool automobile circles, is coming to London, and will locate himself at Cecil Chambers East, Strand, W.C., as a consulting and advisory engineer, paying particular attention to heavy vehicular traffic. He has also accepted a position on the board of the Lancashire Steam Motor Company of Leyland.

MESSRS. SALSURY AND SON, LIMITED, the well-known motor lamp makers have sent us an example of a fine new showcard they have just got out. It is finished in a washable process known as geloleum and depicts a motor-car, the headlights on which are brilliantly lighting up the road. Messrs Salsbury will be glad to send showcards to those motor agents who apply for the same.

MOTOR-CYCLING NEWS.

THE annual Catford Hill Climb took place at Westerham on Saturday last. The classes were divided according to weight, Class 1 being open to motor-bicycles up to and including 125 lbs.; Class 2, up to and including 170 lbs. A gold medal was given for fastest time, and certificates to all who reached the top. Of the fifty-one entrants, thirty-seven started. The course was from a point about 100 yards below the cross road at the bottom of the hill, to just beyond the danger board at the summit, a distance of about 1,200 yards. Some exceedingly fast times were accomplished over the course, which included one gradient of 1 in 6.25. A. J. Randall, on a 2½-h.p. Bat, won both classes. In Class 1 his time was 1 min. 31 sec., and in Class 2 1 min. 35 sec. J. van Hooydonk on a new pattern 3-h.p. Phoenix, was second in Class 1; his time was 1 min. 37 4-5th sec. H. A. Collier was second in Class 2, on his 2½-h.p. Matchless, his time being 1 min. 37 sec.

MR. V. LEWIS, of Adelaide, one of the motor-cycle pioneers in that part of Australia, has recently been doing good work in bringing out the utility of motor-bicycles for rapid work. On the occasion of the Adelaide Cup in May last he offered to provide machines and riders to convey the result of the races from the course, 5½ miles away, to the two newspaper offices. In all, six journeys were made each way in the average time of fifteen minutes for the 5½ miles. The fastest trip was accomplished in 12 minutes, an excellent performance, having regard to the rough and dusty road.

Photo by) The Members of the Liverpool Motor Cycle Club at Ormskirk. (Mr. J. Edge

A CARDIFF doctor, writing to the *Lancet*, remarks that the advantages of motor-cycling as a means of locomotion for professional men are not sufficiently appreciated. During the last few months he has ridden hundreds of miles on a motor-bicycle. "During last March I decided to get a motor-cycle, and, after careful consideration and consultation with some motor-cycling friends, I decided that a 1½-h.p. machine with a 22-in. frame was the most suitable for my work, and I accordingly procured one. I had no difficulty in familiarising myself with the working of this machine, for its construction is simplicity itself. Needless to say there have been some temporary troubles such as occur to all cyclists, but I have had no serious mishap or breakage. In the second week of April I was able to dispense with the services of one horse and in the first week of June with those of a second. I do not care for cycling in wet weather, and I am, therefore, not able to dispense entirely with horseflesh. The machine has given me a great deal of pleasure, and I have been able to get over my work in a much shorter time. My health is also much better, as I am now compelled to take more exercise. These facts are sufficient to indicate that motor-cycling may be not only pleasurable but also profitable to the medical practitioner. The one drawback to motor-cycling is the vibration, but this I have reduced to a minimum in my machine by not inflating tightly my front tyre and by employing a large motor saddle."

THE ARCHBISHOP OF DUBLIN'S FIRST MOTOR RIDE.

HERE was quite a stir in Ireland, and particularly in Dublin, last week, when it was announced that His Grace the Rev. Dr. Walsh, Archbishop of Dublin, had taken his first motor-car trip, and that he had been venturesome enough to go over one circuit of the Gordon Bennett course at a speed which in many places was sixty miles an hour. For a man of his age the incident was not only interesting, but also a testimony to his ability to keep abreast with modern movements.

Last week we published a telegraphic account of the trip, and His Grace was certainly most impressed. Seated in the tonneau with the Archbishop and his private secretary, we were able to observe how keenly he watched every curve of the road and every turn of the car. The ease with which the vehicle was steered, and the marvellous control, were facts which proved impressive, and although the Archbishop frankly confessed he would not have made the trip had he known the speed we intended to travel, he, as candidly, acknowledged how he had enjoyed the run, and that it was not so great an ordeal as he had anticipated it might be. Passing beyond Old Kilcullen, the view of the

we dashed over Mageney Bridge as though the race had already begun. "Quietly, quietly," echoed the chaplain, in fearing tones, as though he had visions of Dublin placards announcing the overthrow of Dr. Walsh. Our friends were so accustomed to driving behind horses that the warning usually applied to quadrupeds flew lightly from their lips on a motor-car. But when all the corners had been negotiated and we swept into the straight road from Athy to Ballyshannon both reverend gentlemen were delighted with their wonderful ride.

And then we drove to Cookstown, where the Archbishop was going, and great was the surprise of the priests awaiting his arrival as they saw him draw up in such a state of dusty dignity. Most hospitable were our hosts and most interested was the Archbishop, whose zest for motoring has thus been whetted, and we fancy that, even at his advanced age, the Rev. Dr. Walsh will become a convert to the automobile, which he rightly recognised as one means of visiting his diocese that would devour space and lengthen his time to a considerable degree.

From the Board of Agriculture comes another sectional map on the scale of two miles to the inch. It relates to the Hastings district and covers an area of country ranging from Pevensey in the south to Tunbridge Wells in the north, and from Lewes on the west to four miles east of Rye on the eastern side.

The Rev. Dr. Walsh, Archbishop of Dublin, on Mr. C. Cordingley's Mercedes Car. The Archbishop is seen on the extreme right in the first picture and on the left in the second one.

landscape was quite novel, the whole countryside being opened out to view without any of the encroachments on the vision associated with ordinary railway locomotion. Beyond Carlow, round the old courthouse of which we rushed in grand style, a great wall of dust was beheld. It surprised His Grace, who, but for the brilliant whiteness of the scene, might have imagined he was entering a London fog. Certainly it was thick and close, and, there being little breeze, the dust stood stationary awhile. Into the substance—for it was tangible and clinging—we rushed. After about a mile with the horns continuously blowing, a motor-car was descried. At first the driver put on all speed and gamely attempted to get away. But his effort failed—for a Mercedes was in pursuit, and we quickly emerged from Dustland to bright open sunshine. The wall was behind, and the lesser vehicle was suffering alone, and with passengers breathing, let us hope, all good wishes to ourselves.

Meanwhile we had become transmogrified. The black clothes of the prelate and his chaplain resembled a miller's suit, and no sombre hues remained to darken the view. Begoggled and bewhited, the Archbishop was enjoying himself.

But when the nasty turns began and the road grew as insidious as a diplomatist, its sinuous course puzzled His Grace and perplexed his chaplain. "Quietly," said the Archbishop as

THE Gateshead Town Council has decided to purchase a motor waggon, at a cost of £480, for the haulage of stones for road-making.

At the summer meeting of the Institution of Mechanical Engineers, to be held in Leeds from the 28th to the 31st inst., Professor Hele-Shaw will read a paper on "A New Form of Friction Clutch."

"GOLDEN RULES FOR MOTISTS" is the name given to a little book, compiled by Captain W. Phayre Ryall and published by Messrs. B. Thompson and Company, Limited, of Frome. The rules consist of useful hints to motorists; they are brief and terse, so that the captain gets a large amount of valuable information into a small compass.

DURING the early part of last week over a hundred motor-cars passed through Shrewsbury on the way to Holyhead. Only one accident in the neighbourhood is reported. A 16-h.p. car belonging to a Norwich gentleman was being driven up the steep gradient known as Wyle Cop, and was stopped at the top in order that inquiries might be made as to the way to an hotel. On restarting the car ran back, and, colliding with a large electric light standard on the edge of the pavement, knocked it down.

HERE AND THERE.

THE Duke of Manchester has a Brush car on order.

TO-DAY the members of the Yorkshire Automobile Club will hold a run to Harrogate.

THE Mobile Motor Engineering Company, Limited, of Birmingham, were last week fined £5 and costs, for storing 13½ lbs. of carbide of calcium without a licence.

MAJOR LANG, of the East Sussex Constabulary, has just acquired a 10-h.p. Wolseley tonneau. The Wolseley Company have also just supplied a 10-h.p. car to the London County Council Fire Committee.

WE have received a copy of No. 7 of the "University of Birmingham Engineering Journal," a well got up and interesting little publication. In the issue before us Mr. Henry Lea M. Inst. C.E., concludes his "Diary of a Motorist."

AN order has been issued by the Chief of Police of Omaha Neb., directing policemen to "stop and arrest all automobilists proceeding faster than the ordinary gait of a horse, or more rapidly than they could stop their machines at short notice."

THE Motor Cycle Trades Association, Limited, has been registered with 250 members, each liable for 5s. in the event of winding up. Object, to encourage, promote, and protect the motor cycle and kindred trades in the United Kingdom or elsewhere.

FROM the office of the New York Secretary of State at Albany it is reported that 4,400 names of automobile users have already been registered in compliance with the provision of the Bailey law. New names are being received at a rate of over 150 a day.

ON Saturday, the 27th ult., H.R.H. the Prince of Wales accompanied Mr. Leopold de Rothschild on the latter's 16-h.p. Napier car to the Agricultural Show at Park Royal. The Earl of Derby was also a passenger on the car, being delighted with the trip.

AT the last meeting of the Liverpool Chamber of Commerce it was reported by the Association of Chambers of Commerce that no satisfactory answer had yet been received from the Government with regard to the tare limit on motor vehicles, and that the matter had accordingly been put into the hands of the Commercial Committee in Parliament.

RAPID progress is being made with the new road now under construction from Songolodo, on the Congo Railway, to Popokabada, on the Kuango. The distance is about 310 miles, and the road, which is to be nine yards wide on the plain and five yards in the mountain, is built especially for traffic by the new motor wagons ordered by the Government. These vehicles will haul loads of two tons over the road at the rate of 20 miles a day.

THE latest addition to the well-known guides published by Messrs. Adam and Charles Black is one entitled "Around London, North Side." It has been edited by Mr. A. R. Hope Moncrieff, and takes in a part-circle roughly drawn from Watford to Epping. The work is divided into four main chapters—to St. Albans, The Great North Road, Enfield and beyond, and Epping Forest—while five maps are provided. The guide is one that can well be recommended to metropolitan motorists.

A SPECIAL meeting of the Norfolk County Council was held at Norwich, on Saturday last, when, during the consideration of the report of the Standing Joint Committee, Mr. Pratt raised the question of the speed of motor-cars, and said it had come to his knowledge that the Chief Constable had given instructions to the police to take the time of motor-cars on lonely and unfrequented roads. He thought the most stringent regulations should be enforced against careless drivers, but it seemed to him the action of the Chief Constable, pending legislation, was vexatious and unwise. The Clerk said in September, 1900, a resolution was passed by the Council to the effect that the Chief Constable was to exercise extreme vigilance in order to secure the conviction of offenders against the motor bye laws,

THE Hydroleum Motor Co., Limited, of Willesden Junction, have established a special department for the repair of heavy steam lorries.

FROM the General Incandescent Arc Light Company, 115, Cannon Street, E.C., comes a handy vest-pocket address book, in which the electrical products of the company are incidentally mentioned.

MR. A. C. HILLS has resigned his position as managing director of the Goodyear Tyre and Rubber Co., and has joined Mr. E. H. Hart as manager of his automobile business. Mr. Hills will retain a seat upon the board of the Goodyear Co.

THE Countess of Jersey gave her third garden party at Osterley-park on Saturday last. There was a very large attendance, the three special trains being crowded, but a great number of the guests drove or travelled in motor-cars from town.

THE Motor-Horse Company, Limited, has been registered with a capital of £100,000 to adopt an agreement with the Centre-Steering Tractive Company, Limited, W. H. Carmont, and W. E. Carmont, and to carry on the business of manufacturers of and dealers in steam, electric, and other engines, motors, etc.

THE accompanying illustration shows the Lobee Rotary Circulating Pump for Water-cooled Motors which has been put on the market by the South British Trading Co., Limited. It gives a positive circulation of the cooling water, can be operated at a high or low rate of speed without affecting the efficiency of the pump, and can be run as high as 1,500 revolutions per

minute. At 100 revolutions it is claimed to be able to circulate one gallon of water per minute. The pump, which is made entirely of bronze, is almost noiseless in action, simple in construction, and can be operated either by sprocket and chain, pulley and belt, or friction pulley. The temperature of the water does not affect its working, as trials have shown that it will pump boiling hot water.

THE latest addition to the list of souvenir guides published under the auspices of the Health Resorts Association is one relating to Aberystwyth. It is beautifully got up, and anyone intending visiting this well-known Welsh seaside resort cannot do better than write for a copy to the town clerk, who will send one free to all applicants by letter or post-card.

A COLONIAL reader of the *Journal* writes from Geelong, Victoria:—"Motoring in this country is only in its infancy, and it is a great novelty to see a car. I regret to say that its usefulness is not appreciated as much as it should, as our Legislators have put a duty of 20 per cent. on all cars imported, and before charging this 20 per cent. 10 per cent. is added to the invoice, making the duty work out at 22 per cent., rather a heavy item."

THE chief constable of Hampshire issued the following notice with reference to the review by the King. "Motor cars.—It is anticipated. there will be heavy traffic on the Farnham and Farnborough road on this occasion. Motor-cars will not be permitted to travel at a greater speed than that of the ordinary vehicular traffic on this road between the following points: Farnborough Railway Bridge and Royal Pavilion Gates, Aldershot. Motorists are requested to assist the police by observing this request."

CORRESPONDENCE.

THE ANTI-MOTOR CRUSADE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The balderdash which has been published recently has, no doubt, emanated from three classes of the community, namely, (1) the antiquated progress haters who recall with envy "the good old times" of the stage coach, when it took two days to accomplish a distance which can now be covered in three or four hours; (2) meddling busybodies, who like to see their names in print; (3) contemptible individuals of a jealous disposition, who would perhaps like to have a motor-car themselves, but, as they see no prospect of ever possessing one, would, if they could, render it illegal for anyone else to enjoy one. Now, Sir, in all probability, not one of these anti-motorists has ever been on a motor-car, and it would be interesting to know the extent of their joint knowledge as to its construction. This is, no doubt, the reason why motorists have treated them with a kind of indulgent pity, and refrained from entering the arena of printed warfare. At the same time, it is as well not to allow these cranks to have matters all their own way, and perhaps, as one who has constantly used a motor-car for four years without having once collided either with a pedestrian or a vehicle, they will forgive me for offering them a little advice by recommending them first to study the object of their invectives; then seek an opportunity of riding in a car, then to reflect what silly asses they have been for braying without a cause! I confidently assert that there is as much (if not more) safety in a motor-car driven by one who thoroughly understands it, as there is in a hansom cab, and recent tests have proved that a motor-car can be stopped in infinitely less time than is required to pull up a horse going at much less speed. The industry is sufficiently hampered without these shrieking ignoramuses trying to still further fetter it. I would remind them of the outcry which was raised against the cycle some fifteen years ago, and would ask them whether any of the surviving writers of indignant letters against that invention—which has done, perhaps, more than any other to circulate money and open up hitherto inaccessible or neglected beauty spots of our country, to say nothing of the employment it has afforded to many thousands—would now like to own the authorship of such twaddle?

It is agreed by all parties that the present law is ridiculously inadequate, and if the law is an ass, some of its minor administrators deserve the appellation with an expressive adjective. It is, indeed, an outrage, and nothing else, that magistrates should be so flagrantly prejudiced. There was a case reported in the papers only last week where a magistrate actually commended a constable for the part the latter had taken in the prosecution of a motor-car owner, before hearing any evidence to show that the prosecution was justified! Needless to say that, whatever the merits or demerits of the case, the poor defendant was heavily fined. No one appreciates more than I do the necessity for caution in busy thoroughfares, but from my office windows I have seen motor-cars which have been travelling down one of the busiest streets of Birmingham at the rate of about twenty miles an hour pass unchallenged, whereas if one keeps within, or slightly exceeds legal limits in a trafficless open stretch of country, many miles from the city, where there can be positively no danger, one is almost sure to be summoned by one of the loafing constables who must, at all hazards, secure "cases" in order to justify their selection for the particular duty of watching motors. This is a fact which needs no comment. Surely there should be a distinction made between city and country, and if it is considered safe for a motor-car to travel through busy city streets at twenty miles an hour, I think you will agree with me that some latitude should be allowed in isolated country districts where traffic is practically unknown. By all means let every precaution be taken in the interests of public safety, either by licence of efficiency or otherwise, and let there be an efficient means of identification. Of one thing I am convinced; in spite of the hysterical shrieks of nincompoops, and in spite of the glaring injustice of antiquated magistrates suffering from old age and nerves, the motor-car has come to stay, and the sooner the law is modified on more common-sense lines, and its administration entrusted only to men of common sense with unbiased minds, the better will it be for the entire community.—Yours truly,

FAIR PLAY.

MOTOR-CAR RACING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With further reference to the Duryea Motor-Carriage Company's letter in your last issue, can they tell me why such firms as Benz, Léon Bollée, Delahaye, Peugeot, who, from the beginning of the motor-car industry, fitted horizontal engines, have now abandoned them in place of vertical ones? I have noted the performance of the Winton cars in the Gordon Bennett Cup race, and although they, perhaps, did not have trouble from engine lubrication, the fact remains—vertical engines won. What continental race has been won by a car fitted with horizontal engines in the last three years?

With reference to motor racing. Through winning the Paris-Vienna race, Renault sold 200 cars! (I have heard this on what I consider good authority.) The actual result of the Paris-Berlin race was the placing of orders with France for motor-cars to the value of £4,320,000. I must certainly agree that to race at eighty miles an hour for a kilometre proves nothing. But a race like the Paris-Vienna, where awful roads were met,

any faulty part in the construction of a car would by all means give trouble under these conditions. Look at the money that has gone into Cannstatt for Mercedes cars. But when did the Mercedes show its superiority? At last year's Nice races. I should like to know how much money will be left in Ireland when the Irish Fortnight is finished?

I quite agree with one part of the Duryea Company's letter, where they say that a silent exhaust was ignored by manufacturers some short time ago. But it is thanks to racing that we have discovered that it is not necessary for a car to "bellow like a bull" to be fast. Take the 60-h.p. Mercedes. This car can be made to resemble a sewing machine when necessary. But the Gordon Bennett Cup has proved (again thanks to racing) that neither America, France, nor, I am sorry to say, England can produce such a reliable, fast, silent, racing car as Germany. And what is the result? All those who failed will try and make better cars for next year, for they have found out the weak points that require careful attention. This is one instance of what the Gordon Bennett Cup has done for the motor industry. Apologising for the length of this letter,—Yours truly,

S. J. C. NIXON.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I think that far too much importance is placed on making racing motor-cars, and the only thing that it has done is to make builders lay down machinery that is only fit for building this class of car, and will be a dead loss unless a demand can be maintained for racers. The motor makers have fallen over themselves in their frantic efforts to outdo each other in producing speedy motor-cars, the total result being that they have wasted thousands of pounds, neglected the main point of putting a car on the market to suit the general user, and done their very best to get all kinds of restrictive laws passed to crush the pastime. I maintain that persons like myself, who are waiting for a good two-seated car, derive but little satisfaction from the statement that makers are building 100-h.p. ostensibly in order to give us a reliable car. I can hardly think that the makers are working so hard on our behalf.—Yours truly,

W. T. W.

REPAIRERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As the motor-car industry is being ruined by people who make a practice of overcharging automobilists for slight repairs, I think it only fair that your readers should have the benefit of my experience at a seaside resort on the South Coast.

A short time ago I was stranded one Sunday with a 8-h.p. car, owing to a slight stoppage between the petrol tank and the carburettor. I garaged it at one of the local cycle repairers, with written instructions that nothing was to be done to the car without an estimate being first submitted to me; but, in spite of this, he sent me in a large claim for all kinds of imaginary repairs. Fortunately I was fairly conversant with the mechanism of the car, and therefore refused to pay his extortionate charges.

Should any of your readers have occasion to leave their cars at the local plumbers, who suddenly develop into "Motor-car Engineers," they should see that they are recommended by the Automobile Club, or, at any rate, be sure that they leave written instructions before an independent witness that no alterations are to be made without a written estimate being first submitted. I enclose herewith my name and address, and should be pleased to give any of your readers more particulars of this experience should they desire it.—Yours truly,

"WEE BIT."

A PLEA FOR THE LIGHT RACING CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As one who has had considerable practical experience with motors for some years, and has followed with great keenness the evolution of the racing car and the performances of various makes, the fact that makers are still striving to build bigger cars with more powerful engines fills me with surprise. People are continually saying to me, "Well, what is the use of building these enormous cars when the light and small cars are nearly as fast?" The triumphs of the 30-h.p. Renault in the Paris-Madrid race and the Darracqs in the Circuit des Ardennes justify this statement, and, with other performances, prove that the 30 or 40 h.p. light cars were nearly as fast, more reliable, and certainly less dangerous. A driver has greater control over a light car than a large one. This is proved by the fact that the fatal accidents which have occurred from time to time both to tourist and racing cars have, in the great majority of cases, been confined to cars of the heavy type. The late Paris-Madrid race is a good example of this.

Again, the heavy car costs the maker £2,000 or more to build, whereas the light car costs probably less than half. It is interesting to note, taking the average pace of all the teams running in the Paris-Madrid race, that although the Mercedes, with twelve heavy cars running, comes first, with an average time to Bordeaux of 7 hrs. 28 min. 58 sec., the Darracq, with eight light cars, comes a good second, the time being 7 hrs. 44 min. 25 sec. Only one Renault ran to Bordeaux, this car accomplishing the second fastest individual time, and although of only 30-h.p. was but 15 min. slower than Gabriel's 80-h.p. Mors, probably the fastest car ever turned out by any firm.—Yours truly,

H. H. BOWDEN.

CLUB NEWS.

THE LEICESTERSHIRE AUTOMOBILE CLUB.

This Club, which has now a strong following both in town and county, had a most successful run from Leicester to Belvoir Castle on Saturday, the 27th ult. The weather was almost as perfect as could be wished for motoring, and nearly a dozen cars took part in the trip. About 2.30 the automobilists began to assemble outside the Bell Hotel, and by three o'clock some half-dozen vehicles were ready to take part in the run. Mr. E. G. Mawbey, the president of the Club, with his wife and family, had taken his car to Belvoir earlier in the afternoon, he having arranged to undertake a much longer journey to Skegness later in the evening. The party from Leicester numbered about 25, and included Colonel Powell, Mr. R. E. Parker, Mr. and Miss Bennett, Mr. and Mrs. Waite, Messrs. S. W. and T. C. Clarke, Mr. W. Dalrymple, Mr. R. Canning, and Mr. A. McAlpin (hon. secretary). About three o'clock the secretary gave the order to start, and a few minutes later all the cars were under way. The route selected for the run afforded a glimpse of some of the prettiest scenery in the Midlands. Mr. H. R. Harding, the treasurer of the Club, and an enthusiastic motorist, joined the party near Syston. The roads here are among the best in the district for motoring, and taking advantage of this fact, the cars sped along at an increased speed, and the passengers were able to enjoy the delight of motoring to the full. A capital view was obtained of the Wreake Valley and the surrounding scenery, the country appearing at its best after the freshening influence of the recent rains. After passing Melton the scenery changed somewhat, and became more picturesque, as the wooded vale of Belvoir, with its stately castle towering above the trees, was approached. After a splendid run of about two and a half hours, the party reached Belvoir, and by this time everyone was ready for a substantial tea, served in a marquee adjoining the Peacock Hotel.

The return journey was begun about seven o'clock, and in the cool of the day proved even more enjoyable than the outward trip. A halt was made at Melton about 8.30, where the hospitality of Colonel Powell, a vice-president of the Club, proved not unwelcome. Leicester was reached about 10 o'clock, the total distance covered being nearly 60 miles. The run was considered the most successful of the season.

REFUSING TO STOP.

At Winsford (Cheshire) last week, Thomas J. Stubbs, salt proprietor, was sued for £5 damages to a horse. Evidence was given that plaintiff's horse was in charge of a trainer, who put up his hand for defendant to stop his motor. Defendant neglected to do this, and the animal reared, plunged, and fell to the ground, injuring itself severely. Judgment was entered for the plaintiff for £5 and costs.

DAVID ALLAN, motor-car driver, Glasgow, was convicted at Jedburgh Sheriff Court last week, of having refused to stop a motor-car when the driver of a horse and trap held up his hand. Sheriff Baillie fined him £10, the alternative punishment being fourteen days' imprisonment. Sheriff Baillie said this was the first case of the kind in the town. One of the most important sections of the Act was that which required drivers of motor-cars to stop when a hand was held up, and whenever any case came before him in which the driver of a motor-car refused to stop, he intended to impose the highest penalty.

In Forfar Sheriff Court last week Alexander French again appeared before Sheriff Lee, in response to a summons for refusing to stop. David Fenton, farmer, stated that on June 9th he was driving in a gig along from Forfar to Kirriemuir. When going up Redford Brae he saw a motor-car coming down the hill from the opposite direction. When about sixty or 100 yards away the horse, which appeared to notice the car first, became restive. There was a dog in the car yelping furiously. He signalled with his hand and also shouted to the driver to stop. His horse went straight across the road, and it was fortunate there was a bank for the vehicle to back into, otherwise something serious would probably have happened. The Sheriff said that it might be a question regarding the circumstances which would justify the driver of a horse holding up his hand by way of signalling. Under the regulations of the road he was apparently not required to put up his hand and demand the driver to stop unless his horse was restive. In the present case it had been proved that Mr. Fenton held up his hand and shouted to stop, and when a person was compelled to back into a bank, that surely proved that the animal was restive. He did not think this was a very serious case, seeing no harm or injury was done. Regarding the noise created by the dog, his Lordship said this was undoubtedly an impediment, and it certainly added to the alarm. He believed the car would often pass sheep, men, and horses in safety if the dog was removed, and accused, he thought, should take the matter into consideration, as it was evident this animal was very unpopular. In conclusion, his Lordship said that he would modify the penalty to a fine of £1, with the alternative of three days in prison, but warned the accused that if in future road regulations were broken he would impose a penalty which would be felt.

MOTOR-BICYCLE FATALITY.

At Monkwearmouth on Wednesday last week Mr. Deputy Coroner A. T. Shepherd held an inquest on the body of J. J. Whickham, twenty-three, who died from the result of a motor-bicycle accident. Harry Welding, manager for the Rudge Whitworth Company, at Vine Place, Sunderland,

said the deceased was employed at their depot, and left at eleven o'clock on Monday, the 29th ult., to go to Washington. He went on his own motor-bicycle. Witness saw him at three o'clock at the hospital, but he was then unconscious, and he died at a quarter to five. He had since seen the motor-bicycle. The front forks were broken at the crown, just where the brazing ceased. The machine was not built by the Rudge Whitworth Company. The deceased, who got the machine himself, was an experienced man with motors, and an expert rider. William Watson deposed that he was near Hylton Castle when he saw the deceased coming along on a motor-bicycle in the opposite direction. The machine broke down, turned right over, and the deceased fell on his head. Witness went to his assistance. A trap was procured, and the man was taken to the Monkwearmouth Hospital. The jury returned a verdict of "Accidental death."

A MECHANICIAN SENT TO PRISON.

At the Clerkenwell Sessions last week Emile Soland, a French mechanic, pleaded "Guilty" to having caused bodily harm to Hugh Richard Evans by wilful neglect and furious driving of a motor-car in Foubert's Place, Regent Street, on May 3rd. It was urged in extenuation that the affair was more of an accident than misconduct, owing to the condition of the traffic, and that the accused's employer had compensated the injured man with £100. His lordship said the case was far different to others he had tried, but he felt bound to order Soland a week's imprisonment in the second division.

THE EDINBURGH MOTOR-CAR FATALITY.

In Edinburgh Sheriff Criminal Court last week, before Sheriff Rutherford and a jury, Alexander Mack was tried on a charge of having, on May 23rd, in Dalry Road, Edinburgh, driven a motor-car against Elizabeth Henderson, and killed her. Accused adhered to his plea of not guilty. After hearing all the evidence his Lordship summed up. The jury, after an absence of eight minutes, returned with a unanimous verdict of not guilty, and wished at the same time to convey their sympathy to the bereaved husband. The accused was accordingly discharged.

POLICE TRAPS.

THE cases at West Hartlepool are a result of a police trap at Greatham Bank.

THERE is a measured quarter mile on the Oxford and London road at Aston Rowant.

A POLICE trap—a measured quarter-mile on the Nettlebed road—has resulted in a batch of furious-driving cases at Henley.

MOTORISTS visiting Ruabon must beware of a police trap, telephonic communication having been established between the police station and Johnstown.

A CORRESPONDENT informs us that there is a police trap on the road between Brockenhurst and Lymington, about two miles from the latter. A measured 440 yards on a straight length of road between the New Inn and Batransley Cross Roads is the spot.

A MEASURED quarter mile has been marked out between Utley and Hawcliffe Wood, one mile north of Keighley on the Skipton road, several motorists being caught on Saturday last. A correspondent informs us that it is advisable to drive slowly both before and after the measured distance, as there is a likelihood of it being moved nearer or further away from Keighley.

FURIOUS DRIVING CASES.

THE case against S. Holmes, Derby, was dismissed owing to contradictory evidence on the part of two policemen. One swore the speed was between twelve and fifteen miles an hour, and the other was equally sure it was not more than four!

A BIG batch of cases was heard at Grantham on Saturday last as a result of a police trap. Those defendants who put in an appearance in answer to the summons were fined £3 and costs, while those who did not appear had to pay £10.

THE Spelthorne justices on Monday dealt with a number of summonses against motorists for driving at excessive speed—at the rate of from twenty-five to thirty-two miles an hour. The penalty imposed in every case, except one, was £7 and costs. The exception was a defendant who did not appear, and who was accordingly fined £10 and costs.

MR. CECIL DREW was fined for furious driving along Kensington Road, at the West London Police Court, last week. A police-constable said that he timed the defendant for one-fifth of a mile, which he covered in 27 secs., making a rate of twenty-five miles an hour. He (witness) waited for a signal given by a constable at the beginning of the course mapped out.—Mr. Plowden: What was the signal?—The Constable: The waving of a handkerchief.

FURIOUS DRIVING CASES.

"	*A. H. Pease, Darlington	—	£10, etc.
"	*F. Rendel, Newcastle	—	£10, etc.

Where no alleged speed is given it is understood to be above the legal limit.

* Motor-Cycle Cases.

ON THE WRONG SIDE.

At the Carlisle police court Michael Walton, a youth, was summoned for neglecting to keep to the proper side of the road when riding a motor-cycle and passing a horse and trap at Kingsmoor at seven o'clock on the night of June 5th. He was also summoned for neglecting to give warning of approach at the same time and place. The Chairman cautioned the defendant, and fined him 10s. and costs for passing the wrong side of the road, and he was ordered to pay the costs in the other case.

PERCY CHAPLIN, undergraduate of Caius College, Cambridge, was summoned at the local police court for driving a motor-car on the wrong side of the road on June 11th. Defendant pleaded not guilty. Police-constable Merry stated that on the afternoon of June 11th he heard a collision at the corner of Jesus Lane and Sidney Street, and on proceeding to the spot found that the defendant's car had driven into a milk cart driven by David Johnson. The milk cart was on the right side of the road, and there should have been plenty of room for the car to pass safely. The defendant was fined £1 and costs.

MESSRS. SAUNDERS, LIMITED, of Cowes, have just completed a 30ft. petrol racing launch, built to the rules of the Marine Motor Association, for Mr. Frank E. Beadle, of London, from the designs of Messrs. Wort and Beadle, of Cowes. The motor, which was supplied by the Motor Manufacturing Company, comprises eight cylinders, capable of developing fifty brake horse power. The vessel has already had a trial spin, when a speed of nineteen knots was attained.

AN interesting function took place on Saturday last, when a very handsome cigar case, silver match box, and illuminated address were presented to Mr. W. M. Letts on his retirement from the Locomobile Company of Great Britain, Limited, in order to enter into partnership with Mr. Charles Jarrott. In the presence of the whole staff and men, the presentation was made on their behalf by Mr. A. W. Robinson, managing director, who in a few well-chosen words expressed the regret that all the employees felt at his severing his connection with the company.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion [communications and contributions] must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

VOL. V.]

LONDON, SATURDAY, JULY 18, 1903.

[No. 228.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

ON June 30th Mr. Oliver Stanton drove the officer commanding Royal Engineers, 4th Army Corps, on duty to Caterham and back. On July 4th, 5th, 6th, 7th, and 9th he was also employed, doing duty in connection with the visit of President Loubet, driving Lord Grenfell, the General Officer commanding 4th Army Corps, Brigadier General Eyre

Crabbe, Chief Staff Officer 4th Army Corps; and Major General Sir W. F. Gatacre, commanding the Eastern District. Lieut-Colonel Mayhew, Captains Crampton and Midgley, and Mr. G. A. Miller were also employed upon the same duty, and in addition, Mr. Miller drove the officer commanding Royal Engineers 4th Army Corps to Caterham on July 7th for inspection duty. It has been stated in several papers that July 6th was the first public appearance of the Motor Volunteer Corps. This is entirely a mistake, as the corps has been doing a large amount of good work during the last three months. It was, however, the first appearance of the corps uniform, which has only just been approved by the War Office. The uniform is both smart and serviceable, consisting of tunic and knickerbocker breeches of field service colour serge, with dark green collar and cuffs, and red piping down the seams of the breeches and round the cuffs of the tunic. The cap is of the staff pattern and of the same colour as the tunic. The badge of the corps consists of a road-wheel intersected by an arrow, and with the motto "Subito" underneath. The buttons are white metal and bear the impress of a crown with M.V.C. over it and the motto underneath.

Municipal Motor-wagons.

At the annual meeting of the Incorporated Association of Municipal and County Engineers, held at Kensington the other week, Mr. T. W. E. Higgins, Borough Surveyor of Chelsea, read an interesting paper on the subject of municipal motor wagons. The author was strongly of opinion that even should the cost of working motor vehicles approximate to that of horse-drawn ones, every local authority responsible for cleansing the streets should encourage their use, both on sanitary and economical grounds. In street cleansing alone a vast army of scavengers are employed merely to gather up the excreta of the horse, and all this expense would be saved if motor-vans and carts were substituted for the horse-drawn vehicles now used for the purposes of the City and Borough Councils within the metropolitan area. In the summer of 1900 Mr. Higgins had two motor vans built, and these have been working satisfactorily ever since. He has also had at work a steam motor-van, which has a frame built to take either a tipping body or water tank (700 gallons). This machine is one which has also proved very useful and economical. The chief advantage of motor vehicles is no doubt the speed at which they can work, and this, Mr. Higgins pointed out, is the reason why they must appear costly when used for street cleansing or dust removal in a small district.

The various municipalities are evidently beginning to realise their advantages, for not only in London, but in the provinces, motor vehicles of various types are now in use. That their number will increase as time goes on there is not the slightest doubt, for, as Mr. Higgins pertinently remarked, "mechanical traction has come to stay. It is completely altering the social habits of the so-called upper classes; all the large business firms are advantageously adopting this means of transport, and municipalities have no cause to lag behind.

Curious Police Action at Holyhead.

UPON his return from Ireland, Mr. R. Moffatt Ford has afforded us some interesting information concerning the police. In driving his Decauville from London to Holyhead he was agreeably surprised to find that no traps had then been laid for motorists. When he re-crossed from Dublin, however, the police had evidently repented of losing so golden an opportunity, and were waiting upon the quay at Holyhead where the cars were unshipped. As each car was landed they took down a written description of its appearance, together with the name and address of the owner, obtaining this information from the travelling label attached to the car. Mr. Ford asked by what right this was done and was informed that it was by direction of the superintendent. He then sought out the station master and lodged a complaint against motorists being annoyed and harassed upon the North Western Co.'s premises, whereupon the police were immediately ordered off by the station-master. In the meantime he had also telegraphed to the secretary of the Automobile Club in Ireland, and since then there has apparently been no further trouble in that direction. But, as Mr. Ford points out, it is by such unnecessary actions as these that the constant friction between motorists and the police is perpetuated. Whilst it is only right that all reckless and inconsiderate drivers should be adequately punished, it is absurd that a few scattered local authorities should assume that all motorists are grossly incompetent and should therefore employ every means to harass and annoy them.

Essex Roads.

MR. P. J. SHELDON, the Chief Surveyor of main roads, states in his annual report to the Essex County Council that of the roads under contracts with urban authorities, the least satisfactory during the year are those maintained by the boroughs of Chelmsford and Maldon. Speaking of the rural roads generally, Mr. Sheldon says they are in good condition, and wherever a district has warranted the substitution of granite for local materials the change has been made so far as financial considerations have permitted. Mr. Sheldon adds that the motor-car provided by the Council in December, 1901, has proved of the greatest possible service and convenience. During the fifteen months ending 31st March last it covered 12,150 miles at a cost for petrol (450 gallons) of £35 0s. 7d.; driver's wages, £65; lubricating oils, etc., £1 7s. 6d.; repairs, etc., £26 16s. 1d.; total for working expenses, £128 4s. 2d.; or at a rate per mile of 2½d.

lation delayed the progress of the electrical trades; legislators should be careful lest they similarly hinder automobilism in this country. That this will develop to great proportions may be safely imagined when the success of the British cars in the recent tour in Ireland is considered. As touring cars these attained remarkable distinction, the way in which they travelled over rough roads and maintained a character for general excellence being really noteworthy. In comparison with the best cars of the world, they did wonderfully well, and one result of that event has been to demonstrate the rapid advance that British makers are making in the manufacture of really reliable cars. It only now requires that the movement should be unhampered by restrictive legislation to reap a profitable reward.

The Question of Appeal.

WITH regard to the Bill itself suggestions are already being made that will secure its condemnation by reasonable people. Already the Government has conceded that all drivers of cars should be required to take out licences, and an amendment to that effect is to be moved by Lord Balfour of Burleigh, while the inclusion of motor-cycles within the purview of the measure will secure the interest of a very large number of people. According to the Bill any constable may apprehend a driver who commits an offence under section 1. of the Act—an arbitrary clause that will require full consideration before securing the endorsement of the Legislature. The Bill provides that where imprisonment is the penalty an appeal may be made; but apparently not otherwise. This seems very unfair. Surely an appeal should be allowable whether the sentence is a fine or imprisonment. The penalties suggested, £20 or £50, are sufficiently drastic to warrant an appeal, for all must recognise that the administrators of the law are not wholly impartial in country districts, and that there is just as much likelihood of men being fined wrongly as imprisoned wrongly. Hence our contention that the right of appeal should be as freely given to the motorist threatened with being fined as with the man who is sentenced to imprisonment.

Administration.

WHERE a summons fails, the expenses allowed to defendant and witnesses should be on the same liberal scale as when fines are made. There should be more equity practised in the matter, and not so much animus shown. On this depends the whole matter, for even bad laws need not be so intolerable if administered by men of sense, intelligence, and fairplay. Unfortunately prejudice, bigotry, and a wrong conception of self-interest have too long been allowed to prevail, and the sensational views of agriculturists and journalists who have given little study to the matter have too freely coloured public opinion. We want impartiality in administration as well as equity in law.

Notification Necessary.

WE would also suggest that Councils which make special provisions with regard to speed in certain areas should be required to give full publicity to such regulations, not merely by local advertisement, but by boldly-displayed announcements at the entrances and exits to such areas. This is important, otherwise motorists passing through strange places may be unwittingly dragged before the courts and unjustly punished.

Equity Wanted.

IN fact, if it could be secured that equity and impartiality were possible to motorists many would abandon their antipathy to numbering. Withdrawing the speed limit and recognising that only driving to the public danger, "having regard to all the circumstances of the case," is to be made the basis of offence, is a wise conclusion to which the Government have come. We hope the administrators will carry out the spirit of the law and consider all the circumstances, not paying undue heed to

the unsupported testimony of the police, or the partial views of interested witnesses.

A Watchful Attitude.

SOME of the details of the proposed measure require amendment, and it will be extremely necessary for motorists in Parliament to watch the new amendments put down by opponents of the automobile movement. These will determine the character of the Bill very materially, and the various provincial clubs should give their views to local M.P.'s without delay. Now is the time for action before the whole scheme of the Bill is really settled.

The Irish Fortnight.

NEXT week we shall conclude our reference to the automobile events that have taken place in the Emerald Isle. These have been very successful in demonstrating the safety and reliability of the modern motor-car. The one or two mishaps that have occurred have been of a very slight nature, and our foreign visitors were delighted with the reception everywhere accorded. Amongst the latest letters received by the A.C.G.B.I. on this point is one from Prince Ratibor, the president of the German Club, who gladly pays tribute to the excellent arrangements and organisation made by the Club, and expressed the hope that it may often be the pleasure of his society to co-operate with the British Club in furthering the automobile sport and the automobile industry. On Wednesday the Hon. C. S. Rolls won the Kerry Cup.

Applications of Electricity to Driving Carriages in Town.

A PAPER on this subject was read by Lieut-Colonel R. E. Crompton, at the recent Engineering Conference at the Institution of Civil Engineers. Dealing first with transmission gear, the author remarked during the very trying winter we have passed through, in which the greasy and hence dangerous condition of the streets was singularly unfavourable for automobile traffic, it was noticeable how few accidents occurred with electrical vehicles from side slip. This is partly due to the fact that it is a comparatively easy matter to apply the driving power to the front wheels, which are also the steering wheels. Electrical vehicles also possess an important advantage over petrol or steam-driven cars, in that it is so easy to apply separate power to each driving wheel, there being no necessity for the complication introduced by the use of differential gear. Up to the present, apparently the majority of electrical vehicles use tooth-gearing, in spite of the fact that chains are undoubtedly easier to lubricate and to maintain in good silent-running condition.

VARIOUS accounts of his accident in the Gordon Bennett race having found their way into the press, Mr. J. W. Stocks has asked us to place the true facts before our readers. From the Castledermot outward control is a two mile stretch of road perfectly straight but with a rough surface, then a rather sharp sweep to the left. He was travelling between seventy and eighty miles an hour, and struck a projection in the road at the time when he should have applied the brakes on his car. This displaced him in his seat, and momentarily delayed the application of the brakes, thus preventing the car slowing down sufficiently for him to take the corner. Seeing an absolutely straight road in front of him, apparently quite clear, he decided to go along it and reverse. When about three yards from the entrance to this road (and too late to even chance the correct one), he saw some wire stretched right across, and as his car struck this, the wire first stretched and then the post to which it was attached at the right hand side of the road came out of the ground. His near side front wheel was held by the wire, the car turned round, the off side front wheel broke with the strain, the off side back wheel caught the grass on the left of the road, and he was dropped lightly into the hedge. Fortunately he did not sustain a bruise of any description, neither did his mechanician.

THE CASTLEWELLAN HILL-CLIMBING TRIALS.

ON Thursday, the 9th inst., the invasion of the South began, the routes suggested by the Club being by way of Carlow and other places familiar to those who had gone over the Gordon Bennett course. A few went by way of Wicklow dikes—a route that presented ever varied and beautiful scenery. This way might well have been suggested as an alternative to the somewhat barren beginning of the routes recommended by the organisers of the trials. But at Enniscorthy we learned that the prejudice shown a few years ago by the local authorities against motor-cars still rankled in the breasts of some of the Dublin automobilists, who were credited with having been responsible for the cool reception bestowed to this magnificent road.

The roads of county Cork are abominable. No other word adequately expresses their condition, and it was currently reported that six cars turned back at Fermoy rather than run the risks entailed by the continuance of the journey to the southern town. One car that travelled on Friday morning from Dungarvan to Cork had four punctures, and although the heat of the day may have had something to do with the difficulties, the roads must be held mainly responsible for such a dilatory condition of things. In the city of Cork the welcome

of the citizens was hearty and spontaneous, although in private conversation regrets were expressed that so few of the motorists had travelled down south. Even as it was, all seemed anxious to get to the end of the Fortnight, and on Saturday there was a general exodus, the officials doing all they could to persuade owners of tourist as well as racing cars to go to Kerry in completion of the arrangements. Only a few motorists waited to see the motor beat races, which, as will be seen from the report further on, proved a very tame proceeding.

THE SPEED TRIALS AT CORK.

Friday, when the speed trials were held at Cork, was an ideal day for such an exhibition, and, although the weather was scorching at times, no inconvenience was felt by the spectators on that account, for the Carrigrohane road, where the trials were held, is delightfully situated, with tall trees casting their shadows over the course. It is outside the western boundary of Cork, a portion of the route selected running by the side of the Cork and Muskerry Light Railway, the telephone wires of which were tapped during a portion of the day, in order to complete the telephonic arrangements in connection with the trials.

High banks were on each side of the road, and behind these, spectators had a practically uninterrupted view of the cars over the whole of the two miles, and had the satisfaction of being far away from any danger. The road had been specially prepared, and everyone seemed perfectly satisfied with the arrangements made. So far as the people of Cork were concerned, they showed even more interest than had those of Dublin or Castlewellan, and thousands turned out to see the events. The touring section proved tedious to most, and it was not till the racing cars came along that the spectators showed an enthusiasm greater than any witnessed during the whole of the tour.

In the tourist section, twelve out of the thirty-five entrants started, and the silver cup, presented by the Lord Mayor of Cork and the Executive of the Exhibition, was won by the 6-h.p. Gardner-Serpollet, which accomplished the distance in 2 mins. 7 4-5 secs. The 20-h.p. M.M.C., driven by Mr. G. Iden, accomplished the journey in 2 mins. 35 1-2 secs., and gained the silver medal offered as second prize. A sporting match was decided between the Hon. J. Scott Montagu, driving a 22-h.p. light Daimler, and the Hon. C. S. Rolls, who drove a 20 h.p. Panhard; the former covering the course in 2 mins 55 2-5 secs. There were two classes in the racing section, cups being given by the Exhibition authorities and the "Cork Constitution." In the class for cars weighing less than 650 kilos, E. Brun, on a Prunel, went over alone. In the class for cars weighing not more than 1,000 kilos, there were four starters, who developed a high rate of speed, the cup going to the Hon. C. S. Rolls, who drove his 80-h.p. Mors over two miles in 1 mins. 49 3-5 secs.

TOURIST SECTION.

H. Du Cros's (jun.) 12-h.p. Light Ariel. Handicap, 45 secs., driven by owner. Net time, 2 mins. 58 2-5 secs.

R. W. Leader's 16-h.p. Century. Handicap, 50 secs. Driven by owner. Net time, 2 mins. 53 2-5 secs.

J. Lisle's 10-h.p. Light Star. Handicap, 66 secs. Driven by owner. Net time, 2 mins. 57 secs.

J. W. Cross's 20-h.p. Humber. Handicap, 5 secs. Driven by owner. Net time, 2 mins. 48 3-5 secs.

The Hon. J. Scott Montagu's 22-h.p. Light Daimler. Handicap, 8 secs. Driven by owner. Net time, 2 mins. 51 2-5 secs.

E. M. C. Instone's 22-h.p. Light Daimler. Handicap, 15 secs. Driven by owner. Net time, 3 mins. 19 1-5 secs.

F. R. S. Bircham's "Dennis," special design. Handicap, 5 secs. Driven by owner. Net time, 4 mins. 7 secs.

George Iden's 20-h.p. M.M.C. Handicap, 25 secs. Driven by owner. Net time, 2 mins. 48 1-5 secs.

Alfred Burgess's 20-h.p. M.M.C. Handicap, 25 secs. Driven by owner. Net time, 2 mins. 54 1-5 secs.

A. J. Macdonald's 22-h.p. Daimler. Handicap, 9 secs. Driven by P. G. Garrard. Net time, 3 mins. 4 secs.

The Hon. C. S. Rolls' 20-h.p. Panhard. Handicap, 2 secs. Driven by C. W. Hacking. Net time, 3 mins. 20 2-5 secs.

J. W. H. Dew's 6-h.p. Gardner-Serpollet. Handicap, 50 secs. Driven by W. J. Warren. Net time, 2 mins. 2 3-5 secs.

J. H. Gorham's 22-h.p. Daimler. Driven by owner. Net time, 3 mins. 15 secs.

FINALS.

The following qualified for the finals in the different sections :—
Class D—Tourist Cars costing over £300, but not more than £650, and carrying four people—R. W. Leader's 16-h.p. Century; handicap, 50 secs.; driven by owner. Net time, 2 mins. 53 2-5 secs.

Class E—Tourist Cars costing £650, but not more than £1,000—George Iden's 26-h.p. M.M.C.; handicap, 25 secs.; driven by owner. Net time, 2 mins. 48 1-5 secs.

Class F—Tourist Cars costing over £1,000, to carry four people—A. J. Macdonald's 22-h.p. Daimler; handicap, 8 secs.; driven by P. G. Garrard. Net time, 3 mins. 4 secs.

Section G—Steam tourist cars costing not more than £800, to carry full complement of passengers—J. W. H. Dew's 6-h.p. Gardner-Serpollet; handicap, 60 secs.; driven by W. J. Warren. Net time, 2 mins. 2 2-5 secs.

RESULT.

J. W. H. Dew's car; time, 2 mins. 7 4-5 secs., 1.

George Iden's car; time, 2 mins. 35 1-5 secs.

R. W. Leader's car; time, 2 mins. 59 2-5 secs.

A. J. Macdonald's car; time, 3 mins. 1 1-5 secs.

RACING SECTION.

Class H.—Racing cars weighing less than 650 kilos. Distance about two miles. Prizes—1st, Silver Cup presented by the Lord Mayor of Cork and the Executive Committee of the Greater Cork International Exhibition; 2nd, Silver Medal.

E. Brun's Prunel—driven by owner. Raced over in 2 mins. 49 2-5 secs.

Class J.—Racing Cars weighing not more than 1,000 kilos. Prize Cup, presented by the Proprietors of the "Cork Constitution."

80-h.p. Mors. Driver and entrant, the Hon. C. S. Rolls. 1 min. 49 3-5 secs. ... 1

60-h.p. Mercedes. Driver and entrant, J. E. Hutton. 1 min. 52 4-5 secs. ... 2

50-h.p. Wol-eley. Driver, H. Austin; entrant, Lieut. Mansfield Cumming. 2 mins. 0 4-5 secs. 3

60-h.p. Mercedes. Driver and entrant, G. Higginbotham. 2 mins. 6 2-5 secs.

With reference to Mr. Instone's time we may mention that although his car had been going extremely well in the tour, only three cylinders were working in the race, short-circuiting taking place in the fourth.

Later in the Exhibition the prizes were distributed by the Lord Mayor of Cork, who extended a hearty welcome to the motorists. The Hon. J. Scott Montagu, the Hon. C. S. Rolls, and others, also spoke, the latter being greeted with cheers for Wales.

MOTOR-BOAT RACES.

The starting-point of the motor boat-race was from the Clubhouse of the Royal Cork Yacht Club at Queenstown to the bandhouse on the Marina at Cork. At all the points of vantage on the way crowds of spectators gathered, and their patience was really remarkable. Not only was the weather dull, but the sport was tedious, although some of the manoeuvring at the start and finish of the various events revived interest in the affair to those in the neighbourhood of those points.

The distance of the course was eight and a half miles. Its beauties have often been described in connection with yachting matters.

The ineligibility of the boat with the Mercedes motor for the race, owing to the hull being of French manufacture, robbed the event of its international character. For the Harmsworth Cup there was a heat, a bye, and a final. In the first heat Mr. Edge's 40ft. launch, fitted with a 75-h.p. Napier

engine, covered the course in 24 minutes 44 seconds. This was on a flood tide, but on the ebb tide in the final it took 26 minutes 6 seconds, and beat Mr. J. E. Thornycroft's 30-foot launch with a 20-h.p. engine by 5 minutes 8 3-5 seconds, so that when, in the subsequent race over the same course for the "Yachtsman's" Cup, a handicap, the Napier had to allow the Thornycroft 11 minutes 50 seconds, it seemed, bar accident, a certainty that the last named would be victorious, and this the result proved, Mr. Campbell Muir, who piloted Mr. Edge's boat, only being able to reduce the handicap by 5 minutes 8 seconds, or almost exactly what he won the Harmsworth Cup by.

The Graphic Trophy for the Tourist Car Competition at Castlewellan. Won by Mr. J. W. Cross on a 20-h.p. Humber.

The details were as follows:—

FIRST HEAT.

Mr. S. F. Edge's launch, time 24 minutes 44 seconds, beat
Mr. F. Beadle's launch, length 30 feet, 50-h.p., 8 cylinder M.M.C.
engine. Time, 27 minutes 44 2-5 seconds.
Won by 3 minutes 0 2-5 seconds.

THE BYE.

Mr. J. E. Thornycroft's launch, length 30 feet, 20-h.p. engine, went
over the course for the bye in 30 minutes 28 4-5 seconds.

FINAL HEAT.

Mr. S. F. Edge's launch, time 26 minutes 6 seconds, beat
Mr. J. E. Thornycroft's launch, time 31 minutes 14 3-5 seconds.
Won by 5 minutes 8 3-5 seconds.
"Yachtsman's" Cup, handicap, same course and distance as for
Harmaworth Cup.
Mr. J. E. Thornycroft's launch, length 30 feet, 20-h.p., allowed 11
minutes 50 seconds. Time, 33 minutes 51 1-5 seconds ... 1
Mr. F. Beadle's launch, length 30 feet, 50-h.p., 3 cylinders, M.M.C.
engine, allowed 6 minutes 55 seconds. Time, 33 minutes 12 3-5
seconds ... 2
Mr. S. F. Edge's launch, length 40 feet, 75-h.p. Napier engine,
scratch. Time, 27 minutes 9 1-5 seconds ... 3
First beat second by 3 minutes 16 2-5 seconds, and first beat third
by 5 minutes 8 seconds.

Participants in the tour reached Killarney, the final
stage of the expedition, on Tuesday, a large number passing
through the famous Gap of Dunloe, where there was only one

IRISH GOSSIP.

SOME idea of the demoralisation of the country people that
has resulted from the reports of exorbitant charges at hotels
was given us at Ballyshannon by the representative of a leading
Dublin photographer. He wanted to have a dark room in a small
cottage opposite the start of the race. It was only desired to
change a few plates therein, a fact duly explained to the occu-
pant. She, however, wanted the firm to "make an offer," and
when they declined thought she would be satisfied with three
pounds for the accommodation. When it was pointed out that the
room would only be required for a few minutes, a quarter of an
hour at the outside, she remarked that "that would not matter.
Whether ye were there half an hour or all th' day I should have
to be out of the room meanwhile"—a rendering which made it
clear the payment was intended as compensation for "moral
and intellectual damage" rather than for services rendered.

In their eagerness to secure a relic of Jarrott's wrecked
car, some of the motoring enthusiasts who visited the scene of
the accident are reported to have appropriated, unwittingly, no
doubt, some of the parts more valuable than a broken wheel-
spoke or a splinter of the dashboard.

MESSRS. A. W. GAMAGE, LIMITED, write:—"We notice in

—Lining up for the Trials at Cork.—At the Head of the Procession is Mr. J. W. Cross on the 20-h.p. Humber on which he won the Touring Class Events at Phoenix Park and Castlewella.

(Lafayette, Dublin.

breakdown, the axle of a car giving way, and rendering it neces-
sary to draw the vehicle into Killarney by means of a pony. Stray
cows and donkeys caused some inconvenience along the country
roads of Kerry, as they have done elsewhere in the south.

THE KERRY TRIALS.

On Wednesday the concluding trials of the tour were held
on the old direct road from Killarney to Tralee, starting from
Molaliffe. The hill was a perfectly straight one, and therefore
regarded as safe. The gradient was very severe and tested to the
utmost the hill-climbing capabilities of the cars. The events
comprised five classes—for cars costing under £300, cars between
£300 and £650, cars between £650 and £1,000, cars over £1,000,
and lastly, for steam cars costing under £800. The Kerry
County Council gave a thirty guinea silver cup, which attracted
considerable attention when on view last week in Messrs.
Switzer's windows in Grafton Street, Dublin.

FOLLOWING the speed trials and hill-climbing trials at
Castlewella was a kind of "go-as-you-please" return to Dublin,
where the horns of the motor-cars made merry music on Wednes-
day week. By way of Rostrevor, Newry, and Dundalk went the
bulk of the cars, while a few of the higher-powered vehicles
journeyed northward to the Giants' Causeway.

your issue of the 11th inst. a letter from Mr. Goodwin re the
speed trials for motor-cycles in Phoenix Park, in which he
endeavours to explain away his failure to win the cup. We beg
to say that as far as we are concerned, having won this cup, we
are quite willing to give Mr. Goodwin any satisfaction which he
may desire in the shape of a sporting match. We ourselves do
not like to complain, and should not have done so if other people
had not started, but we now feel that we must mention that at
Castlewella on the 7th inst. our rider was prevented from
starting owing to his machine not being fitted with a brake."

WITH reference to the Napiers in the Gordon Bennett race
Mr. S. F. Edge writes:—"We ran two cars of 35-h.p. with Jarrott
and Stocks driving, and one of 45-h.p. which I drove myself,
because we considered this was the best way of trying to keep
the Cup in this country. Unfortunately, accidents knocked out
Messrs. Jarrott and Stocks, and so far as my own car was con-
cerned, two minutes was the outside time I lost through
mechanical troubles, and the whole of the time I lost was
through tyres. The car, although a new one, gave absolutely
no trouble, and Mr. Napier would not have handed it over to
me saying it was in a fit state to drive unless he was absolutely
satisfied that it was."

D

THE CONTINENTAL TYRE COMPANY are naturally well pleased at the success of Jenatzky in the Gordon Bennett race, seeing that his car was fitted with their tyres. Great preparations were made on the course by the Continental Company to look after tyres on the racing cars. Fifteen experts were brought over and located in four different depots at various parts of the course. Each depot was supplied with spare tyres, tubes, repairing outfits, and bottles of compressed air, the latter to expedite the operation of inflation.

COLONEL NEVILLE CHAMBERLAIN, C.B., Inspector-General of the Royal Irish Constabulary, has issued a circular thanking the members of the force for their intelligence and good conduct on the occasion of the Gordon Bennett motor race. Colonel Chamberlain has received the following message from the Lord Lieutenant:—"Sir, I am directed by the Lord Lieutenant to convey to you the expression of his Excellency's complete satisfaction with the police arrangements in connexion with the late motor-car race. His Excellency was much impressed with the admirable conduct of both officers and men throughout a very trying day, and he desires to congratulate you on the successful result of your labours.—I am, Sir, your obedient servant, A. P. MACDONNELL." The Inspector-General has also received the following message from the Chief Secretary for Ireland:—"Please accept for yourself and convey to the force my warm

the officials of the concern. In the evening, the film, which had not been developed, was securely packed in a tin light-tight box and parcelled in strong wrappers and despatched to London by post. A few days afterwards the twine and labels were delivered at the works in London, and two days subsequently the box of film was delivered at Dublin. On examination it was found that the box had been tampered with in such a manner that the entire spool of film was completely destroyed by the action of light. Thus the only cinematograph record of the speed trials has been completely destroyed. A regrettable circumstance indeed.

QUITE five hundred cars must have been taken to Ireland for participation in the recent tour. We had official intimation of four hundred and twenty being landed at Dublin, while a few were also received at various other ports. At Messrs. Hutton's and the Earlsfort garage nearly one half of the automobiles visiting the country were accommodated and the rest of the number disposed of in the various livery stables and garages throughout the capital.

THE clocks used in connection with the Gordon Bennett race have become interesting mementoes of a historical occasion, and many motorists have inquired as to whether they are obtainable for private use. We understand a few still remain with the makers, Messrs. S. Smith and Sons, of the Strand, W.C., who

Photo by

The Speed Trials at Cork.—E. Brun on the 20-h.p. Prunel, the winner of the Light Racing Car Section.

[Lafayette, Dublin.

congratulations on the splendid way in which the R.I.C. discharged the difficult task of protecting the public during the motor race."

THE Wolseley Company write us pointing out that the Wolseley car driven in class "D," by Mr. A. E. Crowdy, in the Phoenix Park Trials in 2 min. 53 3-5 sec., was a standard 10-h.p. Tonneau, which took the place of the 24-h.p. at the last minute.

THE directors of the Tourist Development (Ireland) Limited, have established a petrol station and also a repairing pit for motorists at the Lakeside Hotel, Killaloe. This is one of the results of the Automobile Fortnight.

ON Saturday morning the steamer arriving at Derry landed at the jetty three motor-vehicles for the Earl of Leitrim. Two of these are omnibuses, and the third a long van or wagonette. In the afternoon they were manoeuvred in the presence of a large number of citizens, to the admiration of the onlookers. Later they proceeded to Strabane, and have now entered upon their work as public-service vehicles in county Donegal.

THE sole right to take a series of cinematograph pictures of the automobile speed trials in the Phoenix Park, Dublin, was secured by the directorate of the Empire Theatre, with the result that three series of pictures were taken during the day by

will be pleased to hear from readers desirous of possessing such a souvenir of the great event.

ON Friday evening, after the races, great crowds collected on St. Patrick's Bridge, and at the bottom of King Street, Cork, it having been rumoured that some of the cars would attempt the ascent of Patrick's Hill. This is really a continuation of the road from St. Patrick's Bridge, and extends nearly a quarter of a mile, the gradient averaging 1 in 6. A short distance from the top, however, the gradient is 1 in 4, and there people were massed in considerable force, in the hopes of seeing a really unique performance. They were not disappointed, for the 50-h.p. Wolseley, with Mr. Austin aboard, went up on second speed in really good style. Those cars of lesser power, and consequently lesser venturesomeness, received rather a scoffing welcome from the people as they turned from King Street over the Bridge, instead of following the Wolseley up the hill, which is the stiffest we have yet encountered in the Emerald Isle.

It was unfortunate that the tour was so long prolonged after the great race. The people had expected to see Jenatzky, Gabriel, and others of the leading competitors, and their absence robbed the tour of much of its interest for the Irishmen of the south.

THE SCHIELE SPARKING PLUG PROTECTOR.

WITH the view of preserving sparking plugs from injury due to jolting of the car over rough roads, or from short-circuiting by reason of wet or mud, a lady inventor—Miss J. Schiele—has lately devised the protector illustrated herewith. Early in 1901 she patented a device which comprised a protective metal casing rigidly connected with the metal body of the plug and carrying an insulating portion, to which a clamp was fixed, the conducting wire being fastened on the latter. In this arrangement no attention was paid to the effects resulting from the expansion of the materials, which is a very important point, the more so as, in consequence of the presence of the protective casing, the body of the plug is no longer in im-

mediate contact with the outer air. In order to remove these inconveniences, and also to give the protection device a more convenient construction, and at the same time assure a perfect contact between the intermediate clamp and that of the plug, the device has been improved. As now made neither the effects resulting from the expansion of the plug and protector or those from the vibrations of the motor or vehicle can exercise an injurious influence on the insulating piece or its connection with the apparatus, or break the electric contact between the intermediate clamp and the plug. Referring to the illustrations, *b* is the metal mounting of the ordinary plug, and *a* the porcelain. By means of the binding screw *i* a spring metal cap *h* provided with a slot is fixed on the plug. An insulating piece *g*, made of porcelain or fibre, having the form of a plate or ring, is adapted

to slide up and down on four uprights *e* screwed into a ring or plate *c* provided with projections *m*. Spiral springs *f* surrounding the four uprights and acting by tension are fixed at one end to the plate *g* and at the other to the ring *c* as shown. The insulating piece carries in the centre the intermediate clamp *l*, on which the wire from the coil is fastened, the clamp terminating below in a plate *k* on which the spring cap *h* bears. On the plug is fixed a protective casing of wire gauze *n* reaching downwards to the ring *c*. The movable insulating plate *g* held between the springs, which act in opposite directions, is completely protected against the effects of vibration of the motor and vehicle, and maintains a continual and perfect contact between the plate *k* and cap *h*; while by reason of its mobility it does not undergo any injurious effect through the variation and expansion of the plug and supports. The device is marketed by M. Leopold Laheyne, of 2, Rue Ernest Allard, Brussels.

WOOD TYRES FOR HEAVY MOTOR VEHICLES.

IT appears that a number of heavy motor-vehicle manufacturers on the Continent are experimenting with wood tyres. Below are given some particulars of a wheel, with a tyre shod with wood blocks, employed on the Scotte steam tractors. The wheel itself (Figs. 1 and 2) is of ordinary construction, with wood

Figs. 1 and 2.

spokes, wood felloes, and steel tyres. To these steel tyres on the outside are applied hard-wood blocks, held between two steel discs on the sides, being dovetailed between them as it were. In order to increase the life of these blocks they are drilled full of radial holes, into which steel studs are inserted. The blocks are entirely independent of the wheels, and can easily be renewed when worn out, i.e., every 3,000 to 4,000 miles run, according to the kind of road-pairing travelled on. The Scotte Company have used these tyres for several years on their heavy tractors, and claim to have found them entirely satisfactory, especially on account of their preventing both skidding and slipping of the wheels.

Figs. 3 and 4

Figs. 3 and 4 illustrate a construction of wood tyre employed on the wheels of a Peugeot heavy motor-wagon, recently exhibited in Copenhagen. The felloe consists of a large number of wood blocks, the grain of which runs radially. These blocks are held in place by two flat steel rings bolted to each of them. The advantages claimed for this form of tyre are the following:—Greater elasticity than iron tyres; less wear than rubber and wood with grain running in a circumferential direction; greatest adhesion to the road surface and an easy renewal of the blocks.

STEAM WAGONS FOR SOUTH AFRICA.

THE accompanying illustration shows one of six Colonial type steam wagons the Lancashire Steam Motor Company are building for South Africa. The vehicle is capable of taking a load of seven tons on English roads having gradients of not more than one in nine. The engine is of an improved link reversing type, specially designed with a view of accessibility. The boiler is of the central-fired fire-tube type, arranged for dealing with dirty water. With an engine speed of 55 revolutions per minute the speed of the wagon is two and five miles per hour. The Lancashire Company's cushion drive is fitted, which admits of the engine making almost a revolution before starting the wagon. A fly-wheel of massive proportions is fitted on the opposite side of the wagon. The compensating gear can be readily locked, and an arrangement is fitted for admitting "live" steam to both cylinders with independent exhaust. The driving wheels are 4 feet diameter with 12in. face. The steering wheels are 3ft. 6in. diameter with 8in. face. A new pattern of expanding brakes is fitted to the inside of the chain rings. The steer-

ing gear is enclosed in an oil-tight casing. The total length of the machine is 18ft. 6in.

THE Town Council of King's Lynn is considering the question of adopting a motor dust and water cart.

MOTORISTS will be glad to learn that the London County Council has just issued a regulation making it an offence to throw glass bottles, nails, or other sharp substances, on the roads.

IN driving between Ely and King's Lynn the other Sunday evening, Mr. Frank Morriss, the well-known Norfolk automobilist, was the subject of a cowardly assault from a labourer, at Southery, who, without the slightest warning, hurled a large and heavy stick at Mr. Morriss and the occupants of his car when passing, and immediately made off. The missile struck Mr. Morriss on the back and narrowly missed Mrs. Morriss, who was sitting in the rear portion of the car. Mr. Morriss at once stopped the car, turned back, and gave chase to the vagabond, and secured him after a short run; he refused to give his name and address, or offer any explanation of his conduct. Mr. Morriss, however, retained his hold until assistance arrived in the shape of someone able to identify the man. After obtaining this information, Mr. Morriss drove away and acquainted the superintendent of police in the district subsequently applying to the Downham Market magistrates for a summons against the offender, which was readily granted.

CONTINENTAL NOTES.

By "AUTOMAN."

ONE of the most stylish and exclusive clubs in Paris is the "Polo Club" at Bagatelle, where the *élite* disport themselves in the season. This year fashion has decided that the automobile gymkhana is one of the most high-class sports, and it is at the Polo Club that such an event has been held. There were several interesting and highly amusing events, including a competition for skill in driving, in which the competitors had each to go back and forwards between four posts, joined together by four wires, breaking two wires, one in the forward movement and the other in the backward movement, and not touching the other two wires. Another competition consisted of a hunt after wild animals, which were suspended to the trees, and on each animal was hung a ring. Each competitor was accompanied by a lady, who with a lance had to spear the animal and capture the ring. A third competition consisted in a race over obstacles, whilst a lady passenger carried in her left hand a glass full of water, out of which not a drop had to

be spilt. A fourth competition consisted in running on to a see-saw, and the winner was the driver who could stay the longest amount of time on the see-saw. A fifth competition, pig-sticking, where an object representing a pig was drawn behind a car, was given up on account of the difficulties and dangers that it might entrain. Amongst the competitors were viscounts and barons, princes, and even a princess, the Princess Murat. The event was most successful, and will, no doubt, be looked forward to as one of the things of the year.

I HAVE told the tale of the origin of the name of Mercedes several times in these columns; but still I think it will not be out of place to make a short mention of it again. The cars turned out of late years by the Cannstatt-Daimler works have been called Mercedes cars from the Christian name of the daughter of Mr. Jellinek, who is the author of the improved type of car. I say advisedly "author," because Mr. Jellinek does not claim to be the inventor of these cars, but he is the director of the Cannstatt works, through whose initiative this total transformation in the models was made, and it is entirely due to him that the German firm take the stand in the automobile world that they do to-day. The name of Mercedes is of Spanish origin and means "Wednesday," and now, by special consent of the Emperor of Germany, Mr. Jellinek, who is president of the board of directors of the Cannstatt-Daimler Company, has added the name of Mercedes to his own, and becomes Mr. Jellinek-Mercedes.

It is said that Jenatzy has won 200,000 frs. at least by capturing the Cup. The Continental Tyre Company gave him 25,000 frs. and the Cannstatt-Daimler Company arranged to give him three cars should he win, and now it is said they are so delighted that they have given him a fourth. The Germans had very little hopes of winning the Cup. So many difficulties had been placed in their way by the German Automobile Club; for, had it not been for the long dispute on the question of the drivers, the 90-horse cars might have been in Ireland at the time of the fire, or at any rate some of them. It is an open secret that the 60-horse cars were found to be overweight early in the year, and that great efforts had to be made to get them in the 1,000 kilo limit. It resulted in the front axle being re-made entirely of a different steel, which steel being lighter in weight, was found stronger than the original steel employed. This obligation of reducing the weight has, says Mr. Jellinek, put the Daimler firm in a position of having found a much more suitable material, and this they will employ largely in their next year's cars, to the great advantage of the customers.

THE Motor-car Bill has been much discussed in the Continental automobile press. The "Auto" devotes a whole column to Lord Balfour, whom it confuses with the Premier, Mr. Arthur Balfour, and states what a fortunate thing it is that the Bill

A Road Scene in Spain.

should have been brought into the House of Lords (sic!) by the Premier, who is himself an enthusiastic automobilist.

THE Ostend week began last Sunday under a most auspicious sky, and the first event was a 10 kilometre race on the new road which the King of the Belgians has had built. This road is quite flat, alongside a canal without locks, and has only two slight bends. It is of macadam with a perfect surface. There were nine competitors in the class for heavy cars, but Gabriel, who did the distance in the best time, namely 5 minutes and 12 seconds, was disqualified because he had not given notice that he was driving the Mors car which was put down in Mr. Amblard's name. The winner was therefore Mr. Willy Poege on a 60-horse Mercedes, who did the distance in 5 minutes 13 and 3-5 seconds. A Mors was second, a Gobron-Brillie third, a Panhard fourth and a Gardner-Serpollet fifth. In the light cars Beconnais on a Darracq was the winner in a record time for light cars, namely, 5 minutes 23 seconds. Baras on a Darracq also took the second place. A win and a record also fell to the Darracq in the voiturette category, where Villemain accomplished the distance in 6 minutes 11 and 3-5 seconds. Lamberjack on a Griffon won the light motor-bicycle section in 6 minutes 37 3-5 seconds, and Sauveniere (Clement) the heavy class in 6 minutes 16 and 3-5 seconds.

On Monday the touring cars made a series of five kilometre trials against the watch. Class I., chassis costing less than £160, was won by Comte Liedekerke on a Vivinus (6 min. 3½ sec.). Class II., chassis costing less than £240, Baras on a Darracq, (6 min. 52½ sec.). Class III., less than £400, Cailliois on a Serpollet (3 min. 35½ sec.). Class IV., under £600, Elskamp on a Gobron Brillie (4 min. 26 sec.). Class V., under £720, Huet on a Peugeot (4 min. 43½ sec.). Class VI., over £720, Poege on a Mercedes (2 min. 50½ sec.)

THE reliability trial which was to have been held by the Dutch Automobile Club from the 21st to the 24th inst. has been postponed until September.

FROM the Touring Club Italiano, whose headquarters are in Milan, I have received a copy of the "Annuario Generale, 1903." Although some idea of the completeness of the Annual may be gathered from the fact that it comprises three distinct volumes, it is only by glancing through its pages that the thoroughness of the work is appreciated. Vol. I. is devoted to general matters and information regarding Italy. Vol. II. deals mainly with information regarding touring in foreign countries, and contains details of all the leading automobile clubs throughout the world, while Vol. III. forms practically an Italian

The Castle of Simancas, where the Spanish Archives are preserved.

(Clippings Rebound.)

THE PARIS-MADRID TOUR.

Gazetteer, giving the names of hotels, doctors (a strange inclusion), etc., in all the principal towns and villages. Altogether, the Italian Touring Club is to be congratulated on its 1903 Annual.

THE Kent Automobile Club will hold a run to Herne Bay to-day (Saturday).

ON Wednesday next the Southampton County Motor Club will hold a run to Plaitford.

THE Lea and Francis Motor Syndicate, Limited, has been formed in Coventry with a capital of £10,000.

THE Sheffield and District Automobile Club will hold a run to Buxton to-day (Saturday).

TO-DAY (Saturday) the Wolverhampton and District Automobile Club will hold a run to Albrighton, via Shifnal.

"TRUTH" remarks that there has been such an outcry against motor-cars recently that it becomes necessary to remind County Justices that it is their duty to administer justice, and not prejudice.

THE Coventry Motor Fittings Co., Coventry, have been experimenting during the past season with various kinds of honeycomb radiators, and are now making a standard type which they consider, for efficiency, will rival any of Continental manufacture. In evidence of this they are now supplying their radiators to several leading British firms.

Motor Wagons for the Russian Dockyards.

SOUTH AFRICAN NEWS.

[FROM OUR OWN CORRESPONDENT.]

CAPE TOWN, June 13th.

AMERICAN-built cars are in distinct disfavour in Cape Town, being too light in build. A well-known Cape Town motorist, who knows South Africa from end to end, and who has driven his car all over Cape Colony, tells me that the principle of American cars is excellent, and that if only their manufacturers would realise the necessity of putting more substantial work into their products, a large sale for these would result.

I SEND a photo of a "Gladiator" car, taken in Pretoria. The gentleman at the helm is Mr. Russell Wallett, late leading comedian with Mr. Fred. Mouillot's Musical Comedy Co., which has just closed a most successful tour through South Africa. The

lady seated by his side is Mrs. Russell Wallett, and the gentleman seated in the tonneau is Mr. Atkey, of Nottingham. This firm have, as you already know, acquired the business of the Johannesburg Motor Car Co., and now trade under the name of the Johannesburg Motor Mart, under the supervision of Mr. Frank Whittaker.

MOTORISTS are very wary of the police in Cape Town now. All sorts of distances are marked off, and two well known motorists have had letters of warning from the Commissioner. Constables have had instructions not to take anybody's name and address, but to march them straight away to the charge office. These regulations came into force about one month ago, but, just to show you what a law-abiding crowd we are, no one has been run in yet.

MR. M. IRVING, manager of the Dunlop Motor Company, expressed the opinion to me the other day that British manufacturers had not paid sufficient attention to turning out petrol lorries and delivery vans at a reasonable figure. A man can buy a good car at a low figure now, but the prices of heavy wagons are altogether too high. A big brake, say about 16 horse power, to carry about twenty passengers, and geared so as to run over all sorts and conditions of roads, would be a regular gold mine for anyone to run on interurban service in the Colony. When Mr. Menzies was taking the Daimler 12-h.p. lorry from Cape Town to Clanwilliam, he was on several occasions offered as much as fifteen pounds (£15) by travellers who wished to go from town to town. For a man

to drive a motor-vehicle up-country, he must thoroughly understand his trade. Between Ceres and Calvinia there is a stretch of a hundred miles of absolute desert over which the road between these two towns passes. Nine times out of ten, when travelling along this road, one will not meet a living thing, much less a human being. Nothing but scrub right away as far as the eye can see. The distance between Ceres and Calvinia is 150 miles, which Mr. Menzies reckons could be done in three days, regularly. Provision must, of course, be made for carrying baggage, and this must not be on the roof, as it would make the car top-heavy, and render it liable to overturn when running over the rough South African roads. I think that the question of rapid passenger and goods transport between up-country towns is going to be a big one, and that the automobile will play a big part in the opening up of the country.

THINGS are humming in Johannesburg. The Johannesburg Motor Car Co., under the supervision of Mr. Frank Whittaker, are doing a splendid trade. One of the best-known motorists in that city, a partner in the famous firm of H. Eckstein and Co., has recently headed a list of subscriptions for road improvements in and around Johannesburg with the princely donation of £1,000.

MR. DONALD MENZIES has recently returned from a trip from Cape Town to Port Elizabeth and back, which was eminently successful. The car was a 6½-h.p. "Gladiator," the same car on which Mr. Menzies made his 480 miles trip and also climbed up to the summit of Signal Hill.

MESSRS. GARLICK'S Motor and Cycle Supply, managed by Mr. Wm. M. Jenkins, are at present engaged in equipping a fine garage in this city. No expense has been spared in fitting up the garage, and a large staff of expert workmen has been engaged. Messrs. Garlick have on the water a 24-h.p. Darracq of a similar type to that recently purchased by King Edward, as well as three of the new 6½-h.p. Rambler cars.

By this mail I am sending you a photo of a "Star" car, with Dr. Fitzgerald at the helm, and the Hon. Arthur Douglass, M.L.A., Minister of Works for the Colony, on his left, two of his staff in the rear, and Mr. Marsh with one of the latest "Humber" motor-cycles at the side. The photo was taken

during the Hon. Arthur Douglass' visit to Grahamstown. I may add that the car was a special one got out by Messrs. Davies Marsh and Company, of Grahamstown, for the Dr., and is the first car that has made a success at climbing the hills in that district.

SOME USEFUL NOTES.

MANY owners of motor-cars fail to recognise the fact that their cars depreciate very rapidly in value by not being properly cleaned. The mud is allowed to dry on the paint and leave spots, instead of being washed off immediately the vehicle has returned to the garage. The motor becomes coated with grease and dust, and the entire vehicle rapidly puts on a dirty and second-hand appearance. On the other hand, there are cars which, after running thousands of miles, look almost as well as they did the day they were turned out from the factory. To remove dust from the paintwork a large common painter's brush is, remarks a writer in the "Automobile Magazine," as good as anything; but in muddy weather a soft sponge with plenty of water should be used. The sponge should be plunged frequently into the water and "dabbed" on the mud; do not attempt to wipe it off, as this will scratch the varnish. When every vestige of dust or mud has been removed the car may be wiped down with a soft chamois leather. Not even the brush, sponge, or leather should touch any greasy part, or it will spoil the gloss of the varnish. Separate cloths or leathers should be used for the motor and the gearing, these parts being finished last, and care being taken that no grit or dust be wiped into the bearings. It is needless to add that all lubricators, tanks, etc., should be closed during cleaning operations. After having removed all the dirt and water from the car, wipe the bright parts with a rag having a little vaseline on it, and give the chains a coating of tallow and blacklead, which can be kept ready mixed, and applied with a brush like that used for cleaning.

ALL dirt should be washed off the tyres, and, having dried them carefully, cuts and bad places should be cleaned out with benzine and then plugged and cemented with pieces of pure rubber and solution, so that they may be allowed as much time as possible to harden before being again used. On no account should a deflated tyre be allowed to support the weight of the car. If it is not convenient to repair the tyre at once, the weight of the car should be taken off it by a jack or other support.

TYRES should always be kept as hard as possible without exceeding the pressure that the tyre is able to stand. If the tyres are allowed to remain soft, the internal friction set up is very great and will eventually tend to perish the rubber and canvas, injuring the tube and causing much trouble later on.

THE necessity for something with which to carry water or petrol is recognised by many tourists, and to meet this need folding rubber pails have been put on the market. These, however, are not suitable for petrol, and do not meet the requirements as fully and cleanly as a little device used by Mr. C. E. Duryea. Since it is common practice to carry lubricating oil, a plain can large enough to telescope over the lubricating oil can requires no perceptible additional space, and makes a handy affair with which to dip water, carry petrol, or serve as wash basin for cleansing one's hands. It is just as valuable for one liquid as another. It stands alone, which some folding pails do not, and in many respects is superior. If of rectangular shape liquid may be poured from one corner without the use of a funnel. It can be made by any tinsmith at a small cost, and should have a stiff wire around the top on the outside, which not only preserves its shape and makes it better to handle, but forms a lip which prevents the liquid from running down the outside of the can.

IN putting in copper-asbestos washers, they should always be slightly rubbed with blacklead, when the parts screw together, as in the case of sparking plugs and some inlet valves. Where valves are held down by a bridge and nut, the latter cannot always be given sufficient pressure to make a tight joint, and it is advisable to tap the valve-seat all round with a mallet, when in place, to bed the copper washer down and ensure a good joint. The small American raw-hide mallets are most useful for this and similar purposes in the car-shed.

A CORRESPONDENT writes that experience with spark-gaps on several different types of cars with medium-speed engines shows that they distinctly slow the ignition. The advance spark lever in each case required to be two or three notches in advance of its usual positions at different speeds. We should be glad to have the experience of other motorists on this point.

IN re-packing a pump gland use plenty of graphite with the packing. The spindle is seldom sufficiently lubricated, and the graphite will go a long way towards remedying this. Glycerine in the cooling water, as a frost preventive, seems incidentally to considerably assist in lubricating the pump spindle. We have noticed it has been less frequently necessary to take up the packing during the winter in a car where it was employed.

WHERE there are facilities for accumulator charging at home, from a lamp bracket, it should be remembered that frequent charging for a short time is better for the accumulator than occasional charging for a long time, and, if anything, more economical.

FLYWHEEL WEIGHT.

THE most advantageous and the smallest practicable flywheel capacity for petrol motors are still mooted questions in automobile design. Increasing the flywheel capacity generally reduces vibration and the fluctuations in rotative speed, and increases the speed range of the motor and the ability of the vehicle to start on hills or in difficult places. The only disadvantageous feature connected with increasing the flywheel capacity is that extra weight must be carried. It may be of interest to examine the various disadvantageous results of insufficient flywheel capacity. No theorizing is required to prove that when an engine is equipped with too small a flywheel it vibrates excessively; this fact is patent to all who have had experience in engine building. The fluctuation of the motor speed when the flywheel is too small is a very serious defect. It subjects all the parts which are driven by the engine to very much greater stresses than if the engine speed were absolutely constant.

Suppose that when the motor runs at its normal speed there is a fluctuation between impulses of 5 per cent. When the vehicle runs at a fair rate of speed on level road, its speed could hardly be expected to vary that much in the short time between impulses. Yet, if the motor lost momentum quicker than the vehicle, part of the time between impulses the vehicle would impart power to the motor, and for the rest of the time the motor would drive the vehicle. The power applied by the motor to the vehicle would rise from zero to a maximum and fall to zero again in each period between impulses. For a given average power the maximum power and pressure would, therefore, be much increased by a slight fluctuation in engine speed. The pressures on the gear teeth and the stresses in the chains and tyres would be variable, and consequently much more severe than otherwise. The case here assumed is, of course, exaggerated considerably, but even under actual conditions the fluctuations in engine speed are a serious factor, and should be kept as low as possible.

It is, of course, understood, remarks the "Horseless Age," that a multi-cylinder engine requires less flywheel capacity than a single cylinder, a high speed engine less than a low speed, and a low compression engine than a high compression. No harm can result from providing a little more flywheel capacity than absolutely required. The tyres will profit more from the greater uniformity in the propelling power than they will suffer from the increased weight to be carried. With less vibration the car will be more comfortable to ride in. The motor will run at a slower speed with full throttle opening, since the heavier flywheel will overcome the compression resistance at a lower speed. A little flywheel weight above that absolutely required is not simple dead weight; it is beneficial in a number of ways.

HERE AND THERE.

THE Duke of Manchester has, we learn, just purchased a 24-h.p. Continental car.

MESSRS. EVART-HALL, LTD., have just supplied a 15-h.p. C.G.V. car to Lord Onslow.

HEREWITH we give an illustration of the motor-omnibus running between Lewisham and Eltham. It is a German Daimler vehicle, capable of carrying 27 passengers and weighing com-

plete about 5 tons. The Sirdar Co.'s 3in. high-speed Buffer tyres are used, having, we understand, given great satisfaction, both from the point of view of wear and of preventing side-slip.

MR. H. FRIEDENHAIN, of 16-20, Farringdon Avenue, London, E.C., has been appointed sole agent for the ignition specialities of L. Gianoli, of Paris, and has issued a wholesale price list of motor accessories and fittings.

MESSRS. W. GUEST AND SONS, of Sheffield, have just brought out a new compound known as "Puncture" for sealing punctures in the inner tubes, or filling up cuts in the outer covers, of pneumatic tyres without the use of patches.

THE British Motor Fittings Company have opened an office and show-room at 32, John Bright Street, Birmingham, under the management of Mr. F. W. Carpenter, where samples may be seen of their various manufactures, e.g., engines, gear cases, steering gears, and other parts of motor-cars.

THE Wigton rural councillors have doomed the motor-car to oblivion. By the spin of a coin—in lieu of the chairman's casting vote—they passed a resolution "strongly protesting" against any extension of speed of motor-cars, and suggesting the licensing of drivers, with various pains and penalties for defaulters.

THE Wolseley Company have sent us the official times of the 50-h.p. racer driven by Mr. S. Girling in the Circuit des Ardennes. This was 8 h. 48 min., which works out at the rate of 36.8 miles per hour. Except for tyre troubles, the car would have been well classed, one of the circuits having been made in the second fastest time.

THE growing importance of the automobile industry has induced the Case School of Applied Science of Cleveland, U.S.A., to pay particular attention to this new branch of engineering, and a laboratory for the study of automobile equipment is to be fitted up in time for the opening of the autumn course.

THE employees of several firms in Coventry held their annual outing on Saturday last. Those of the Motor Manufacturing Company, Limited, spent the day at Bristol and Ilfra-

combe. Between 40 and 50 employees of the Doherty Motor Accessories Company held their outing to Stratford-on-Avon. The weather was brilliantly fine and an enjoyable day was spent.

A HILL-CLIMBING test will take place on the Sun Rising Hill, Edgehill, Warwickshire, on the 25th inst., under the auspices of the Midland Automobile Club. The object of the competition is to test the powers of petrol cars in starting, stopping, and re-starting upon steep hills, without the use of the sprag or ratchets. Mr. Broughton Dugdale, president of the Midland Club, is offering a cup to the owner of the winning car.

IN addition to the electrification of the Tyneside branches and the construction of motor-cars to run on the railway between the Hartlepoons, the North-Eastern Railway Company have now decided to establish a regular motor-car service on the old Bridlington coaching highway between Beverley and several of the outlying villages as far as Beeford, a distance of thirteen miles. The cars for the service are being built by Messrs. Stirling's Motor Carriages, Limited.

SPEAKING at the annual meeting of Messrs. Greenwood and Batley, Limited, of Leeds, last week, Mr. A. Greenwood stated that in regard to the electrical department itself he had to tell the shareholders of a new departure, which was now fairly launched. It was the manufacture of electrically propelled motor-cars. A new system had been secured by the company, and arrangements had been made with the Electromobile Company, Limited, who were successfully introducing those motors in the form of landaus, coupes, etc., in London. A considerable quantity of these carriages were now running about the metropolis, and the company were turning out quite a number of them monthly.

THE Lancashire Steam Motor Company have secured an order for two of the four ton standard tip wagons for the Chelsea Vestry, a body which has had about three years' experience with two of these vehicles. The only difference in the repeat order is that interchangeable bodies are to be supplied, so that either a tip body or watering van may be used. The Lancashire Company expect to make a start in the first three bays of their new works in about a month from now. The land they have secured covers 6½ acres. This addition to the existing works will enable them to turn out three complete motor-vehicles per week.

MESSRS. MERRYWEATHER AND SONS, LTD., of Greenwich, have lately supplied a motor fire engine to the Portsmouth Fire

Brigade. The machine has a pumping capacity of 400 gallons per minute with 40-h.p., carries 40 galls. of liquid fuel and 100 of feed water, and runs on solid rubber wired-on tyres 4 in. wide. The vehicle was taken down to Portsmouth by road under its own steam, the accompanying illustration showing the passage through the town of Petersfield.

THE Automobile Club de Bretagne has just been formed at Nantes.

THE A.C.G.B.I. quarterly 100-mile trial will be held on Friday, the 24th inst.

OWING to the increase of their business, Messrs. Geipel and Lange are removing to new and more commodious premises at 72a, St. Thomas Street, S.E.

A NEW device for preventing tyre punctures, and also, at the same time reducing the chance of skidding and side-slipping, has recently been put on the market by Messrs. John Wheeldon and Co., of the Alma Rubber Works, Sheffield. The Guard, as it is called, is made of strong flexible fabric or cloth, in the shape of a thin band between which small sections of flat steel are placed, and firmly held in position by a strong elastic cement. The band is so flexible and pliable that it readily accommodates itself to any movement there may be in the tyre, thereby retaining the natural buoyancy and resiliency. The numerous small sections of thin steel are arranged side by side, and end to end (not overlapping), between the two strips of fabric, so that when the band is fixed between the inflated air tube and the outer tyre or cover, and by the pressure of the former it, in effect, practically presents a solid metal surface on the tread of the air tube. Tyres fitted with the Guard have been subjected to the test of running over a long trail of iron tacks, old and bent nails, screws, and broken glass bottles, etc., and for many months past have been used on

Fig. 1.—Section of Guard with upper covering removed to show metal section.

Fig. 2.—End Section with upper covering in place showing metal section between the fabric.

bicycles and motor-cars over rough country roads, in some cases over 1,000 and 2,000 miles, without being taken out, and without a single puncture, proofs being shown by the presence of nails, etc., in the outer cover, that punctures must have occurred had not the Guard been fitted. The Guard, which is very light in weight, is claimed to not only protect and preserve the air tube, but protects and prolongs the life of the outer cover. It is easily put in the tyre, it being simply laid straight and flat in the centre of the inside of the outer cover, no fastening whatever being required. It is not only as a puncture preventer that the Guard is useful. By its novel construction, and virtually forming a solid metal face under the tread of the outer cover or tyre, it is claimed that a firm hold or grip on the tread of the tyre is ensured. In fact, Messrs. Wheeldon state that, after many exhaustive tests, under all conditions on greasy inclines and bad roads, they have proved conclusively that the Guard prevents sideslips or "skidding."

REPLYING to Mr. H. Hobhouse in the House of Commons, as to whether any public authority had power to regulate the width of tyres of motor-cars between one and three tons in weight, Mr. Long has stated that in Section 6 of the Locomotives on Highways Act, 1896, the Local Government Board, under an order dated Nov. 9, 1896, had made the following regulations as regards the width of tyres: If the weight of the vehicle unladen is more than 15 cwt. and does not exceed 1 ton, the width of the tyre is to be not less 2½ in.; if such weight is more than 1 ton, and does not exceed 2 tons, the width is to be not less than 3 in.; if such weight exceeds 2 tons the width is to be not less than 4 in.

THE accompanying photograph is of a steam car built by Mr. A. G. Ainslie, Leeds. Commenced before the Light Locomotives Act, 1896, was passed, it possesses some interesting features. The engines, boiler, wheels, carriage, etc., were all made by the builder in spare time, from his own designs. The vehicle was constructed to carry four passengers, and on a trial run took that number up some stiff inclines at a fair speed. The water tanks and fuel bunkers are fixed under the seats, while starting and steering levers, foot and hand brakes, steam and water

gauges are all placed near the driver. The engine has two cylinders 2½ in. diameter, with a stroke of 4 in., fitted with ordinary D slide valves operated by Stephenson's link motion as used on locomotives. Water is supplied to the boiler by an injector and a force pump worked from the crank shaft. Mr. Ainslie is now engaged in re-modelling the car. The same engines are being used, but a more powerful boiler is being fitted, this being intended to work at a pressure of 300 lbs. per square inch.

THE London Autocar Company, Limited, have just issued a new and complete catalogue of motor-car and cycle accessories.

MESSRS. W. H. BUXTON AND Co. have been appointed agents for Liverpool and District for the "Pipe" and "Magnet" cars.

MR. C. R. BASE, the well-known motorists' tailor, has now opened a department at Friswell's, 1, Albany Street, Regent's Park, N.W.

DURING the months of May and June no less than 62 motor-cars were turned out from the works of the Hozier Engineering Co., Bridgeton.

WE have received a circular from the Snefield and District Automobile Club, from which we learn that the membership now comprises nearly a hundred names.

MR. T. H. HOLDING, the well-known motorists' tailor, has just brought out the new motor-car drivers' coat illustrated herewith. The coat is made in all shades of melton, box cloth, etc.

MESSRS. MANN, EGERTON AND Co. have sent us a photograph of the fine new garage they have recently opened in Prince of Wales Road, Norwich. The photograph was taken on the day of the annual auction, and gives a good idea of the very large size of the building, which will hold about sixty cars.

At a meeting recently held in Manchester it was unanimously resolved that it is desirable to hold an International Exhibition in Manchester in 1905, and a committee was appointed to take such steps as they consider necessary to ascertain the views of those likely to be interested in such a project.

MOTOR-CYCLING NEWS.

A COUPLE of motor-cycle events were included in the Manchester Wheelers' sports on Saturday last. The attendance was estimated at 21,000. The mile motor-cycle (scratch race) resulted as follows:—H. Martin, Croydon, first; S. Wright, Dublin, second; L. Myerscough, Great Crosby, third. Won by 30 yards; time, 1min. 36 1-5 sec. A two miles motor-bicycle scratch race was won by S. Wright, Dublin; H. Martin being second; and J. Edge, Anfield, third. Won easily by 50 yards; time, 3min. 4 4-5sec.

THE Motor Cycling Club is holding another 200 miles Reliability Trial on Saturday next. Any motor-cyclists who will be willing to act as observers or checkers on that day are requested to communicate with the Hon. Sec., Mr. G. E. Roberts, 17, Fieldhouse Road, Hyde Farm, Balham, S.W.

THE Rex Motor Company, who have thoroughly studied the question of forecarriages, have lately brought out a new design of two-seated vehicle, to which they have given the name "Tricar." The permanent character of the combination makes in reality a light motor carriage, without the complications necessary in a voiturette. The main stays of the carriage extend back to the rear of the machine. The ballhead column is so designed that it is strongly fitted from the engine cradle to the main frame of the carriage. The body is of a luxurious description, being a bucket seat carried on special springs. The steering is very sensitive and safe, the makers claiming that a speed of thirty miles can be obtained without the least danger. The machine is fitted with a special Rex 3½ actual h.p. engine and will take practically any hill without assistance. A distinct feature of the machine is the introduction of the wind catcher cowl, which concentrates the rush of air to the engine and diminishes the tendency of the latter to overheat.

MR. GEORGE A. WYMAN has just completed the journey from San Francisco to New York on a motor-cycle, being the first rider to accomplish the feat. He took fifty days to journey from San Francisco to New York, and for several hundred miles he had recourse to the railway track, while for long distances the roads were so bad that riding was impossible.

OWING to many of the principals of firms connected with the trade being in Ireland during the past week, it has been decided to accept entries for the motor-cycle reliability trials until noon, Saturday, the 18th inst., without payment of extra fee. After this date the entrance fee will be increased 25 per cent. until the 25th inst., when the entries finally close.

A SMALL but notable feature of the "Brown" motor-bicycle is the oil-retaining engine pulley. The accompanying illustration shows that the centre of this pulley is hollowed out to catch the waste oil which finds its way through the main

bearing, and by removing a screw the oil can be drained from the pulley after the day's run. This entirely prevents the oil reaching the belt, and obviates one of the greatest troubles of the motor-cyclist—the slipping of the belt.

MESSRS. MILLS AND FULFORD, of Coventry, who have for sometime made a speciality of trailers, have now brought out the sociable attachment for motor-bicycles illustrated herewith. It is known as the Duadcar, and is so arranged that it can be

quickly attached to either side of a motor-bicycle. It can also be supplied with a trailing rod and an extra wheel, allowing the attachment to be used as an ordinary trailer when desired.

A BARNESLEY motor-cyclist was last week fined 10s. and costs for not having taken out a licence for his motor-cycle. An Ebbw Vale rider has also been summoned on a similar charge. In this case the Bench were of opinion that although defendant had been negligent he had no intention to defraud, and ordered him to pay costs only.

A LETTER has been sent to the Secretary of the Auto Cycle Club by the "Singer Cycle Co., Messrs. Bayliss, Thomas and Co., Humber's, Rex Motor Manufacturing Co., Messrs. Hobart, Bird and Co., the Coventry Eagle Cycle Co., and the Quadrant Cycle Co.," with regard to the conditions of the motor-cycle reliability trials. In the letter it is stated that the conditions imposed by the committee appear to be much at variance with what might reasonably be considered to constitute reliability of motor-cycles. As regards Rule 27, exception is taken to the system of marking for the following reasons:—"We consider that for a roadster machine to be subjected to a speed trial on the track is altogether a mistake. The question of lightness is a very immaterial point in a motor-cycle. The question of price is one that should not enter into the committee's calculation. Rules 28 and 51: We consider these somewhat contradictory one with the other. Rule 37—Hill climbing: Hill climbing appears to us to be one of the important points of motor-cycling, and it is essential that marks should be given for machines that climb the hill best without pedalling; in fact, we go so far as to suggest that pedalling should not be allowed. It also appears to us strange that tricycles and tandems are, by the weight limit, debarred from entry, while we take Rule 8 to read that when the bicycle is combined with fore-carriage the weight only of the bicycle is taken into account. We recommend that the marks allotted for price, lightness and track racing should be transferred to reliability and hill climbing. Our objections to the present rules are so serious that we are afraid, unless altered, we cannot, in justice to ourselves and to the public, enter the competition, the conditions being, in our opinion, entirely against the majority of high-class machines."

BARON SPECK VON STERNBERG, the new German Ambassador at Washington, has become an enthusiastic automobilist.

AT a meeting of the Llandoverly Town Council last week, a suggestion that the Council should support Lampeter in their light railway application fell through, motor-cars being favoured.

CORRESPONDENCE.

THE INADEQUACY OF THE NEW BILL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The first sub-section runs in these words:—"If any person drives a motor-car on a public highway recklessly, or at a speed which is dangerous to the public, having regard to all the circumstances of the case, including the nature, condition, and use of the highway, and to the amount of traffic which actually is at the time, or which might be expected to be on the highway, that person shall be guilty of an offence under the Act." On Thursday last I was the victim of the Bingham Court in a fine of £10 and costs, although it was my first offence; no one was proved to be endangered, and it was stated that my car was used by me as a business vehicle as commercial traveller. This is my fourth season of motoring, and I have doubtless driven over 50,000 miles, and have never before been even cautioned by police. I have found my car a great success in my business, but I fear for some years I shall have at least to "go back" from my 12-h.p. "Progress" to something very much more unpretentious in the solid-tyre line, just for local journeys only, and so take my longer journeys in the old, miserable way per trains and "hay motors," as I see no relief in the new Bill from the clause quoted by me above. I truly hope that this particular clause may yet be amended.—Yours truly,

R. R. LATHAM.

THE SPEED TRIALS IN PHOENIX PARK.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Have the Automobile Club formulated a new system of running off contests? Why I ask is because I saw the various heats of the tourist class cars run off, altogether nine heats of two cars each, and then the final heat, in which only two cars competed. This seemed to me to be a very funny way of doing things, and absolutely at variance with the usual way of carrying out races. The coupling in the heats, too, seems to have been most extraordinary; for instance, two 20-h.p. M.M.C. cars were pitted against two 10-h.p. cars, Panhard and Brush. Of course the M.M.C.'s won their heats without the slightest difficulty and without having to hurry. This leads me to the assumption that the two M.M.C. cars, although running, did not do their best in their heats because it was not necessary, their opponents being much slower cars. Consequently, because of this erratic coupling, it is quite probable that they lost their chance of the prize. I imagine that they would have made faster times had they had cars of their own mettle to run against. It is proved by the winner's times that the fact of his being obliged to do his very utmost in the final made him get more out of his car. His first time was 2 min. 11 sec., and his final 2 min. 6 sec.

I questioned some of the drivers of cars in the contest afterwards, and elicited the information that they were quite unaware before the race was run that it would be carried out in the way it was, and Mr. Burgess said he could have got more out of his car if it was necessary, as its accelerator had several more notches to go. I advised him to protest. I most certainly should had I been in his position. I do not hold a brief for the M.M.C., but mention them specially because of the way they were matched.—Yours faithfully,

W. ETHERINGTON.

A PLEA FOR THE LIGHT RACING CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a motorist, but as one with no real practical experience, I quite agree with your correspondent's remarks in your last week's issue as to the inadvisability of building cars with such powerful engines when, on comparison, motors of lower horse-power show to much greater advantage. For instance, I recently made a motor tour through France, when my attention was drawn to the "Moto-bloc" car, which ran in the recent Paris-Madrid Race; this car, although of 12 horse-power (120 mm. cylinder by 120 mm. stroke), reached Bordeaux in 9 hours 10 mins. 47 secs. (an average speed of about 40 miles per hour). This, without doubt, I consider an exceptionally fine run for a motor of such low horse-power, and I think you will agree with me that it tends to show that it is quite unnecessary to use such enormous high-power motors.—Yours truly,

CHARLES HANSON.

MOTOR-CAR RACING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will you kindly allow me a little space with reference to motor-car races or tests of same? We all cannot help but take an interest in the Gordon Bennett race, etc., but at the same time, in my opinion, it would be more useful to the classes in general if there was a race or races by cars, say, from 3-h.p. to 20-h.p. These are cars that are required every day, and I for one am looking out for a serviceable car. We all want the best procurable on the market, but what can we glean from such highly-powered cars as 50 to 90-h.p. for general use? Let us have proper tests, such as hill-climbing, etc., by smaller cars, and then the public will have that which they are continually wanting.—Yours truly,

E. BRADLEY.

SURREY POLICE TRAPS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—There is an electrically-timed police trap going down to Merstham, also one on the switchback over Redhill Common. The Epsom trap is worked in this way. Somewhere in East Street there is an electric bell which a man rings as the car passes. A sergeant—placed generally by the Spread Eagle—starts his watch, and if the car is the slightest bit over the legal limit when it arrives at his station (i.e., opposite the Spread Eagle Hotel, in the middle of High Street, Epsom) it is stopped, and a summons is sure to follow.

I found the Epsom trap out in a curious manner. On Sunday morning, coming down Church Street and proceeding along High Street at seven miles per hour, I was called upon at the Spread Eagle to stop, another car which came along East Street being on the point of passing me. The following conversation ensued.

P. C.: Your name and address?

Motorist: Whatever for? We were only going a walking pace.

P. C.: Your name and address?

Motorist: Nonsense, man! Why I live here, and have come slowly.

P. C.: Where do you live?

Motorist: In Church Street.

P. C.: I thought you had come down East Street. You may go on.

Motorist: That's all very fine, but what do you mean by stopping me? I could, however, get no satisfaction. Next day, Monday, I attended the Petty Sessions and applied to the magistrates for their protection and assistance—couldn't get either. I then applied for a summons for an assault (technical)—not granted. I then asked for a summons for a malicious endeavour to incite and provoke a breach of the peace, but had to be content with the local inspector taking down my written report, which is to be submitted to the Commissioner of Police. There was no excuse I can see for thus treating me as an outlaw, but no doubt I was taken for the driver of the car which had come down East Street. As I explained to the magistrate, I don't mind being robbed for going fast, as I have a separate P.O. Charity Savings Bank account in which I put all my former customary donations, and draw on it as fined.—Yours truly,

EPSOMITE.

COST OF UPKEEP.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read the letter from Mr. Wingfield in your issue of the 27th ult. with regard to his 6-h.p. M.M.C. car, and, without wishing to be rude, must say I cannot understand what he has been doing with his car. I have a 6-h.p. M.M.C. car, which I purchased in the beginning of 1902, and I have run altogether nearly 10,000 miles. The total cost, including insurance and all repairs, but not including any police court fines which I am sorry to say I have had to suffer from on more than one occasion, works out at 1'02d. per mile. When it is taken into account that I nearly always carry four persons I am sure you will agree that I have nothing to grumble at from my car.—Yours faithfully,

W. G. SHERINGTON.

ANTAGONISTIC DRIVERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It may amuse and instruct your readers to know that a little time ago a friend asked me to get for him a capable man—able to drive pony, look after garden, or clean motor, etc. I at once advertised: "Coachman-gardener wanted; pony; boy helps, must understand cleaning motor; rooms; wages, £2 5s.," which was what my friend offered. Result was numerous applications; and now when I drive out my motor all coachmen make way for me, many touch their hats, and as to gardeners, they stand with scythe in hand ready to cut down any person who would get in the way of the motor. It has developed a new idea for them, this advertisement, and if all your readers were to try and help this class, there is no doubt but that there would be less prejudice against the motor.—Yours faithfully,

I. C.

QUERIES RE RUST AND CLUTCHES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Can any of your readers tell me (1) How to remove rust and lime from the inside of the water jacket of my cylinder? The water here is very hard, and contains much iron, and I cannot procure soft water. (2) The right kind of leather to use for the friction clutch of a motor? (3) In removing the clutch for the purpose of renewing the leather, is it necessary to use clamps to overcome the spring? I am a man of moderate means, and do nearly all repairs myself. These are things I do not know, and should like some hints.—Yours truly,

"A MAN OF MODERATE MEANS."

SEQUEL TO THE WALK TO BRIGHTON.

In the City of London Court, before his Honour Judge Rentoul, K.C., last week, Mr. André J. Moyses, stockbrokers' authorised clerk, sued the Central Motor Company, Limited, for £20, as damages for breach of contract. The defendants counter-claimed for five guineas. The plaintiff said he hired a motor-car of the defendants in order to go to Brighton and back, as he wanted to see the walking competition. The car was

ordered for ten o'clock, but it did not arrive until one o'clock. It reached Brighton at seven o'clock after several delays. On the return journey many stoppages occurred owing to the car being defective, and at last at Handcross it broke down at half-past two in the morning. He and his friend had to walk to Three Bridges, and stay on the platform until 7.30, when they took train to London. For the defence it was stated that no real damage had been suffered. The car was an ordinary machine "with all its vices," and was not a paragon. Motor-cars were notoriously uncertain. The road was dark, and the car did not break down. The water ran short, and then the plaintiffs walked off instead of waiting. The jury found for the plaintiff for a farthing on the claim, and on the counter-claim, the plaintiff received an order for his costs.

POLICE TRAPS.

THE furious driving cases at Woking are the result of Sergeant Jarrett's watchfulness on the Ripley road.

THE police have marked out a furlong in Hyde Park, and are taking the speed of all cars that pass over it.

THE furious driving cases at Garstang are the result of a measured quarter-mile on the Garstang road, at Cloughton.

THE police are timing motor-cars between the fourth and fifth milestones on the road between Ledbury and Ross, Worcestershire.

A READING correspondent writes:—"Police traps thick on Bath Road between Reading and Newbury; twelve miles strictly."

A CHISWICK reader sends us the accompanying sketch of a police trap

between Kew and Turnham Green. The diagram also shows an alternative route to avoid the trap.

A POLICE trap exists on the Great North road, about six miles north of Stamford, at a place called the "Bloody Oaks." Three or four motorists have been caught there.

APPARENTLY the style of house one lives in is to be a feature in future in fixing the amount of fine for furious driving, for in the course of a case at Croydon last week, the police-constable stated that the defendant lived in a house the rental value of which was about £50 a year.

A SLOUGH correspondent sends us the following particulars of a police trap in that town. On Saturdays, Sundays, and also in the evenings, two men stand at the beginning of the town, one having a pair of field-glasses, and the other a stop watch; by this means, every approaching car is timed over a measured distance. The two policemen accompanying them are in hiding twenty yards further on.

FURIOUS DRIVING.

THE magistrates and the police at the Reigate County Bench on Saturday were busily engaged in dealing with motorists who had been exceeding the speed limit. There were twenty-six cases for hearing, and the fines totalled up to £43 and costs. Of late the police have only devoted one day per month to catching motorists, but during June the 27th and 28th were set apart for this particular branch of constabulary work. It would seem, judging from the admission made by a police-sergeant, on being cross-examined by one of the defendants, that orders have been given that only drivers who are travelling at a speed exceeding twenty miles will in the future be summoned in the Petty Sessional division of Reigate.

An interesting case was heard before the Combe Martin county magistrates last week, in which Harry Jenner, the driver of the motor-bus between Ilfracombe and Blackmoor Station, on the Lynton and Barnstaple Railway, and in the employ of the Ilfracombe Motor Coach Company, was summoned for driving the motor-bus, "the weight of which unladen is one ton and a half and does not exceed two tons," at a greater speed than eight miles per hour, contrary to the regulations with respect to the use of light locomotives on highways made by the Local Government Board. Mr. Finch, who defended, addressed the magistrates, pointing out that ample time was allowed for the journey of eleven miles, which was scheduled and performed in one hour and a half. Defendant admitted that his bus was travelling between ten and twelve miles per hour. The magistrates announced that the defendant would be fined £3 and costs for having exceeded eight miles per hour. The chairman stated that, as this was the first case, the fine had been lower than it otherwise would have been.

STORING PETROL WITHOUT A LICENCE.

EDMUND ALEXANDER, of Lordship Lane, East Dulwich, was summoned last week by the London County Council for unlawfully keeping petroleum to which the Petroleum Acts 1871 to 1879 applied, without a licence, he having become unlicensed by reason of his having violated the conditions of the licence granted to him. Mr. Helman-Pidsley, from the solicitor's department of the Council, explained that in December last the defendant was granted a licence, which in the ordinary course would remain good for a year, to keep petroleum spirit on his premises. There were various conditions allotted to the licence, and upon any violation of them; the holder

was deemed to be an unlicensed person. On the 4th ult. one of the Council's officers found a can of petroleum spirit was being kept in the passage leading from the shop to the yard, the manager's explanation being that it was kept there for convenience. The defendant said the shop was under management. A proper store had been built in the yard, and his man had particular instructions to keep the spirit there and not to break the law in any way. What was done was not done by his authority or with his knowledge. A fine of £5 and 23s. costs was imposed.

CLUB NEWS.

YORKSHIRE AUTOMOBILE CLUB.

THE Committee of the Yorkshire A.C. decided to make special arrangements for their own members and friends to view the Gordon Bennett race, and some two or three months ago the hon. secretary, Mr. A. W. Dougill, and the hon. treasurer, Mr. L. Hey, visited the Course to find a suitable place for viewing the race. After inspecting miles of road and interviewing dozens of typical Irish people, who had plots of land to hire, a site was selected at Ardsclull. On Tuesday evening before the race the Y.A.C. party left Leeds per the L. and N.W. Railway Company, en route for Athy via Holyhead and Dublin, taking with them a tremendous pile of hampers of provisions for the camp which had been put up at Messrs. Powolny's. In due course, all were safely landed at North Wall, Dublin, in time to catch the early train, but owing to the crush of traffic the luggage could not be unloaded in time. At 12.20 all was on board, and the party enjoyed a ride as far as Kildare, and as the train was twice as long as any of the station platforms, many a laugh was enjoyed at the way the extraordinary traffic was handled. At Kildare efforts were made to send a telegram to Athy, but on presenting same at 2 p.m. the information was given that there were messages awaiting transmission since 9 a.m. As the camp was only twelve miles from Kildare, and there was a two-hours' wait for the train at Athy, some of the members suggested driving over by jaunting car, and accordingly prices were asked of several drivers, these showing a great difference, varying from 15s. to £3 for each car to carry four.

Eventually, about 6 p.m., camp was reached. This consisted of two large square sleeping tents, with wooded floors and mattresses to sleep on, one long dining-tent and a similar-sized kitchen tent. In about an hour after arrival the energetic waiters had a substantial supper laid out. The whole camp were ready for bed about 10 p.m., after having had a long day with practically no sleep on board the night before, and soon all was quiet, except for the toot toot of the horns of various belated cars travelling over the course. Early on the morning of the Gordon Bennett race day (to be precise, about 2.30 a.m.) there were sounds of rising, and there was a rush for the water tube. Promptly at 6 a.m. the constables cleared the road, and many were the attempts, mostly in vain, made by belated spectators to pass the police. Soon the English cars were in sight and received cheers as they passed. Then came a period of waiting until the first car made its appearance, and this was spent in having breakfast; then came a return to the stand to wait for the first car, and Edge was cheered on passing. Lunch at midday proved an interesting interval, as, owing to many of the cars dropping out, the race began to get rather slow. After lunch excitement was again provided by the American cars, which occasionally turned up unexpectedly. Tea was from four to five, and had been arranged to be taken outside on the stand, but, owing to the rain and thunder, was partaken of in the tents. After dinner most of the party strolled about gossiping with passing friends or walking on the Course until after dark. Then round the camp fire the tales of motoring escapes, and other camps were told, and finally bedtime came to close a never-to-be-forgotten day. Next morning, Friday, the early risers were up and about at 4 a.m., but some preferred to rest until breakfast time at 7.30. After this some of the party drove or walked down to Athy to catch the early train to Dublin, whilst others lounged about or went to the police barracks to see the Irish Constabulary going away. At 12.47 on Friday the remainder of the camp were on the train for Dublin, where some members preferred to stay for the Phoenix Park trials, whilst others made straight for home. Amongst those present were Messrs. Booth, Palmer, Harrison, J. Greenwood, Whitworth, Lynn, Braime, Beevers, Holgate, Winn, Vince, Duffield, Hill, Hales, Armitage, S. Whiteley, Owen Brooks, Borland, C. Atkinson, H. R. Kirk, R. Smith, I. Kirk, Walker, Gustwick, Habergam, and Jowett.

REFUSING TO STOP.

At the Leven Petty Sessions last week, P. Gaskell, architect, Hornsea was summoned for not stopping his motor-car on the Skirlington road when requested to do so in accordance with the provisions of the Light Locomotives Act. It was stated that complainant was driving from Aldbrough to High Skirlington about nine o'clock on the night of June 13th. On noticing the approach of a motor-car, complainant put up his hand and signalled for the driver to stop. When the car was practically under the horse's nose the driver blew a horn and the horse turned restive and backed the trap into a ditch. The damage to the trap was estimated at £2. Defendant stated that he had driven a car for two years, and that was the first complaint that had been made against him. He sounded the horn when 200 yards from the trap, and brought the car to a standstill when about twenty-five yards from the horse. The horse and trap were drawn across the road. One of the occupants of the car alighted and led the horse. The Bench found that the defendant had not exercised proper care, and fined him £2 and costs.

* Motor-Cycle Cases.

A BREACH OF CONTRACT CASE.

THE case of Luard v. Karminski came on for hearing at the London Sheriffs' Court last week.

Mr. A. Houston, counsel for plaintiff, in opening the case, said that in October, 1902, an agreement was entered into between the plaintiff and defendant, the latter being a motor-car manufacturer, of Strasburg, whereby plaintiff was to be sole agent in England for the sale of the cars manufactured by the defendant, who traded as Karminski and Co. According to agreement, the plaintiff purchased six cars from the defendant for £1,042 without tyres, and after freight and fittings had brought up the cost to £1,231, the cars turned out to be "absolutely useless."

He also bought, through Karminski, two 12-h.p. cars at £760, and then found that the proper price was only £550.

Mr. Edward Sydney Luard, the plaintiff, gave evidence bearing out counsel's opening. On each occasion when the cars were taken out for trial runs they broke down, and intending purchasers had to make their way home as best they could. The work of the cars was also inferior.

Further evidence showed that the only value in the six cars was in the material. If they were broken up the material would realise about £60 per car. The jury assessed the damages at £1,200. Judgment accordingly, with costs.

A BRIGHTON ACTION.

At the Sussex Assizes last week an action was tried without a jury, in which Mr. Muhlenkamp, of Brighton, sued the Brighton and Sussex Motor-Car Company to recover damages for breach of contract. The case for the plaintiff was that he ordered from defendants a Panhard car, with a Rothschild et Fils body, and with axles dropped as low as possible; but that a car was supplied with a Clement Rothschild body and with a straight axle at the back. The defendants alleged that plaintiff agreed to a variation of the contract, with regard to the Rothschild et Fils body, and saw the specification of the body which was supplied. They also stated that the axles were as low as possible. His Worship gave judgment for the plaintiff for £110—£80 in respect of the body, and £30 in respect of the axle.

A THEATRICAL MOTOR-CAR DAMAGED.

At the Shoreditch County Court last week, before His Honour Judge Smyly, K.C., Mrs. Florence D'Orsay, professionally known as Miss Marie Dagmar, sued the London General Omnibus Company, Limited, for damages to her motor-car used by her on the stage in the play, "A Life's Revenge." Mr. Bodilly, for Miss Dagmar, said that on April 20th last her motor-car was being taken to the theatre, and whilst in Kingsland Road the traffic was stopped. The driver of one of the defendants' omnibuses failed to stop, and crashed into the back of the motor-car. He was not quite sure what Miss Dagmar did with the motor-car on the stage, but that part of the play had to be eliminated, with the result that the takings of the play fell from £170 a week to £120. The collision smashed the back of the motor-car. Mr. Charles Warner, acting manager to Miss Dagmar, also said that the motor-car scene was the attraction of the play, and it was impossible to replace the motor-car under several weeks. For the defence it was contended that in re-starting the motor-car jumped back, and so damaged itself on the pole of the stationary omnibus. His Honour gave judgment for the plaintiff for £14 15s., the actual cost of the damage done.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

COMMENTS.

ELSEWHERE we record some impressions of the recent Irish tour which cannot fail to secure acknowledgment on both sides of the Irish Sea. The reliability of the motor-car has been demonstrated, and it has also been amply proved that it is not the death-dealing machine that some sensational journalists would have us believe. The A.C.G.B.I. is to be felicitated on the way the tour went through, although we cannot extend our congratulations to the way in which all the arrangements were carried out. These seemed to lack decision and definiteness. Early plans were abandoned without notice to those concerned, and new notions adopted with equal lack of publicity. Still the tour was successful in educating the public, and it now remains for the Irish people to learn the lessons set forth on another page, viz., to see to their highways, to erect signposts at cross roads, to moderate their notions of the wealth of motorists, and to seek to take advantage of the industry to foster their prosperity.

The Horse-Power of Petrol Motors.

OUR attention has frequently been called to the fact that the horse-power ratings of petrol motors, such as are used on motor-cars, are not at all times reliable; that they are often overrated, and that a standard system of rating would be desirable, which would convey a more comprehensive idea of the capacity of the motor and form a basis for comparison. It is no doubt true that the horse-powers of many of the motors in use are rated, not by how much work they are capable of doing, but by how much work it is considered they ought to do. The rated, or, rather, the advertised, power of a motor depends, therefore, to some extent on the designer, as well as on the motor, a sort of personal factor being introduced. This, however, may not be done with any intention of misrepresenting the capacity of the vehicle, but purely through ignorance of the actual or possible horse-power of the engine employed. In any case, the question is one of great importance to both builders and users of motor-cars, to whom we recommend a careful perusal of the article on the subject we publish on another page of the present issue. As is mentioned therein, it is greatly to be desired that some way should be found of reducing the present confusion and want of system with regard to the horse-power ratings of petrol motors. To this end a suggestion is made on which we shall be glad to receive the opinions of readers.

Police Traps.

THE value of the information given in our columns week by week with regard to police traps, and also to the activity of the local authorities in inciting the police to harass motorists, is recognised far and wide. Often have our intimations enabled motorists to know where to crawl along the country side or to avoid roads likely to prove expensive. The police do not appreciate the publicity thus given to their methods, but we regard our policy as of the greatest utility to our readers. At the

West London Police Court, the other day, Mr. Plowden admitted that by the traps laid by the police for unwary motorists the latter were placed in overwhelming difficulties, but the magistrate, unless he held that the police were acting in bad faith, was bound to convict. This may be the magisterial view of the matter, but we should have thought that the duty of the police was to make easy the path of the innocent user of the road and not to seek every means to encompass his downfall.

A Challenge in Court.

WEEK-END motorists should beware of the police, for Saturdays and Sundays are the days most prolific in their activity. On a recent Saturday the police of Keighley laid a trap on the Skipton Road, between Keighley and Steeton, and caught half-a-dozen motorists, who have since been required to give £4 to the county fund. One of the drivers stated that with the gear set at the fifteen miles an hour speed it would be impossible to get that speed out of the car on a level road. The magistrates said that owing to the conflict of evidence they were willing to try the car over the same course with an expert driver, and the gear set at fifteen miles an hour. If the result showed that over fifteen miles an hour could be obtained then they would have to convict. The defendant urged that the valve must be partly closed, but the presiding alderman pointed out that the driver said that it was impossible to get fifteen miles an hour out of the car on the level road with the machinery set. He said nothing about the valve. "Then I do not agree to the test," retorted the defendant, who at once submitted to the fine.

The Reliability Trials.

MOTORISTS are now looking forward to the Reliability Trials of the A.C.G.B.I., and Mr. Basil Joy, as Technical Secretary of that organisation, is busy arranging the details. In order that the event shall not clash with important military and scientific meetings in September it has been decided to postpone the trials to September 18th, and the closing dates for entries have also been advanced a fortnight. More than a hundred entries have already been received, and we hope that the good weather which followed the recent Irish tour will not forsake the Club on the occasion of its forthcoming Trials. A new class known as Class A1 will be instituted, and all machines exceeding the 170 lbs. weight limit, such as tandems and quadricycles and similar two-seated vehicles, will be eligible for this section.

Heavy Traffic.

AT the Health Congress held at Liverpool, Mr. G. F. Deacon, President of the Engineering Section, was unable to take the chair in his department, and Professor H. S. Hele-Shaw was called upon to preside. The introduction of self-propelled vehicles had, he said, raised in an acute form the whole question of speed of traction upon the public road. The majority of people regarded the speed of the horse lorry as the natural rate of progress of merchandise on the highway, and hence the congestion, which was a standing disgrace to London and in less

degree of other cities. Take, for instance, the crawling stream of heavily laden or empty lorries along Liverpool's magnificent system of docks. Few people gave a thought to the millions in time and money which might be saved if the rate of progress of dock traffic were even doubled, and the length of space taken up by a team of horses and lorry were reduced to one half, so that the volume of trade on the roads could be accelerated, and, if necessary, quadrupled.

Decorated Motor-Cars.

At a cycle parade in aid of the Northampton General Hospital, Mr. H. W. Dover's Lanchester car attained distinction. His motor-car had been completely transformed, and it presented a good idea of a house-boat from Henley Regatta. At a little distance the illusion was complete, for the sides of the "boat" were worked out most cleverly, while at front and back there was a very fine show of flowering plants, and the "deck," covered with the generally necessary awning, was artistically decorated with natural flowers. There were passengers, five of them, including the ladies up aloft; and their progress was marked by the music of the mandoline and sweet singing. The representation was, to Northampton, novel in idea, and carried out with artistic perception and taste. Mr. W. B. Stevens, who drove the only other car in the competition, had a floral car, delightfully wreathed and festooned.

A Hint to Motor Owners.

MAJOR LEE, M.P., who is a motorist as well as the President of the Hampshire Farmers' Club, has been addressing the members of the latter at Fareham, on the motor-car question. He rightly said that legislation should not seek to destroy a growing and useful industry, and ventured on the prediction that within the next decade the whole of the ordinary operations in agriculture now performed by heavy horses would be executed by motors. At the same time he condemned the drivers, including foreign professional drivers employed by English gentlemen, who are somewhat prone to drive motor-cars in what appears to the on-looker a somewhat reckless way. This sort of thing must be checked, and much good would be done by private owners not only instructing their drivers to have regard for other users of the road, but seeing personally that such instructions are obeyed.

Capt. Noble's View.

OUR list of furious driving cases is representative of most English counties, and again the southern roads appear to have become almost impossible for motorists. The Uckfield Bench of magistrates is a very estimable body, presided over by Captain Noble, who appears, however, to have a horror of motor-cars. In imposing an inclusive fine of £1 the other day, the gallant Captain said that had he to decide the case himself, the offending motorist would not have got off so easily. The Uckfield Bench may therefore be congratulated on the fact that all its members are not so intolerant as the gentleman who presides over them. When a quartette of cases was recently brought before him, Capt. Noble drew a graphic picture of the terrors of village life which had become ordinary and commonplace since the advent of the automobile. According to him, people have now to clamber on to the banks, and horses have to go into ditches to get out of the way of motorists. The performance of such acrobatic feats betokens a high order of intelligence in the equines as well as in the human individuals. Surely this aspect of the matter should appear to so military a person as the president of the Uckfield magistrates.

Under Canvas.

THE success of the Yorkshire Club's camping expedition in Ireland, coupled with equal popularity gained by other arrangements under canvas during the Gordon Bennett week, is probably one of the factors which have led the Yorkshire Club to arrange for a motor camp during the early days of next month. This will be located on the coast between Bridlington and Scarborough, and there, from July 31st to August 5th, will be the headquarters of the Yorkshire motorists. A large dining-room, drawing-room, kitchen, and motor-car store are to be erected, and bell tents provided for sleeping accommodation. During the week end a gymkhana will take place, and runs and tours will be arranged to various places of interest in the attractive locality. We understand that the field occupied will run quite close up to the cliffs, and should the weather be favourable—and a great deal depends on this point—the first organised motor camp in this country should be greatly enjoyed by all who participate therein.

Yorkshire Opposition.

WE would suggest to the Yorkshire Club that they should invite some members of the West Riding and Yorkshire County Council to their camp between Bridlington and Scarborough for the purpose of education in automobile matters. Inspired by the eloquence of the chairman, Alderman C. Milnes Gaskell, the Council has appointed a special committee to secure amendments to the Motor-Car Bill, and that these are likely to be hostile may be inferred from the speech of the worthy Alderman. He denounced the abolition of the speed limit and described the pains and penalties to be imposed should the Bill become law as a "perfect farce." More than that, the proposals of the Government were "the most supremely futile and ridiculous ever suggested to the country."

Motor-Car Tours.

ONE of the best features, from the tourists' point of view, in their Majesties' visit to Ireland will be the motor-car trip the King and Queen propose to make in some of the western districts, which, unfortunately, were not visited by many motorists during the recent automobile fortnight in the Emerald Isle. The King is making increasing use of his motor-car even in town work, and now very frequently drives from the London Railway termini to Buckingham Palace in one of his automobiles. The Prince and Princess of Wales, too, who are touring in Cornwall, have availed themselves of the motor-car for many drives in that county, and the fact is becoming increasingly apparent that fashionable Society will make less use of the railway in the

future than in the immediate past for holiday tours. The view of the country obtainable on the automobile is practically unlimited, and this is one of the factors which is conducive to the universal popularity of the motor-car.

Royalty in the West.

WITH reference to the Prince of Wales and his Cornish tour, one of the most interesting trips was by motor-car, on Saturday, from Tregothnan by way of Helston and Mullion to Poldhu, and thence to the Lizard. Rains on the previous day had laid the dust, and the roads were consequently in good condition for touring. Crossing the Fal to Old Kea in a six-oared gig, the Prince and Princess were welcomed by Mr. J. Retallack, the Surveyor to the Truro District Council, who expressed the hope that the roads of the locality had been found in good condition. His Royal Highness replied that he had never driven over better roads, no loose stones being left to do damage to motor-car tyres. Lord Falmouth joined in the views of the Prince, and the surveyor was asked to convey the Royal appreciation of Cornish roads to the District Council. Two motor-cars—one belonging to the Prince, and the other to Lord

an ordinary horse-drawn carriage. The driver's seat is low, so that the occupants of the carriage have a good view through the glass panel at the front. Solid tyres have been fitted, and there is a detachable luggage basket on the roof.

Bad Conduct Condemned.

QUITE recently, half a dozen cases have occurred where drivers have not only shown a total disregard of the ordinary courtesy of the road, but have been guilty of actions likely to bring the whole of the automobile movement into disrepute. We sympathise most thoroughly with the Hon. Sidney Holland, the chairman of the Poplar Hospital, who has made public reference to a case in which a pedestrian was alleged to have been knocked down at Dagenham by a motorist who hurried along, never stopping to inquire whether the poor fellow was hurt or not. Mr. Holland is anxious to bring the driver to justice, and all reasonable motorists will agree in the hope that such an escapade shall not be allowed to go unpunished. Such incidents as these are well calculated to bring discredit on the whole body of motorists, and it is a duty which individuals

The London Fire Brigade's 10 h.p. Wolseley arranged as First-Aid Fire Engine.

Falmouth—conveyed the party to Marconi's telegraphy station at Poldhu. The Prince and Princess, Lord and Lady Falmouth and Bishop Corfe were in the first car, and the second was occupied by Lady Mary Lygon, Lord Grenfell, the Hon. Derek Keppel, and Mr. F. B. Mildmay, M.P. Sir Arthur Bigge, Lord Falmouth's two sons, and Mr. Marconi motored direct to Poldhu in the latter's car, from Tregothnan.

New Royal Car.

ON Wednesday the Royal visitors motored to Lydford, the car having been taken over the chosen route on Tuesday. The road is a winding one, and there being so many stiff hills to encounter, it was deemed advisable to test its capability. Great excitement has prevailed throughout the west, coaches lining the route taken in many places, and the popularity of the motor-car in the west of England will be greatly enhanced by the preference shown by Royalty. On Thursday an electric brougham for town use was delivered to the Prince of Wales by the City and Suburban Electric Carriage Company. This carriage is a four-seated brougham, the body of which hangs specially low, and the batteries are skilfully concealed within the lines of

owe to the movement to assist in bringing such unfeeling persons to justice.

Motor Traffic and Main Roads.

THE ever-increasing motor-car traffic through Northamptonshire, which is on the main road from the Midlands to London, has led the Northamptonshire surveyor (Mr. C. S. Morris), to make special reference to the matter in his annual report. He says that "it certainly appears that ere long some additional provision will be required in the county to protect the local public more from the dangers of motor traffic. What form this should take—whether by widening the existing carriage-ways or providing a separate track for fast motor traffic, is a matter which will require further consideration. The majority of the main roads in this county (with the exception of a few village districts) would lend themselves admirably to either scheme, there being very wide grass margins on each side. The metalled portion of the roads ought to be gradually widened, and as there is a good supply of slag to be obtained at a reasonable price, the improvement could be cheaply effected." Such is the suggestion of a practical man; whether his Council will adopt the idea remains to be seen.

The Motor-Car Bill.

ON Tuesday the Government's Motor-Car Bill was reported to the House of Lords after a long and earnest discussion. The new points introduced into the measure included the limitation of the obligation of a local authority to grant licences to persons residing within the area of their jurisdiction; the annual renewal of licences; the right of appeal to quarter sessions on the part of those whose licences are suspended, and the reduction of the speed limit in towns and villages to ten miles an hour. Lord Balfour has also promised to adopt a provision rendering it necessary for motorists to stop and give names and addresses when their cars are the cause of accidents.

Certificates of Proficiency.

DESPITE the advocacy of Lord Rosebery and the Earl of Rosslyn, the Government were firm in opposing the granting of certificates of competency, and in this they had the support of the House. As Earl Russell pointed out, owners of costly cars are not likely to risk valuable property with incompetent men, while a certificate of proficiency in driving cars would be no safeguard to the public. Such certificates would be really worthless to the average man, and we do not share Lord Rosebery's alarm that "under the settled policy of the Government there might be next year 20,000 of these powerful machines in use on our roads without any guarantee of efficiency being provided except the competency of the driver to pay a shilling." It is the spirit of recklessness or carelessness that constitutes the real danger to be provided against.

Ten Miles through Towns.

THERE is much to be said in favour of uniformity throughout the country, and the decision of the President of the Local Government Board to institute a speed limit of ten miles an hour for cars passing through towns should do much to assuage the wrath of anti-motorists in some parts of the country. But if this is to become law it will be absolutely necessary that the local authorities shall be compelled to give adequate notification on the lines previously advocated in our columns as to the area of limited speed. Lord Balfour's assurance on this point was very satisfactory. He said, "A danger to be guarded against was the undue caprice of local authorities. They could not be allowed a roving charter to impose limits wherever they liked, but must be under the controlling authority of the Local Government Board. It was absolutely necessary that notices should be posted up wherever a special speed limit was prescribed. Between the two notices posted up, the driver was not to go beyond the special limit of speed."

Agriculturists want a Speed Limit.

AT the meeting of the Council of the Central Chamber of Agriculture on Tuesday a motion was brought forward that the present speed limit for motor-cars should not be altered. The Earl of Warwick, who presided, interposed with the comment that as he and other members of that council often drove their horses at fourteen and sixteen miles an hour, it would be foolish to carry that resolution. They would be much more likely to get what they wanted if they were reasonable. The meeting divided on the motion, and it was defeated by the chairman's casting vote. The original motion, asking for a generally-defined maximum speed limit, was the only resolution carried by the meeting.

The Views of County Councils.

ON Wednesday the executive council of the County Councils' Association met at Westminster, under the presidency of Sir John Hibbert, to discuss resolutions on the Motor-Car Bill. The meeting approved of the general principles of the Bill, and made the following suggestions:—That there should

be a clear discrimination between the different classes of offences and of the penalties inflicted. That if any person who is aware that an accident has been caused by him attempts to escape without giving his name and address, this should be made a separate offence under the Act. That officers and other persons employed by the different Government Departments should not be exempted from the operations of the Act. That the licence fee should be raised from 1s. to 5s. They further suggest that furious driving should be made an offence, and that a police-constable who received intimation by telephone or telegraph should be able to apprehend the offender without having seen the offence committed.

Prompt Opposition Necessary.

SEEING the influence of the County Councils' Association in Parliament, motorists must be prompt and active in educating M.P.'s to realise the hardships that some of the suggested provisions would cause. That a policeman should be allowed to apprehend a motorist "without having seen the offence committed" is likely to lead to serious abuse. Even now the taking of names and addresses by policemen at a distance from the place of the offence leads to mistakes, and serious injustice would often follow such an innovation in the law. We look to the motorists in the Commons to oppose such objectionable amendments to the Bill.

Affiliation with the A.C.G.B.I.

At a meeting of the Sheffield and District Automobile Club on Tuesday it was decided not to affiliate with the A.C.G.B.I., and that resolution will probably strengthen the movement for independence that is growing among the leaders of automobilism in the provinces. In fact, a conference of provincial clubs to consider the terms of affiliation with the London club has been suggested by the Lincolnshire association, and this will probably take place in September or October. London, Crewe, Sheffield, and Leeds have been suggested as convenient towns in which to hold the meeting, and Leeds or London will probably find most favour. We believe the Eastern Counties and the Manchester Clubs are in sympathy with the Lincolnshire Club in the matter, and that the Norfolk and Midland Clubs will attend the conference. The decision of the Sheffield body will strengthen the movement, from which only the Scottish, Yorkshire, and Nottingham Clubs are likely, from present indications, to hold aloof.

AMONG the wedding presents to the bride of Captain Norton, M.P., was an electric landau.

THE Prince and Princess of Wales have this week motored to Princetown and over Dartmoor.

WE learn that the police are likely to be active at Crawley on Sunday, a trap being in contemplation near the Sun Inn.

MR. W. J. MILLS, of the White Hart Hotel, Margate, has two motor garages and facilities for the repair of cars.

THE War Office has just ordered two 24-h.p. petrol lorries from Stirling's Motor Carriages, Limited, to carry loads of three tons.

THE motor 'bus service at Eastbourne has been so successful that its early extension has been decided upon by the local authorities.

THE handbook issued by the Wolseley Tool and Motor-Car Co., Ltd., is a most useful *vade mecum* to users of Wolseley cars. A useful section is that devoted to the cleaning of motor cars, some extracts from which were given in our "Useful Notes" last week.

CORRESPONDENCE has been passing between the Dunlop and the Collier tyre companies with reference to the tyres used by the English competitors in the Gordon Bennett race. Owing to pressure on our space and the time the letters were received we are unable to publish them in the present issue.

REFLECTIONS ON THE IRISH AUTOMOBILE TOUR.

NOW that the last of the motorists who in gallant numbers invaded Ireland a month ago has returned from the Emerald Isle, some reflections on the event which so greatly stirred the country are opportune and necessary. On this side of the Irish Sea we shall shortly be concerned with the annual trials associated with automobilism, so that this early opportunity must be taken of recording some general impressions. The great race has already been fully discussed; our comments on the present occasion will be limited to the tour and trials which followed the race. In some respects these invite comparison with the 1,000 miles trial of 1900. Firstly, the distance traversed, according to the official programme, together with the runs from Dublin to the Gordon Bennett course and from Belfast or Newcastle to Castlewellan, and including a jaunt along the Prince of Wales' route at Killarney, was about the same. In 1900 the participat-

go—a dreary unevenness characterises the roads that is decidedly irksome in connection with travel. One result of the tour should be to arouse the local authorities to a sense of their duty in providing decent highways as well as tolerable bye-ways for the encouragement of motor travel in a land where the peasantry welcome strangers and recognise in motorists' substantial gains to the revenue of the country. Away in the south east of Ireland we learned how the jealousies of two local bodies had led to a length of road being neglected to such an extent that it is positively dangerous to passing traffic. Such a state of things would not be tolerated in England, and should be impossible in Ireland. Kerry, Kilkenny, Cork, have earned undesirable notoriety, and a contingent of motorists going from Dungarvan to Cork experienced more punctures in the course of that journey than anywhere else in Ireland. Now that the beauty spots of the island have obtained new publicity among the touring public it is a good time for the authorities of the counties we have named to put their roads in order.

A word must be said as to the culverts that rise almost imperceptibly on the road surfaces, and, should the car happen to

Baron de Caters on his 60-h.p. Mercedes.

[L'Automobile Illustrée.]

ing cars were mostly entered by manufacturers who naturally included their best vehicles in the trial; the Irish tour contained comparatively few "makers' vehicles, the large majority being privately-owned cars whose passengers were on pleasure bent. The way in which they behaved was a tribute to the advance made by the industry since the first organised trial in this country, and must have been a revelation to the public as to the reliability of the modern automobile. There were few break-downs, the minor mishaps were unimportant, and the small proportion of stoppages to miles travelled must have surprised the natives.

Of the purely Irish aspects of the tour the spoliation of tourists by some of the hotel-proprietors and the abominable character of the roads in county Cork are impressions that will not lightly fade from the minds of the motorists who suffered from the first and who had the misfortune to travel over the latter. In the neighbourhood of Dublin and along some of the stretches further north the surface of the roads was really good; but outside a radius of twenty miles from the port on the Liffey—the dullard stream that never enters into any scheme of spring cleaning that city may under-

be going at a fair pace, cause the passengers to be elevated from their seats and deposited again in an unceremonious manner. Such antiquated excrescences should be made the subject of study by the road authorities, and, just as their acuteness was minimised along the Gordon Bennett course, so it should be lessened elsewhere throughout Ireland.

Great are the difficulties of tourists in Ireland as to finding the way. In county Wicklow the main roads are well-defined, although we remember how the want of signposts led us into the grey town of Wicklow instead of the grander region of Glendalough. Again, after leaving Waterford, a run to Lismore was ended, for the day at least, at Dungarvan, no cheery signposts directing the attention of wayfarers to the correct road. And then, too, between Lismore and Cork, the road is little more than a widened pathway, a deceptive looking highway that causes tourists to wonder as to whether they are on the right track or not. The provision of signboards would not be an expensive matter for the localities concerned; it would greatly conduce to the convenience of the Irish people and add to the enjoyment of tour-

ing by strangers. According to one artist the motorist's only guide in travelling by road is by following the trail of mangled poultry as depicted on the next page.

Hotel keepers in some places have given motorists a very poor opinion of the hospitality of Ireland. Great improvement has undoubtedly been made during recent years in the character of the accommodation provided for visitors; but on occasions such as the recent automobile tour the proprietors of not a few were prone to regard motorists as geese to be plucked. Miles from anywhere and with no possibility of reaching a large town the same evening, several drivers have had occasion to denounce the exorbitant charges made by hotel people these

The Scene at the Shelbourne Hotel, Dublin.

last few weeks. We would reassure readers, however, on this point in normal times. Ordinarily motorists are welcomed with moderately-priced hospitality, and for the sake of Ireland it is to be hoped that the wanton way in which bills have been made out of late is not to be regarded as any indication of the usual condition of things. Still, the imposition has been of such a character that it could hardly be expected to go without a protest—and a warning to the Irish people never again to wreck their hopes of return guests by such extravagant notions of the pocket capacity of other people.

Ballyshannon House on the Day of the Race.

There is another matter in connection with automobilism that we are glad to see is exercising the minds of some Irish members. Several months ago we suggested to the Irish Department of Agriculture and Technical Instruction that it should consider the manufacture of alcohol from Irish grown products, and a reply was received which showed that the Department was sympathetic. Mr. Boland, M.P. for South Kerry, has revived the idea in a question to the Chief Secretary for Ireland, who has just informed the honourable member that the matter is still exercising the minds of the heads of the Department concerned. We would like to see the matter further advanced and

to hear that the Department was carrying out some practical experiments. In France alcohol is being employed in increasing volume in connection with motor-cars, and there is no doubt that if Ireland could produce alcohol for this purpose the makers of motor-cars in this country would quickly adapt their carburettors to meet the requirements of the spirit. This is an aspect of the subject that has not been greatly considered in Ireland during the tour, but now that prominent attention has been given it, we hope that the leading journalists and public men of the Emerald Isle will not allow it to be forgotten.

And now there is one other point with which we would conclude our impressions. The tour demonstrated—or rather reiterated—a lesson that has been frequently given of late, viz., that motor-cars can be driven at a high rate of speed along our highways without endangering the lives of the public. For three weeks motorists in Ireland enjoyed a practical abolition of the speed limit, and, with nearly a thousand cars rushing about on roads unfamiliar to most of their drivers, no accidents of anything more than the mildest character occurred. This must be regarded as a justification of the motor-car.

HILL-CLIMBING AT KERRY.

From the Phoenix Park, at Dublin, to the Killorglin Hills was a long way, and the close of the competition in connec-

View of the Hill between Killarney and Tralee, on which the Hill-climbing Contest took place.

tion with the Irish Automobile Fortnight, which took place on Wednesday of last week, was tame indeed. The course was on the Killarney-Tralee road, starting from Ballyfinane and finishing half-way up a steep ascent in the direction of the town of Tralee. Originally it had been intended to have allowed the cars a journey of 3,200 yards, as shown by the contour on another page taken from the "Club Journal," but, as at Castlewella, the distance was shortened, and the portion of road selected only measured 1,200 yards. There was a fair attendance of visitors, whose pleasure was marred by rain ere the event was concluded. Of the twenty-eight entrants for the contest for the cup given by the Kerry County Council only eight appeared at the start, and, as announced in last week's *Journal*, the cup was won by the Hon. C. S. Rolls, the times of the various competitors being as follows:—

Mr. J. W. Cross, 20-h.p. Humber; handicap, 25 secs.; time, 1 min. 33.5 secs.

Mr. George Iden, 20-h.p. M.C.C.; handicap, 32 secs.; time, 1 min. 42 secs.

Mr. J. M. Gorham, 22-h.p. Daimler; handicap, 35 secs.; time 2 mins. 8.5 secs.

P. G. Garrard Sir A. J. Macdonald's 22-h.p. Daimler; handicap, 45 secs.; time, 1 min. 40 secs.

Mr. Wilson, Elswick ; handicap, 28 secs. ; time, 2 mins. 7 secs.
Mr. W. J. Warren, 6-h.p. Gardner-Serpollet ; handicap, 5 secs. ; time, 2 mins. 10 3-5 secs.
Mr. R. W. Leader, 16-h.p. Century ; handicap, 40 secs. ; time, 2 mins. 11 1-5 secs.
Mr. C. W. Hacking, 20 h.p. Panhard ; handicap, 30 secs. ; time, 2 mins. 29 1-5 secs.

The Hon. C. S. Rolls, 80-h.p. Mors ; scratch ; time, 1 min. 5 secs.

The first and second in the handicap, the Hon. C. S. Rolls and Mr. J. W. Cross, were to contest the final, but in the meantime Mr. Cross's machine was disabled, and he did not go over the course again. Therefore, Mr. Rolls and the third man in the handicap, P. G. Garrard (driving Sir A. J. Macdonald's

Rolls, Phillips, Sturmev, and Siddeley, but the attendance of motorists was not large.

RIGHT through the tour the behaviour of drivers of horses was noticeable ; the majority appeared to be nervous on the approach of a car. In almost every instance drivers jumped from their carts and held their horses' heads in a very hearty fashion. The danger of such proceedings was illustrated near Cashel on Saturday. Mr. H. Grubb, J.P., was going towards Cashel in his motor-car, and two boys named Dwyer were driving towards him with a young horse. On the car getting near, the horse became restive, and the driver got down and caught the horse by the head. Mr. Grubb at once stopped his car, and kept it stationary until the cart had gone some twelve yards. Then he set the machinery working, but immediately the horse became furious—so furious that he broke away, knocking down both lads, the cart going over one and injuring him internally. The other was also severely injured by his fall against the road. Mr. Grubb took one of the boys in his car to the County Infirmary at Cashel, the other, who was lying on the road, not being in a fit state for removal. On arriving in Cashel, Mr. Grubb called at the police barracks and reported the occurrence, and then brought out Acting-Sergeant Cawley and Dr. Russell. Both of the injured boys are progressing favourably.

Profile Hill between Killarney and Tralee.

Daimler), were pitted against each other. The result was that Mr. Rolls carried off the Kerry Cup in fine style, covering the course on his Mors in 1 min. 1 4-5 secs., Garrard's time being 1 min. 28 secs.

IRISH GOSSIP.

It will be remembered that the nasty corners on the Gordon Bennett course were oiled to keep down the dust. From a continental contemporary, we learn that the work was done by a German company known as the Deutsche Oelbesprengungswerke, of Berlin, which received a telegram from Count Sierstorpff congratulating them on the success of their system.

What Might Have Been—but Wasn't.

(Das Schnauferl, Munich.)

MR. R. J. MECREDY and Mr. J. C. Percy must be congratulated on their work, not only in connection with the recent contests, but also in giving valuable local assistance to the Club officials before the event, notably in the selection of the course.

THERE is no doubt that the tour was too lengthy for the average man, and the way in which several who had braved the roads to Cork rushed to Killarney instead of waiting for the motor-boat races at Queenstown was significant. Among the officials in connection with the local races we noticed Messrs.

Mr. L. P. Mooers on his Peerless Car.

LAST week we announced the inauguration of the motor-car service by the Earl of Leitrim in the north-west of Ireland. The vehicles, which are built by Stirling's Motor Carriages, Ltd., are fitted with 24-h.p. motors and have a maximum speed of 12 miles an hour. They provide comfortable accommodation for fifteen passengers and luggage. The route served is thirty-eight miles in length. Starting from Strabane, the road is taken to Letterkenny, thence via Milford, Mulroy, and Carrygart to Rosapenna with its well appointed hotel. The first run was made by the Earl and Countess of Leitrim, the time occupied, including stoppages, being just over four hours. Two coaches are already in service, and a third is nearing completion at the works.

PERCY OWEN, one of the American team in the Gordon Bennett race, is at present paying his first visit to France. He, like Alexander Winton, puts down the poor showing of the Winton cars in the Cup race to the inferior petroleum spirit available. In the course of an interview Owen made some strong comments on the subject, remarking that "either the English do not know how to refine American petrol or my compatriots sell them inferior products."

THE gradient of the hill at Castlewella was 1 in 9, and in the trial the 10-h.p. Duryea car went over the course without changing gear.

CONTINENTAL NOTES.

BY "AUTOMAN."

THE Ostend meeting has been quite a brilliant event, and has, in a considerable measure, compensated this watering place for the loss of attraction caused by the closing of the gaming tables. Tuesday, the 14th inst., was devoted to a reception, a banquet, a battle of flowers, and a competition for skill in driving. The reception and banquet were in honour of the Automobile Club du Nord, the organisers of a motor caravan from Lille to Ostend via Menin and Nieuport, over the new road which has been constructed on the initiative of the King of the Belgians. The French caravan was met by the Belgian contingent at Snaeskerke, and the combined squadron of seventy-two cars made their way to the Palace Hotel, where the reception

covered the whole course in the least time. Baron Piere de Crawhez won the contest. He did not make a single mistake, and covered the distance in the best time, thus obtaining the maximum of 110 marks. The day concluded with a battle of flowers on the marine promenade.

WEDNESDAY morning was taken up with a reception of the motoring visitors by King Leopold in his villa on the sea shore, and the presentation to the King of a gold medallion as a souvenir of the meeting. In the afternoon speed trials were held on the Snaeskerke road, the mile with a standing start falling to Rigolly on his Gobron-Brillié with four cylinders and eight pistons. His time was 58 4-5 seconds, whilst Baras on a light Darracq took the second place in the day's classification, and the first place in the light car class. A Darracq driven by Villemain won also the voiturette class. Stocks on his Napier took the fifth place in his

The Foreign Military Representatives in Motor Cars at the German Cavalry Manœuvres at Doberitz.

[Allgemeine Automobil Zeitung.]

and a banquet awaited them. There were upwards of 200 guests present, and, in the speeches which took place after lunch, unstinted praise was awarded to the King and also to the Belgian Minister of Public Works, on account of the magnificent road which has rendered Ostend accessible to French motorists.

AFTER the luncheon the driving contest took place at the Wellington Hippodrome before an audience of nearly 2,500 persons. The competition consisted of a drive between posts and over an earthen wall, with a momentary stop on the summit, and thence through innumerable barriers—fixed and moving—and underneath a ring which had to be seized and pulled in order to ring a bell, and over fog signals in the shape of balloons, exploded by the wheels passing over them, and finally through a maze on the reverse motion. Out of a possible one hundred, points were deducted for each mistake, and ten were added for the car that

class and the tenth place in the general classification, doing the mile in 1 minute 11 1-5 seconds.

THURSDAY was spent in a touring competition, and Friday was the great event—the flying kilometre on the Royal road. The weather was all that could be desired. At the spot chosen for the competition the road is very nearly level, but, if anything, slightly uphill. The success of the day fell easily to Rigolly, who, on his Gobron-Brillié, covered the kilometre in 26 1/4 seconds, beating the official record by 2 1/2 seconds. Baron Forrest's record of 26 3/4 seconds is not considered official, as the Phoenix Park kilometre was downhill. The second place also fell to a Gobron-Brillié in 28 3/4 seconds, followed by two Mors cars in 29 and 29 1/2 seconds respectively. Poege was fifth on a Mercedes in 31 1/2 seconds, and Stocks on his Napier was sixth in 31 3/4 seconds. Beconnais carried off the light car class on a Darracq in 30 1/4 seconds, and Baras (Darracq) took second place with 31 1/2 seconds.

THE Ostend meeting came to an end on Saturday with an exhibition of the cars; it was, however, marred by the rain, which came down in torrents.

THE Portuguese daily paper, "O Commercio do Porto," has a very special telegraph cable direct to Ireland, by a wireless system which has nothing in common with Marconi's. The invention is quite of another kind, as a persual of the following translation of one of its paragraphs will show:—

"London, July 3rd (by special telegram).

"In the Gordon Bennett automobile race, for a cup of honour of the same name, several accidents have taken place, due to the hostility of the Irish peasants, to the bad roads, and to the torrents of rain which fell during the race and rendered it dangerous. In this race 201 motors were entered or ran; half of them were North-American and the remainder English, French, Belgian and German. Great precautions had been taken lest the public should be injured. One automobile, driven by an American lady, daughter of a wealthy shipowner of Philadelphia, was upset and the young lady was bruised, but, fortunately, not seriously. It is thought that six drivers have been killed, and there are more than twenty injured. The winner is a German named Genatzi." As the French say, "Sans commentaire."

MAX RICHARD, one of the founders and a director of the

advised all automobilists to avoid the town and has given directions for passing round it. The campaign has been backed up by the public to such an extent that the tradespeople of the town are up in arms against the authorities, and have begun to harass the mayor with complaints that their trade is being injured. The result is that the mayor has been obliged to take steps to put a stop to this persecution, and a salutary lesson has been given to the police.

THE Berlin Automobile Club is organizing an excursion from Wannsee to Wittenberg and back (a total distance of about a hundred and fifty kilometres) to be undertaken in September next. This expedition is to be regarded in the light of a reliability trial rather than a race—the durability of the cars and their tyres on lengthy journeys being the main test and not the actual speed at which such journeys can be accomplished. Those answerable for this competition are convinced that it is only by such means that the public can hope to arrive at any trustworthy and independent opinion as to the merits of the different makers of cars.

SOME important cavalry manoeuvres were recently carried out at Doberitz, Germany, in the presence of the Kaiser and a number of English and Austrian military authorities. The illustration on page 408 is reproduced from a photograph of

Some of the Decorated Cars at the Flower Fete.

M. Salleron on his Mors Racer.

THE OSTEND AUTOMOBILE WEEK

firm of Georges Richard, of Paris, has been singled out by the French Government for the honour of the red ribbon, which is the badge by which the chevaliers of the Legion of Honour are known. M. Richard, who, with his brother Georges, who was injured in the Paris-Madrid race, has always been in the van of the automobile movement, is the President of the Chambre Syndicale de l'Automobile, and vice-president of the extra parliamentary commission.

THE idea of police traps has never taken root in France, for a very simple reason, the courts here have a simple way of treating automobile cases. There is no attempt at evidence, the fact of being summoned means a small fine and expenses. If there is any attempt at a defence the fine is increased; nothing but an alibi in case of a "flying summons" can save you. If, however, the police do not lay traps as in England, there are certain localities where some influential autophobe, either official or officious, stirs up the police to make a wholesale onslaught on unwary motorists. The most notorious place for this kind of persecution has been Saint-Germain, some 12 miles from Paris and on the main road to Rouen, Havre, Trouville, Dieppe, etc. Here hundreds of motorists have been summoned on every holiday, and in some cases most unjustly. For the last six weeks the "Auto" has taken up and carried on daily a boycotting campaign against St. Germain, and has

the foreign visitors and the cars which conveyed them to the practice ground. To the left is the Kaiser's Mercedes, in the centre a 12-h.p. Serpollet steam car, and to the right a 12-h.p. petrol car. In the centre of the picture are two of the British representatives, Lord Basing being to the right and Major Makins to the left, both being officers of the First Dragoons.

THE German Daimler Motoren Gesellschaft, of Cannstatt has notified the German Automobile Club of its willingness to build cars to defend the Gordon Bennett cup in 1904.

THE Automobile Club of Frankfort-am-Main is organising an automobile race meeting, to be held on the Oberforsthaus race-course on the 30th August. The course is one lap to the mile. The following programme has been prepared:—

Class I.—Motor-cycles. 3 laps. Open to all amateurs and professionals.

Class II.—(a) Light cars up to 10-h.p. 5 laps. Open to amateur drivers. Cars must be steered by respective owners. (b) Light cars up to 10-h.p. 5 laps. Open to professional drivers. Club handicap. Open to members of the Frankfort Motor Club only. 5 laps.

Class III.—(a) Cars up to 16-h.p. 8 laps. Open to amateurs. Driver must be owner of car. (b) Cars up to 16-h.p. 8 laps. Open to professionals.

Class IV.—Large cars up to 60-h.p. 10 laps. Open to amateurs. Drivers must be owners. (b) Large cars up to 60-h.p. 10 laps. Open to professionals.

THE HORSE-POWER OF PETROL MOTORS.

PERHAPS no subject in connection with petrol motors is in a state of greater chaos and confusion than that of their horse-power. The question of the power developed by internal combustion motors has always been a somewhat vexed one from the theoretical point of view, lacking that elegant correspondence with theory which the steam-engine affords; but as the practical application of the brake test offers no more difficulty in the one case than in the other, there is little excuse for the very wide discrepancies which attract our attention on perusing the various makers' catalogues. The adoption of some form of standard, if only a conventional and empirical one, which would enable the specifications of cars to be more easily comparable *inter se*, is certainly much to be desired, as may be realised from the accompanying table, showing the dimensions of a few well-known makes.

Car.	Nominal h.p.	Bore, mm.	Stroke, mm.	Number of Cylinders.	Total Capacity of Cylinders c. cm.	Revolutions (according to maker).	Capacity per nominal h.p.	Piston Displacement in litres per minute per h.p.

Average of Column 9, 173 litres per minute, per h.p.

One obvious cause of this want of uniformity is the fact that the modern light car has evolved—more or less simultaneously—from two different sources. The heavy car of a few years back was usually built with a slow-speed engine, and its h.p. catalogued on that basis, though capable of a considerably higher output if run at a higher speed. Then, as weights were cut down and powers went up, one type of light car developed from this source, but the tradition of cataloguing the engine under its maximum power remained. On the other hand, the evolution of the high-speed engine from its beginnings as a cycle motor was accompanied by the practice of listing its h.p. according to its maximum performance on the brake test, a performance not often reached in actual work; and the other type of light car, which owes its origin more or less directly to this source, often continues to be an example of the same practice.

Thus we have known much disappointment occasioned by changing from a low-powered two-cylindrical voiturette to a light single-cylinder car of nearly double the nominal h.p., though it must not be forgotten that there are other factors of equal importance regarding which the catalogues are even more contradictory, notably that of weight; the latter, however, can—

and should—be verified by even the most unmechanical purchaser, and the adoption of this course would soon render misrepresentation on that point useless.

It is otherwise with h.p., and the maker may plead with some plausibility that in the absence of any standard agreed upon he is, on the one hand, taking the only natural standard in quoting the maximum output of his engine, or that, on the other, he prefers to quote a power well within that it is capable of under adverse conditions, and that it is better for him that his car should, say, be called a good 10-h.p. than a poor 12-h.p. Moreover, in view of a certain bias in favour of low-speed engines as such that prevails with the public (on the not entirely justified fear of abnormal wear as the accompaniment of high speed), some engines are listed at a speed at which they could hardly give more than two-thirds of their nominal h.p. The result may be that they are run at nearly double this speed, with satisfaction to the driver, who thinks all the time he has a "moderate speed" engine.

It is therefore highly to be desired that the present confusion and want of system in this matter should be reduced to order, even if this can only be done by an arbitrary standard, and the subject is deserving of consideration by our automobile authorities. Obviously the arbitrary standard could be dispensed with by listing every engine at its maximum power by workshop test; this, however, would probably be less satisfactory to purchasers (who are in the habit of expecting a margin of power above that listed) than the adoption of an arbitrary standard somewhat after this manner. Let the maximum brake h.p. be taken; then let the b.h.p. at two-thirds or three-quarters of that speed be measured, this latter to be the nominal h.p. and speed. Thus the usual margin would be allowed, but it would be a definite and accepted one, and some uniformity in the classification of engines would be attained. It is needless to add that the establishment of such a system must depend on the initiative of the makers themselves.

The foregoing table, which, though incomplete, gives the dimensions, listed speeds, and h.p. of twenty-two types of cars well illustrates the present want of system. The listed speed was only available in fifteen cases, and the last column, which gives the piston displacement per minute per h.p., thus taking both size and speed of engine into account (and which, if halved, should approximately represent the volume of mixture burnt per minute), sufficiently indicates that this must be inaccurately listed in some of the cases given in the table. A formula proposed by M. Hospitalier, some year or two back, amounted approximately to the statement that 1-h.p. should be calculated for every 200 litres per minute of piston displacement; and this was then thought to be too favourable, and 250 litres suggested instead. Efficiency has undoubtedly improved since then, and the average of column 9 shows that 1-h.p. is claimed for 173 litres, most of the figures lying between 140 and 190. These variations, even omitting the four or five extreme ones, which are probably due to loose and incorrect speed assertions, are quite enough to show the necessity for introducing more system into this important subject.

TO-DAY (Saturday) the Kent Automobile Club will hold a picnic at Hothfield Common.

THE Southport speed trials, which were to have been held on the 24th and 25th of the present month, have been postponed until later in the year.

COMPLAINT reaches us that the proprietor of an hotel near Reigate has refused to accommodate a motor-car, or find room for motorists who were stranded in the locality recently.

THE Krieger Co., of Paris, is reported to be about to bring out a combination petrol-electric vehicle, the motive power being supplied by a 20-h.p. four-cylinder Richard-Brazier motor.

TO-DAY'S (Saturday) run of the Wolverhampton and District Automobile Club is to Stafford.

MOTOR-CYCLING NEWS.

LUBRICATION is one of the most important items in the successful working of an air-cooled motor. To avoid any failure in this respect, the Ormonde Motor Company claim to have surmounted this serious difficulty in their motor-bicycle in combining with an improved automatic adjustable lubricator an auxiliary reservoir in the form of a pump fixed upon the front part of the top tube of frame, in full view of the rider. This pump is fitted with a two-way cock. When turned to one side it communicates with the main oil reservoir, and to the other side with the engine, but when placed centrally it shuts off both engine and reservoir. This pump is not filled by the usual method of suction, but depends upon air pressure in the oil reservoir, which is obtained by giving the pump two or three strokes, thereby creating sufficient pressure to force the oil up. The oil is then fed to the crank chamber from this auxiliary reservoir or pump, through the automatic lubricator illustrated herewith. This latter ensures a gradual but constant supply of oil to the engine. The device, which is screwed into the crank case, depends for its feed upon the suction caused through the vacuum created in the crank-case by each upward stroke of the piston, and may be briefly described as follows:—1 is a valve, with its seating formed in the top part of 8; 2 is the spring holding the valve up (closed) to its seating. The bottom portion of 7 forms

the seating for the spring, and also acts as a guide to the valve stem; the top part carries the union, 5, to connect up with the auxiliary reservoir or pump; 3 is the connecting collar uniting the parts 7 and 8; this collar, or union, has a left-hand thread in the top half and a right-hand thread in the bottom half, so that by means of the hexagon in the centre this can be turned to expand or contract the two parts 7 and 8, thereby putting more or less tension upon the spring of the valve; the lock nuts, 4, secure the part 3 and form oil-tight joints, the part 6 being screwed into a shoulder to receive it in a convenient position upon side of crank-case. The feed can thus be easily regulated to the exact requirements of the engine without soiling the fingers.

HEREWITH we illustrate a new hook and eye fastening for twisted driving belts which has been introduced by Mr. Geo. H. Allison, of Station Road, East Boldon, R.S.O. It consists of a steel hook and eye which screw into two steel caps. The latter are

screwed on to the ends of the belt, and the screwing of the hook and eye into the caps has the effect of forcing the leather into the openings in the caps, and making a perfectly secure fastening. Should the belt stretch, it is an easy matter to unfasten the connection and give the belt a twist or two to take up the slack.

A RELIABILITY run from New York to Worcester, Mass., and back, was held on the 3rd, 4th, and 5th inst. by the New York Motor Cycle Club and the Metropole Cycling Club. Four-

teen of the thirty-two motor-cycle riders who started reached the last control inside the time limit, while two others arrived later in the evening. The feature of the run was the close race for the gold medal awarded to the contestant who finished with a perfect score and also adhered most closely to the fast schedule of fifteen miles an hour for each day's run. The weeding out was practically all done on the first day, thirteen of the starters failing to reach the night control in Springfield. On the second day only one rider dropped out; while on the last day's run a burst tyre and a broken frame caused two others to retire. The winner was George M. Hendee, of the Hendee Manufacturing Company, Springfield, Mass., who rode his 1½-h.p. Indian throughout the run without any trouble except a punctured tyre on the first stage of the trial on the first day. The machines of the other thirteen riders who finished consisted of a 1½-h.p. Indian, four 2½-h.p. Auto Bi's, a 2½-h.p. Merkel, a 2½-h.p. Marsh, four 2½-h.p. Columbias, and two 2½-h.p. Wagners. The vicissitudes of the successful riders were many and varied, tyre troubles delaying them, however, the most. The contest was a test of the rider as well as the machine, for though most of the 396 miles was run over very good macadam roads, there were many strips of road that were deep in sand, and others that were very rough and stony.

MUCH interest was centred on the race meeting at the Canning Town track on Saturday last by reason of the appearance of two French racing motor-cyclists. If, however, they proved somewhat disappointing, it was otherwise as regards the English riders, who succeeded in establishing some new records. H. Martin, on an "Excelsior," made new records from one to five miles. His one mile time was 1 min. 14 secs. against Chase's 1 min. 15 2-5th secs., and five miles were covered in 5 mins. 39 secs., or ten seconds inside record. Cissac, one of the French

Marius Thé, the French racer, on his 14-h.p. Motor Bicycle.

[La Locomotion.]

riders, attempted the ten miles record, but only did 11 mins. 38 secs., which is 6 3-5th secs. outside Crundall's time. A five miles handicap was won by H. Martin in 6 mins. 2 4-5th secs., Crundall being second and T. H. Tessier third. Marius Thé was unable to compete owing to his racer being unsuitable for the track.

COPENHAGEN motorists are up in arms against a regulation which has just been issued forbidding them to use their cars along the Standweigen, the favourite promenade in the Danish capital.

THE Perth District Road Committee of the Perthshire County Council would raise the speed limit for motor-cars to 20 to 25 miles an hour on a 20ft. wide road, "and certainly not more than 12 miles on roads from 12 to 20 ft. wide."

A New Type of Steam Wagon.

THE Londonderry Company have for the past thirty years built their own locomotives at the Seaham Harbour Engine Works, situated at Seaham Harbour, near Sunderland. Being thoroughly conversant with steam traction and quick to grasp the future of steam road traction, they turned their new works into a manufactory for this useful class of mechanism. Mr. S. J. Ditchfield and Mr. V. M. Corbett, chief agent to Lord Londonderry, added the necessary plant to the works and operations were commenced on 4-ton wagons to the design of the works manager, Mr. J. Donovan, and Mr. E. G. Allison, chief draughtsman. On the 11th inst. one of the first wagons was subjected to tests which conclusively proved that their 4-ton wagon is eminently qualified to carry its load economically under even extraordinary conditions. In the presence of a company of gentlemen interested in steam vehicles the wagon illustrated herewith was weighed and found to tare 2 tons 18 cwt. 3 qrs., and on being loaded was subjected to the following tests:—One hour full steaming on various gradients on ordinary country roads; a speed of seven miles was averaged throughout this run. The wagon then carried its load with ease up an incline of one in seven. The same incline was then run down at a speed of three miles per hour, and it was found that on steam being shut off and the brake applied the wagon could be stopped in its own length. A torsional test was then carried out by running the wagon with one main road wheel along railway sleepers laid along the roadway. Finally a test which can only be described as a general destruction test was negotiated. Six ordinary railway sleepers were laid at intervals across the roadway, and on the slow speed gear the wagon ran over the same without sustaining the slightest damage.

North country roads being proverbially hilly, the object of the designers has been to so construct the wagon that it might safely withstand the strains to which a vehicle is at times unexpectedly subject on country roads, and the tests successfully carried through prove the soundness of their design. Steam was easily maintained in the boiler, which is of the water-tube type, and a peculiarity of which is that the removal of the outer shell can be effected when necessary to clean out the whole of the water space of the boiler. The ash pan with bars can be

raised or lowered at the will of the driver, and at the test the fire was cleaned and relighted in the short space of $3\frac{1}{2}$ minutes. The severe strains during the tests were counteracted by the special arrangement of main axle and driving gear. The whole weight of the load and the driving gear connection is carried by axle boxes in which the main driving shaft revolves. These axle boxes are carried on spiral springs, and to ensure the teeth of the driving cogs meshing at all times, axle boxes are steadied in the cast steel side frames in a sliding surface cut at a radius struck from the centre of the second motion shaft. Perfect freedom of the driving axle is assured, and no amount of compression on the carrying springs can affect the perfect meshing of the teeth of the cog driving connections. The engine is of the two-cylinder high-pressure type, and the silencing box, through which the exhaust steam passes, is utilised as a feed-water heater, the water on the delivery side of the feed pump being raised to a temperature of upwards of 200 degrees before being delivered into the boiler. There are no eccentrics or reversing links to the engine, steam being admitted to the cylinders by a rotary valve driven direct from the crank shaft of the engine. The manipulating handles and steering gear are conveniently arranged so that the driver can carry out the general working of the wagon, including stoking, without moving from his seat.

The general design of the wagon has been provisionally patented, and it has already been found necessary to re-arrange and extend the present Seaham Harbour Engine Works in order to cope with the demand.

From the Touring Club Italiano, of Milan, comes a copy of the new "Guida Della Campania," recently issued. This Guide is on the same plan as those already published by the T.C.I., which are all intended as an up-to-date description of the highways of Italy, detailed in provinces. We feel sure that the work will prove very useful to those tourists who desire to visit this part of South Italy, the merits of which, from the point of view of historical interest and natural beauties, are not yet fully recognised.

HERE AND THERE.

AN automobile club has just been formed at Spa, Belgium.

ONE of the latest purchasers of "Lanchester" cars is the Marquis of Anglesey, who is at present touring in his car.

A PETROL motor fire engine has just been brought into use by the fire brigade at Budapest.

BARON BARRETO, of Ryburgh, Norfolk, has just received delivery of a new 10-h.p. Wolseley.

The Stirling Motor Bus for Irish Service (see page 407).

WHEN in Bournemouth, the other day we noticed that a motor-garage had been established in connection with the Grand Hotel.

THE IPSWICH MOTOR COMPANY have opened a motor-car show room and workshop in Princes Street, Ipswich.

A NEW weekly automobile paper is about to see the light in Paris. It is to be known as "l'Automobile," and will be edited by M. Gaston Sencier.

THE members of the Lincolnshire Automobile Club held a "meet" at Thonock Park, Gainsborough, the seat of Sir Hickman Bacon, Bart., on Thursday of last week.

A MOTOR-CAR service has recently been started in place of the old diligence between Cadiz and Algeciras, Spain. The vehicle leaves Cadiz on alternate days, and accomplishes the journey in twelve hours.

RECENT motor-car mishaps include one at Westerham, caused by the failure of the brake to act when ascending the steep hill, and another near the Cat and Fiddle, five miles from Buxton, the result of a burst tyre.

THE members of the Royal Commission on Locomotion and Transport in London have accepted an invitation from the Automobile Club to view some of the main road outlets from London on motor-cars provided by members of the Club on Thursday, the 30th inst.

THE Civil Service Motor and Cycle Agency, Limited, established fourteen years ago as the Civil Service Cycle Agency, have found the business in motor-cycles developing so rapidly that they have opened a garage at Featherstone Buildings, E.C., where the motor-cycle part of the business will in future be handled and motor-cars will also be sold.

ON another page we give an illustration of the special 10-h.p. car recently supplied by the Wolseley Company to the London Fire Brigade. It is to be used as a "first aid" fire engine, to be despatched to a fire immediately on a call being received. It is equipped with ladders, and carrying its own supply of water in a tank, can commence the extinction of the fire before the larger engines can connect up and begin pumping.

OWING to the keen watch now kept by the police on motor-cars in Hyde Park that great London space has seen comparatively few motor-cars of late.

THE Bordeaux Automobile Club is organising a twelve days' tour, starting on August 8. Cantal, Dauphine, Savoy, Geneva, Grenoble, Lyons and Clermont will be visited.

UPWARDS of six thousand licenses have been issued up-to-date by the Automobile License Bureau at Albany, U.S.A. Applications continue to pour in at the rate of 125 a day.

AMONG the local councils that have passed resolutions approving of the Pocklington Rural District Council's protest against the abolition of the speed limit are those of Selby, St. Germans, and Epsom. The Leyburn Council has ordered the letter from the Pocklington Council to lie on the table.

MOTOR-CARS will be included among the exhibits at the Royal Lancashire Agricultural Show, to be held in Manchester from the 30th inst. to August 3rd. Messrs. Joseph Cockshoot and Company, Limited, have arranged for a display of Stanley steam cars and Northern, Velox, Rex, and Clement petrol cars.

THE new automobile department which is about to be established by the Case School of Applied Science at Cleveland, U.S.A., will be well equipped. The Winton Motor Carriage Co. and the Baker Motor Vehicle Co. have each promised to give the school the complete machinery part of one of their automobiles for study.

THE value of the automobile for carrying mails over rural routes was demonstrated by a practical test at Union City, Ind., U.S.A., recently. In two hours the vehicle covered a distance of 28 miles and made 94 stops. With the ordinary horse-drawn vehicle it requires about seven horses to perform the same work.

AT the annual meet of the Columbus Automobile Club at Columbus, Ohio, U.S.A., on July 4th, Barney Oldfield broke all world's records on a circular track from one to ten miles. The time as announced for each mile was 56-2-5 sec., 59sec., 59 3-5 sec., 1 min., 59 3-5 sec., 59 3 5 sec., 1min. 1 sec., 1 min., 59 3 5 sec., 1 min. ; time for ten miles, 9 min. 54 4-5 sec.

MR. HOWARD BEADLE and Mr. E. T. Giles, who are shown on a M.M.C. car in the accompanying photograph, are identified with the Grosvenor Engineering Works, of Danvers Street, Paul-ton Square, Chelsea. The works are well adapted for the repair of motor-cars, being equipped with modern plant, an inspection pit, and manned with a staff of skilled mechanics who have

Messrs. Beadle and Giles on a 20-h.p. M.M.C. Car.

had much experience in automobile work. The firm also undertakes the carrying out of the ideas of inventors, and at the time of our visit a new gear was in course of preparation. To this we hope to return in a later issue; meanwhile we content ourselves with assuring our readers as to the extent and excellence of the Grosvenor Engineering Works.

It is reported that a syndicate has been formed in Paris to build White steam cars in France.

THE Southampton County Motor Club will hold a run to Wickham on the 29th inst.

THE chairman of the Brentford Bench has asked the local police inspector to be as civil as possible to motorists.

REPRODUCED herewith are two photographs of the latest type of 10-h.p. Argyll car fitted with combination honeycomb

[The 10-h.p. Argyll Car with Folding Canopy.

radiator and water tank. The vehicle is fitted with a folding hood which can be used as a canopy as above, as an ordinary hood, or as a dust-screen, the latter use being depicted below.

The 10-h.p. Argyll with Hood folded to act as Dust Screen.

THE Automobile Club of Berkshire, Mass., U.S.A., has issued a mandatory order warning its members against excessive speed on the public roads within the city limits of Pittsfield. A violation of the order will be punished by expulsion from the club.

THE American Association of Licensed Automobile Manufacturers is making arrangements to organise a technical convention of automobile designers and builders, to be held at Niagara Falls in the autumn.

MESSRS. JOHN CHILD MEREDITH, LTD., of Birmingham, inform us that they have now made arrangements to sell motor spirit in small quantities, their prices for smaller quantities than one gallon being 4d. per quart.

A BRADFORD motoring party were recently returning from the Lake District, when they ran over a hedgehog near Kirkby Lonsdale. Most of the animal's spikes are reported to have stuck in the tyre, which, as it was worn to its last canvas, was penetrated through the air-tube in several places. As to what actually happened to the hedgehog there is no record.

A 22-h.p. station omnibus is being built by the Daimler Company for the Duke of Bedford.

A MOTOR garage has been established at Rochester by Messrs. G. Senior and Co.

MESSRS. SPIERS AND POND have established a department for the hire of motor vehicles by the day or week. They are also giving instruction in driving.

THE London General Automobile Company, Limited, has been registered with a capital of £10,750 in 15,000 deferred shares of 1s. each and 10,000 preference shares of £1 each.

THE value of the exports of motor-cars and parts from the United States during May last only amounted to £28,854, as compared with £29,729 in the corresponding month of last year.

A NEW price list has been issued by Messrs. Alfred Dunhill, Ltd., whose motorities are well known to motorists throughout the British Isles. It extends to about 130 pages and embraces "everything but the motor."

MESSRS. EVERETT BROTHERS, LIMITED, has been registered with a capital of £500 to acquire the business carried on by Mr. E. Everett, as Everett Brothers, and to carry on the business of motor-car engineers, etc.

THE motor-cycle business of Mr. J. Van Hooydonk has been transferred to Phoenix Motors, Ltd., with himself and Mr. A. F. Ilsley as joint managing directors. Large works have been acquired at Blundell Street, Caledonian Road, N., to cope with the growing business.

THE Great Eastern Railway Company's Handbook, "Holiday in Eastern Counties," is issued in convenient pocket size, and prominence has been given to some less known districts in East Anglia. The illustrations have been made a special feature and motorists will find the country full of interesting and good roads.

ONE of the latest useful accessories brought out by Messrs. G. T. Riches and Company is a porcelain complete with the wire soldered in for repairing the latest pattern of

De Dion sparking plugs. The porcelain, with central wire, which is illustrated herewith, is supplied at a very low figure and should prove useful to those motorists who have a stock of damaged plugs.

THERE are now over 700 motor-cars in use in Pittsburg, U.S.A., of which 150 have been purchased this year. Physicians especially have adopted the motor vehicle, and it is estimated that fully three-fifths of the doctors in the city who formerly drove carriages are now using motor-cars.

M. A. DININ, of Paris, has established a depot at 9, Little James Street, London, W.C., under the management of Mr. Andre A. Godin, for the sale of the well-known Dinin ignition and traction accumulators. M. Godin, who is also agent for the Ducellier acetylene and paraffin lamps, has sent us a copy of a new catalogue he has just issued of these largely used light-givers.

FROM Mr. Theo Masui, of 1, Hanover Court, W., who has been appointed agent general for the Germain motor-cars in this country come two well-got-up lists—one devoted to the pleasure cars and one to heavy motor vehicles. The pleasure vehicles comprise five sizes, ranging from 7½-h.p. to 40-h.p., while the heavy cars range from a 7½ h.p. van to carry one ton, to a 20-h.p. lorry built for loads up to 6 tons.

IN regard to recent announcements that persons touring in Canada in motor-cars would be subject to a customs duty on their vehicles, the Canadian Department of Customs has announced that automobiles (not new) in use by tourists going temporarily into Canada and not domiciled in Canada may be passed upon deposit of an amount equal to the duty, subject to refund upon exportation within the time prescribed by the collector, not exceeding six months from date of arrival.

SOUTH AFRICAN NEWS.

[FROM OUR OWN CORRESPONDENT.]

CAPE TOWN, June 20th.

MESSRS. S. H. Adams and R. W. Early, representatives of the Rudge-Whitworth Cycle Co., Durban, have just performed a record run from Durban to Maritzburg on a Lanchester car. Starting from the Town Hall, Durban, at five minutes past eleven on Saturday morning, they reached Westville Hotel at 11.40, and from there completed the run to Pinetown in fifteen minutes, reaching Pinetown at 11.55. Killins was passed at 12.28, and, after a very rough climb past Botha's Hill, Inchanga was reached at 1.30, where the motorists made a brief halt for refreshments. Bent on establishing a record, however, the travellers soon resumed their journey, reaching Umlaas Road at 2.50. After passing Umlaas the run improved, the roads being in better condition than before. The run into Maritzburg was made in forty-seven minutes, the whole journey, therefore, occupying four hours thirty-two minutes.

A MOTOR 'BUS has started running between Cape-road terminus (Port Elizabeth) and Hunter's Retreat, a distance of eight miles. The vehicle, which is of 12-h.p., has seating capacity for sixteen persons, and is arranged to carry luggage up to 900 lb.

MR. D. P. GRAAF is equipping a very complete motor stable at the back of his house, "Bordeaux," at Sea Point, replete with every appliance which a mechanician could possibly require. Two pits are sunk into the floor and overhead blocks and tackle are fitted. Mr. Graaf has two cars, a 22-h.p. Daimler and a 12-h.p. Brush. Back of the stable, and in the same building, is a private 15-h.p. electric light plant. A neat charging board is fitted up in the engine room, for charging accumulators.

I UNDERSTAND from Mr. Bush, Mr. Abe Bailey's driver, that a City and Suburban electric brougham is on order for Mr. Bailey. It is notable that Drs. Jameson and Smart are using Mr. Bailey's 22-h.p. Daimler in travelling about the Colony on a political campaign.

WITH regard to that much-debated question, the speed limit it may not come amiss to make a few remarks with regard to the state of affairs in Cape Town. In the city and the suburbs the motor-car is restricted to the ridiculous limit of 8 m.p.h., while other vehicles travel at twice that speed and more without let or hindrance from the police. And it may be stated here, in all fairness to the police, that they themselves have no wish to fall foul of motorists at all, but they have strict instructions to arrest anyone whom they think is travelling above the limit, not to take any names and addresses, but to take them straight away to the police station. I hope to soon see the speed limit removed entirely and some system of registration instituted which will lead to the conviction of real offenders.

MR. NEWMARK, of Cape Town, has purchased a 10-h.p. German Daimler lorry for the conveyance of goods from Cape Town to Stellenbosch. Mr. Newmark was taken for a trial trip on the vehicle the other day, and pronounced himself as eminently satisfied with its behaviour.

THE Pontefract Corporation has held a special meeting, to consider a resolution of a committee that the property whereon Mr. Robert Ewbank is erecting motor works, at the junction of the Wakefield, Weeland, and the Doncaster and Leeds turnpike, be purchased for £450, for road improvements.

GOOD progress has been made at Torquay with the arrangements for the introduction of the motor omnibus service next month. It is intended that the first 'bus shall run from the Strand to Torquay Railway Station and beyond to Chelston Square. Other vehicles to be put in service later will connect Tor, Babbacombe, and St. Marychurch with the centre of the town.

SOME USEFUL NOTES.

WITH regard to the straining of petrol, when pouring the same into the tank, a correspondent writes:—"I have had excellent results for the past four years by simply placing a piece of ordinary muslin across the mouth of the funnel when filling, and have found that not only are any impurities kept back, but that absolutely no water will go through with the petrol, as it stays in the bag formed by the muslin and can be thrown out after filling the tank. I have a storage petrol tank buried in the ground, from which I pump out what I require. I frequently have first to pour a little water into my pump in order to make it suck. This water, of course, goes in with the petrol, and if it was not effectively separated from same it would prove disastrous to the running of the engine. I have, however, never been able to detect any sign of water in my tank after using the simple method mentioned above."

MESSRS. BROWN BROS. have just brought out a useful little accessory in the shape of what they term an unbreakable densimeter. The float and receptacle being made entirely of metal, there is no glass that can be broken, while the device is of such a size that it can be carried either by motorists or motor-

cyclists. To prevent rattling the float is carried within the case in felt packing. To use the densimeter it is only necessary to fill the outer case with petrol and insert the float. The latter is graduated from .670 to .725.

IN the course of a paper recently read before the French Society of Civil Engineers, M. Jules Garnier described a method by which he repaired the jacket of his petrol motor, the cooling water in which froze and cracked the outside casing. The author stated that he had cemented wide cracks with a composition of sulphur, iron filings and sal ammoniac. In the present case, however, the crack was too small to allow the introduction of anything but a liquid, which led to the idea of utilizing the property which the copper salts have of depositing metallic copper when brought in contact with metallic iron. The cylinders, the jackets of which each had two openings for the circulation of the water, were placed vertically over a zinc basin, the lower openings were closed by a cork and the jacket filled with a slightly concentrated solution of sulphate of copper, through the upper opening. The solution leaked out rapidly through the cracks, collecting in the basin, from whence it was poured back into the jacket. The leakage was rapidly reduced to a mere sweating, so that it was sufficient to pour it back every hour. At the end of the day air was pumped into the jacket, giving considerable pressure on the liquid. This slightly increased the sweating, but as the extruded liquid was nearly colourless instead of being blue, it was obvious that the operation was nearly complete, and on the next day the cracks were perfectly tight and the cylinders were mounted and once more brought into use.

THE chairman of the London Improved Cab Company, Limited, has expressed the willingness of that concern to adopt a motor cab should a satisfactory type of vehicle be submitted

CORRESPONDENCE.

PROTECTED SPARKING PLUGS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad if you would allow me to point out that the Schiele Protected Plug, illustrated in your last issue, is an infringement of my patents. I enclose you an illustration of my plug which has been put on the market by the General Electric Company. This invention consists in applying a cover or shield of an insulating substance capable of standing great heat—called ambroin—to the plug, in such a manner as to always retain a dry surface upon the actual plug, and thus prevent the electrical leakage caused in wet weather in exposed positions. It also does away with the usual milled or hexagon nuts for holding the wire in position. The end of the shield is intended to hold the insulation of the wire; and the wire itself is held by a small side screw, which may then for absolute security be covered with gutta-percha. The action of screwing down the cover makes

contact inside with the plug by means of a spring buffer. The cover is securely held in position against vibration.

The English patent was granted February 27th, 1902, and the French patent September 24th, 1902. Both cover every description of insulating shield. You will also observe, as has been previously pointed out, that in this plug it is extremely easy to use the Panhard spark gap by cutting off a small piece from the buffer pin. The spark cannot then fire any loose gas, being entirely enclosed.—Yours truly,

FRED. H. HADFIELD, M.I.E.E.

TAKING CORNERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I wish you would call the attention of motorists to the advantage of taking corners on the proper side of the road. I speak now of Northumberland, where I have had several very narrow shaves from cars coming fast round on the wrong side of the road. They are a danger to other vehicles as well as to motors, and only help to make motor-cars more disliked.—Yours truly,

P.

MERCEDES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice in your Journal of the 18th inst. that "Automan" in his "Continental Notes," in speaking of the Mercedes firm, makes the assertion that the word Mercedes is of Spanish origin and means Wednesday. I wonder why he says this, for it is the second time he has done so. Mercedes certainly is a Spanish word and is a woman's name. But it does not mean Wednesday, the Spanish for Wednesday being Miercoles.—Yours truly,

J. TODD.

MOTOR-CAR RACING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your correspondent S. J. C. Nixon rather gets away from the subject matter of this correspondence which, as originally started, concerns the influence of racing on car improvement, especially as regards the touring vehicle. In our last communication upon this subject we showed that racing had deprived the tourist for many years of several of the most important features of the touring vehicle, and in relation to what Mr. Nixon now says regarding the horizontal engine we may say that, whilst we admit that racing has, on the continent, resulted in the abandonment of this type of engine, we hold that—as we are believers in the horizontal type—in so doing racing has again done harm rather than good to the touring vehicle, for it is quite certain that the firms he mentions abandoned the horizontal engine in favour of the vertical one not because the latter is better, but simply because the public, blindly following the lead of "pace," called for it. We do not dispute Mr. Nixon's statement that success in motor racing has brought large business to the successful manufacturers, though where he gets his figures of £4,320,000 as the direct result of the Paris-Berlin race from we are at a loss to know, and we most certainly dispute their accuracy. But that does not affect the subject matter of our controversy, which relates to the effect upon the machine and not on the business done.

We are glad Mr. Nixon agrees with us in regard to the value of silence in a car—not only silent exhaust, however, but silence in transmission—but how Mr. Nixon can possibly assert, as he does, that "it is thanks to racing that we have discovered that it is not necessary for a car to 'bellow like a bull' to be fast," we cannot conceive, because it is

entirely discordant with facts. "Bang! bang! came the angry roar from the great exhaust box, which had the clamour of a huge tin can beaten by a blacksmith's hammer with lightning blows." Such is the description of Jenatzy's Mercedes in one report of the Gordon Bennett race last week, and if Mr. Nixon had been present at that event and the Dublin speed trials, as we were, he would have known that the description was not exaggerated. It is true that this car can be made to run with great quietness, but that is not when racing, and Mr. Nixon may not know, though it is a fact, that this said quietness was only attained when the firm adopted throttle control, which we had been using for five or six years, but which the makers of racing and other cars ignored because it was "not economical." The adoption of this, however has not been due at all to racing, as, when racing, silence is the last point considered. Again Mr. Nixon says the Gordon Bennett race has proved "that neither America, France, nor, I am sorry to say, England, can produce such a reliable, fast, silent, racing car as Germany." Well, we have shown above that silence in a racing car is *non est*; faster, perhaps, Jenatzy was, but it was as much the man as the machine, and as for reliability, as two of the three Mercedes cars in the race retired through broken axles (and it has been stated that the winner's also was cracked at the finish), whilst all three French cars went through without mishap, and the English cars were put out of action by road accidents and tyre troubles, this point goes certainly to the credit of the French, and at least as much to ourselves as to the Germans. So much for Mr. Nixon's conclusions, which it appears to us are about on a par with those which have led the public as a whole to so largely follow the lead of the racing machine, to its own loss.—Yours truly,

THE DURYEA MOTOR CARRIAGE COMPANY.

L.P. asks:—"Is a motor-car, when going on a road in a thunderstorm, more of an attraction to lightning than a carriage, or not?"

CLAIMS FOR DAMAGES.

R. S. RISPIN has obtained judgment for £25 and costs in the Manchester County Court against S. Etchells, whose motor-car knocked the plaintiff down in April last.

JOSIAH SHELLEY, of Oldham, sued J. H. Milner, of Leeds, at the Saddleworth County Court, for £50 damages, caused by the alleged negligent driving of a motor-car. The case for the plaintiff was that whilst driving in a trap over Standedge Hill he was run into by defendant's car, and he and his wife were badly injured. Without hearing witnesses for the defence, the judge held that a *prima facie* case had not been made out. The view he took was that the horse suddenly became restive and got in front of the car. The case was dismissed, but only out-of-pocket costs were allowed.

ALLEGED OBSTRUCTION.

EWART CHARLES AMOS, who did not appear, has been summoned before the Chichester County Bench for allowing a light locomotive to cause unnecessary obstruction on the highway at Bognor. P.C. Fry deposed to seeing defendant's motor-car left unattended for 53 minutes. Defendant afterwards wanted to "square" him. Fined £3 and costs.

CHARLES MOON was summoned for a similar offence at Bognor, and pleaded not guilty. P.C. Alce said he saw defendant's motor left for half-an-hour. Defendant contended that the road was wide, and there was no obstruction. He saw the policeman near the car and thought it was all right. Fined 10s. and 7s. costs.

A CHARGE DISMISSED.

At Kingston, on Monday, A. D. Billings was charged with stealing a motor-car and with wilfully driving the car as to cause injury to James Hughes, of the Coldstream Guards, at Cobham, on July 12th. The Bench dismissed the charge of stealing, but convicted for reckless driving, and imposed a fine of £10, or a month in default.

CLUB NEWS.

NORTH-EAST LANCASHIRE.

PRACTICALLY the whole of the members of the North-East Lancashire Automobile Club accepted the invitation of Mr. Briggs Bury to a garden party on the 17th inst. at that gentleman's residence, Bank House, Accrington. Unfortunately the weather was very wet, and only about a dozen cars were driven by guests.

POLICE TRAPS.

THERE is a police trap at the bottom of John o' Gaunt's Hill, entering Leeds. It is laid between the two bridges at Stourton, on the road from Pontefract.

A MEASURED distance of 220 yards between Basingstoke and Winchester has been prepared for the capture of motorists passing that way.

SEVERAL police traps have been established in the vicinity of Cardiff and Newport, Mon.

THERE is a trap between Hilton and Sudbury, near Derby.

POLICE officers are now stationed at Redbourne, Hibaldstow, Scawby, and other villages in the north of Lincolnshire, on the lookout for motorists.

OUR attention has again been drawn to the police trap between Iford and Christchurch.

By means of flash light the police of Slough hope to catch motorists travelling rapidly through the town at night time.

AT Worthing, a police constable has explained the latest device for the trapping of motorists. He took the time from the moment the motor car passed into the shadow of the blacksmith's shop at the south end of the Broadwater Green. Counsel for the defence submitted that to gauge the distance by means of a shadow which varied with the sun was very unsatisfactory, and he asked the magistrates under the circumstances to dismiss the case. Notwithstanding this a fine was inflicted.

THE police in the western suburbs have lately been active. There is a measured stretch of road between Hammersmith Bridge and Barnes Common worked by two constables with watches.

THERE is a measured furlong with electrical timing apparatus at Maresfield, about a mile and a half from Uckfield on the main road to East Grinstead.

FURIOUS DRIVING CASES.

AT Brentford the fine in motor-car cases is generally £10.

SIX motor-car drivers and three motor-cyclists have been charged at the Christchurch Petty Sessions with driving at excessive rates of speed. The police evidence was to the effect that the speed varied from sixteen to twenty-five miles an hour. The chairman (Mr. J. Kemp Welch) said that these being the first cases in the district only nominal penalties would be enforced, which varied from £1, including costs, to 32s. He also intimated that the Bench would take a severe view of future cases.

the young woman seemed to have run in front of the car. The summons would therefore be dismissed.

THE county justices at Windsor on Saturday had a number of cases before them, the fines amounting altogether to £54.

MR. D'OYLEY CARTE, of Weybridge, was summoned at Chertsey for driving a motor-car at Addlestone at more than twelve miles an hour on July 6th. Superintendent Hackman read several previous convictions against the defendant, who was fined £5 and costs. There was another case against the defendant for a similar offence on the 13th inst. Police-constable Bettison said he and Inspector Marks set their watches on the morning of the 13th, and then he was instructed by the inspector to go to Weybridge Station and take the time of any car which left or arrived at the station. Inspector Marks said that on the morning in question he saw Mr. D'Oyley Carte driving his car at an average speed of nineteen miles an hour. The "trap" had been laid for Mr. D'Oyley Carte. He took the time accurately. Mr. Crowdy called Frederick Wiseman, the driver of the car, who said Mr. D'Oyley Carte knew of the trap, and tried not to fall into it. He took his time for doing the distance in consequence of this, and went under twelve miles an hour. Defendant was fined 40s. and costs. Frederick Wiseman, the driver, was then summoned for a like offence, on the 13th inst. From the evidence of the police, it appeared that the defendant took charge of the car after Mr. D'Oyley Carte had left it to catch his train. Inspector Marks said that he told Wiseman that he should summons him every time he went over eighteen miles an hour. The Clerk: That means to say you never summons under eighteen miles? —Witness: No, never, unless there is danger. The Chairman said the fine would be 40s. and costs.

Mr. J. C. Percy on his 10-h.p. Ariel Car.

THOMAS MORRIS was summoned at Oxford for driving a light locomotive at twenty miles an hour at Lingfield. The machine was a quadricycle, and the defendant stated that he was taking his wife out for a ride when he saw sitting on a fence up the road a lot of boys. He was approaching a hill, and did not like to get off and push his wife up the hill for fear the boys would laugh at him. Accordingly he put on an extra spurt, and then he discovered that the boys were policemen!

ELEVEN motorists have been fined £78 at Newbury.

SEVERAL motorists have been fined recently at Epsom. There was a summons against Mr. Arthur Chase, well known in the cycling world, for furious driving at Sutton, but he proved to the satisfaction of the magistrates that at the time in question he was in Southend. The police stated that the person stopped gave Mr. Chase's name and address. The case was dismissed.

WILLIAM BROWN, of the International Motor Company, High-street, Marylebone, was summoned before Mr. Plowden at the Marlborough-street Police Court for driving a motor-car to the common danger. Constable Norman, 331 C, deposed that about ten o'clock on the morning of the 3rd inst. he saw the defendant driving a motor-car in Regent-street. A young woman named Catherine Payne alighted from an omnibus which was in front of the motor, and after stepping on to the pavement, crossed the road. As she was about to step on to the "refuge" the motor "drew out" to pass the omnibus and knocked her down. Mr. Plowden said that he did not see that the motor driver was more to blame than the young woman. He was on his proper side and was not going too fast. He did what was reasonable at the time, and

At Selby, C. A. White was summoned for furiously riding a motor-bicycle at Selby on the 27th ult.; and W. P. Green for having driven his motor-car at a greater speed than 12 miles an hour. Mr. Kemp, of Castleford, appeared for Mr. White, and raised the contention that a motor-bicycle was not a light locomotive within the meaning of the Act, and the Clerk characterised this as an interesting point. The decision of the Bench on the matter was, however, deferred. Eventually the Bench dismissed the case on the facts, and not on the point of law. The charge against Mr. Green was also dismissed.

At Rugeley, Captain Neil Haig, 6th Inniskillen Dragoons, was charged with furiously driving a motor-car on June 8th last, at Satnall Hills, a portion of the road between Rugeley and Stafford, in such a manner as to endanger the safety of passengers on the highway. John Brinckley said he was driving a herd of donkeys. At a bend in the road near the Satnall Hills a motor-car approached him from the wrong side of the road, knocked down a donkey, and dragged it for about twenty-five yards along the road, mangleing the animal so badly that it was necessary to shoot it. Captain Haig said that he was travelling at the rate of about ten or perhaps only eight miles an hour, but on seeing the donkeys he pulled up to about three miles an hour. He approached on the proper side of the road, but as the donkeys were scattered all about he changed his course in order to drive between them. He was nearly clear of the herd when one of the donkeys stepped in front of the car and was knocked down. The Duke of Westminster was called as a witness, but did not appear, and Mr. Staplee Firth informed the Bench that his Grace had been detained by an accident to his motor-car on the road. The Bench decided that there was insufficient evidence, and the case was dismissed.

Where no alleged speed is given it is understood to be above the legal limit. Pressure on our space prevents the publication of nearly fifty other cases of which we have received information.

IMPRISONMENT.

At the Newington Sessions, Alfred Field surrendered to his bail and pleaded guilty to wilful misconduct as driver of a motor-car, causing bodily harm to William Bettsworth. Mr. Hutton, for the prosecution, stated that Bettsworth was training for a walking match, accompanied by a friend on a bicycle, in Clapham Road, on the evening of June 8th, about ten o'clock. The defendant in his car came up from behind, and suddenly swerving to avoid a bicyclist, he ran into the walker, who was knocked down, run over, and dragged some distance.

The prisoner said the car was not his property. He was only the driver, and since this affair he had been dismissed from his employment. He was sentenced to a month's hard labour.

CANCELLING A CONTRACT.

FRANK MORRIS, of King's Lynn, sued William Clarke, master of the Workhouse at Downham Market, for the recovery of £2 5s., for the hire of a motor-car. Mr. Sadler, for the plaintiff, said his client contracted for the amount named to convey defendant by motor-car to Beckingham, near Loddon. Mr. Morris sent a vehicle, with his brother as driver, and with an assistant. On the journey from Downham one of the tyres came off just through Fincham, and the driver said he would go on, and drove without a tyre to Swaffham. It was a miserable and dreary day, and on reaching Swaffham Mr. Clarke refused to go any further by the motor-car, but preferred to continue his journey by rail. His Honour held that, under the circumstances, defendant was justified in withdrawing from the contract, and gave judgment for him, with costs.

THE Motor-Car Journal.

COMMENTS.

NOT only are the police prone to subterfuges in trapping motorists, but the frequency with which they don plain clothes to effect their purpose has become a scandal. In fact, motorists are sometimes stopped by ordinary persons who pose as policemen without authority. In a case at Colleshill against Mr. Ernest Owers, the question has been raised, and will, we hope, shortly be settled. Mr. Owers was charged with refusing to stop when called upon; but his counsel submitted that as the constables

were not in uniform no offence had been committed. He stated that he had the opinion of Mr. Charles Matthews upon the point that no offence was committed unless a constable was in uniform. Mr. H. Maddocks (the magistrates' clerk) said that he should advise the Bench that the offence was committed whether the constables were in plain clothes or in uniform, as motorists who refused to stop when called upon did so at their own risk. As to whether the person who stopped a motorist was a police constable or not, Mr. Maddocks pointed out to Mr. Minton-Senhouse (counsel for Mr. Owers), that the driver should ask the person, if he were in plain clothes, for his warrant to prove that he was a constable. Mr. Minton-Senhouse said that he might ask for a case upon this point, and the Bench expressed their willingness to state a case if desired.

The Midland Hill Climb.

THE Midland Club are to be congratulated on the success of their hill climbing competition on Saturday, and the courtesy they extended to the Press might well find emulation on the part of organisers of other contests. Mr. Aveling's urbanity was conspicuous, and the way in which all the arrangements were conducted reflected credit on all concerned. The Napier and the Motor Manufacturing Company did well, and none will grudge Mr. Iden the success he achieved with his 20-h.p. car, which has shown itself a worthy rival of many of foreign make.

A Sad Accident.

IT was a regrettable accident on Sun Rising Hill, Warwickshire, on Sunday evening, when two lives were lost. Mr. and Mrs. C. Alger, of Diss, with Mr. Chas. Alger and Mr. J. J. Brittain, had intended going on a motor tour in the Thames Valley. On Sunday they reached the hill where the climbing competition had taken place on the previous day. On the hill are two curves, one of them very sharp, and it was in descending towards the last bend that the accident happened. The car was travelling down the slope at the rate of eighteen miles an hour. At the curve the car overturned and shot into the hedge. Mr. Charles Alger was thrown upon his head and killed instantly. Mr. Alger, sen., sustained a broken neck and died within half an hour. Mrs. Alger was severely shaken, while the other member of the party escaped with a few superficial bruises and abrasions.

A Club Warning.

THE fixture card of the Leicestershire Automobile Club is interesting as proving beyond doubt that motorists are not the wild, harum-scarum people some would think them to be. The committee wish to impress most emphatically on all the members of the Club the advisability of driving with every possible consideration for other users of the road. They are most anxious that all members of the Leicestershire Automobile Club shall earn a good name for careful and courteous driving, both with the police and throughout the county. Last Saturday the Club had a run to Matlock, and on the 13th inst. will journey to the Monastery via Loughborough and Nantanton, returning by Markfield.

Motor-Cars in India.

THE automobile has become thoroughly acclimatised in our great Indian Dependency, where its adaptability to the varying conditions of the road surface should give it a great future. Carriage builders in India are already studying the details of the new locomotion, and Messrs. Simpson and Company, of Madras, have commenced the construction of steam cars under the superintendence of Mr. S. J. Green. The firm have put down special machinery for the manufacture of the parts, and the only fittings imported are the "Clarkson" burner and some minor accessories. Hitherto the Indian Government has been somewhat laggard in its encouragement of the automobile; now, however, that it has developed into a local industry we may look for a more tolerant attitude.

More Societies.

ON how slight a pretext may men form new organisations? There is a Pedestrians' Protection League, with offices in the West-end of London, a society for the protection of those who walk along the highways, with headquarters at Shrewsbury, and now comes a suggestion from Mr. R. D. Yelverton, who writes from the Temple with regard to the formation of a Motor Control Association. "Such a society," he believes, "would be valuable in sustaining public opinion in Parliament, and in aiding the authorities to enforce the law." We confess our vision is not parallel with that of Mr. Yelverton. Why should he be content with "sustaining" public opinion and "aiding" the authorities. Far better to take the place of Parliament itself and supplant the authorities altogether. What is wanted, is a Society for the Suppression of Societies.

No Lights.

THE necessity for motorists adequately providing for efficient lighting of cars has been emphasised by fines inflicted on neglectful motorists at Colchester and Slough during the past few days. Now that the evenings are drawing in, and the hours of sunlight are being appreciably shortened, motorists would do well to give heed to the lighting of their cars. At a time when legislation is impending all owners and drivers should be most careful on this point, or they may find even more stringent

regulations suggested. It is not a very difficult matter, but its neglect may work great hurt to the future prosperity of the movement.

The Size of Lamps.

In the House of Lords Lord Balfour of Burleigh has suggested that motor-car lamps should be lessened in size and number, a suggestion that will not be received with great favour by motorists.

The tendency nowadays is to increase the size of lamps, and the only possible objection to this is the glare that is seen by persons approaching the car from the opposite direction. This, however, can be regulated and directed on to the road surface. There is scarcely sufficient importance in the matter to warrant any restrictions, and certainly the maximum of light is desirable when travelling at night.

The Daughter of Mr. E. W. Hart, of Luton, on her Electrical Car.

The Wear on Roads.

At the meeting of the Surrey County Council, held at Kingston-on-Thames on Tuesday, the county surveyor presented a report on the highways of the county, in which he said:—"The traffic of traction-engines and motor-cars is very much increasing, and the traction traffic has caused much damage during the winter to the flint roads. The motor-car traffic has had a curious effect upon the roads, especially upon flint roads on a dry foundation. The large rubber tyres separate the small metal from the large and extract it, and it is a common occurrence now, after a dry day, with heavy motor traffic, to find long lengths of such roads as the Portsmouth road, where the surface has been perfect in the morning, covered with a fine sharp grit, which had been sucked up during the day by india-rubber tyres. This movement of the small metal allows the large stones to grind and wear more rapidly than when the

interstices are properly filled and the road more solid." In moving that an increased amount of £50,000 should be allocated to the repair of the main roads during the current year, Mr. E. Ellis said the increased cost was incurred more on rural roads, so much used by motor-cars, than on urban roads. Personally he found that a car going at a rapid pace on a gravel or flint road practically tore the road all to pieces; and he looked forward with apprehension to the time when motors would be much more extensively used than at present. The recommendation was carried.

Attitude of the Railways.

EVIDENTLY the Great Eastern Railway Company and the North-Eastern Railway Company regard the motor-car in different lights. At the half-yearly meeting of the former company on Tuesday, Lord Claud Hamilton said he wanted to raise his voice and to be supported in so doing by the shareholders of that and other companies against the unequal legislation which it was proposed to pass in respect of motor-cars and light railway and tram companies. He would like to know by what form of logic it could be argued that whereas speed limits were necessary for conveyances running through private property on rails, they could not have a speed limit for motor-cars that could run where and how they liked.

Encouragement in the North.

WHILE the chairman of the Great Eastern Railway thus shows his antipathy to automobilism, the directors of the North-Eastern are proposing to utilise the motor-car in their service, and have just made a conditional promise to try an experiment of running several motor-car buses for passengers and goods from their Richmond and Leyburn railway stations up to Reeth, in Swaledale, providing their experience in this direction in the Beverley district proves successful. This would be a great boon to Reeth and Swaledale generally, and would, no doubt, lead to a large number of people visiting this charming district.

The Wiser Policy.

THIS is the proper attitude to assume, and we are surprised that Lord Claud Hamilton should have regarded the subject in so narrow a light. The railway companies cannot afford to denounce the motor-car, and to ignore its possibilities is folly indeed. In adopting the automobile to connect their stations with thinly-populated districts, the North-Eastern Railway Company is showing an enterprise which may prevent the competition of private persons and municipal bodies. This is a policy that seems more worthy of encouragement than idle vapourings against a measure which seeks to bring to an end the illegalities and absurdities which have been perpetrated in the name of justice these last few years.

An Irish Race for 1904.

MR. R. J. MCCREDY suggests that an international alcohol competition over the Gordon Bennett course should be held next year, and has proposed the following regulations:—Each competing country to use alcohol of its own manufacture, the English cars, however, using Irish alcohol; a team of three home-made cars to be entered by each nation, with native born drivers; the cup to go to the best team, and a special prize to the driver of the first car; cylinder capacity of the motors to be specified and to be identical, and a *minimum* weight for the cars to be fixed; the engine dimensions could be so arranged that the cars would be of normal horse power; and the speeds would, therefore, not be so excessive as in the cup-race of 1903; the number of controls to be diminished, stoppages only to be made at Kilcullen, Kildare, Athy, and Carlow; the route to consist of two circuits of the east section, and three of the west; distance, 261 miles. Should the idea fructify, surely

some more interesting course could be obtained. Why not a run from Dublin to Cork, passing through co. Wicklow, and thus giving the south an opportunity of sharing in the spoils?

A Clergyman's View.

WE would thank the many Yorkshire readers who have sent us information with regard to the proceedings of the last meeting of the Bridlington District Council. The Council, it appears, resolved to petition against any raising of the present speed limit for motor-cars, and in favour of the licensing of all drivers of motor-cars. The resolution was moved by the Rev. G. E. Park, who said he strongly objected to the public being endangered by a madman "on a mechanical carriage, pushed by a half pint of petrol, and seated on half a ton of scrap iron and a stink." Such vivacity of utterance may please the gallery, but it does not help matters very much. At the present time archbishops and bishops are taking to the motor-car with evident delight; surely the lesser lights of the Church are not seeking to discourage those in authority over them.

Fancy Phrases.

SOME noble lords are also introducing a picturesqueness of description into the motor-car controversy that would have done credit to the vestries of the last century. "Ghastly goggled motor guys" is the definition of the motorist as given by the Earl of Wemyss, and Lord Kelvin has described the automobile as "the rich man's toy." Fortunately the movement is sufficiently well established not to be disturbed by some fanciful descriptions.

The Motor Car Bill.

ON Tuesday the House of Lords finished with the Motor-Car Bill, and Mr. Balfour made reference to the measure, which was included among the Bills that the Government hoped to pass, but which could not pass if they met with prolonged discussion. The Bill dealt with a subject that had caused a great amount of feeling, and a Bill of that kind could not pass unless those deeply interested in it would restrain their debating powers in defence of their views. By universal consent the present law was unsatisfactory, and he should regret if the matter remained unsolved until the House reassembled. If the Bill was treated in an unsympathetic spirit there was no chance of it becoming law. Later in the evening a meeting of those interested in the subject was held at the House of Commons, when it was agreed to accept the Motor-Car Bill as it came from the Lords. The general opinion was that the Bill was not altogether favourable to motorists, but that the Government's solution should be accepted as the best to be obtained in the circumstances, and in view of pressure of time.

A Western Club on the Bill.

A SPECIAL meeting of the Cheltenham and Gloucestershire Automobile Club, to discuss the Motor Regulation Bill recently introduced into Parliament by the Government, has been held at Cheltenham. The president (Dr. H. P. Fernald) was in the chair. The Bill was considered clause by clause, and was approved with some reservations. The first amendment suggested was in Section 1, which seeks to enact that if any person drives a car recklessly or at a dangerous speed, having regard to the circumstances and the amount of traffic which is or which might be expected to be on the highway, he shall be guilty of an offence. It was unanimously agreed that the words italicised ought to be deleted as creating great uncertainty, and as placing arbitrary power in the hands of the police and magistrates. With regard to the proposed penalties, it was felt that they are excessive, especially when contrasted with the nominal penalties inflicted on offending drivers of horse-drawn vehicles. The following resolution

was unanimously passed:—"That this club is of opinion that the section imposing fines and imprisonment is unnecessarily harsh and unfair to the owners of light cars, voiturettes, and motor-cycles, and that the former resolution of this club as to graduated fines, based upon the horse-power of the vehicle, should be substituted, and by this means more uniformity of punishment be ensured. And, further, that the portion of the section relating to imprisonment without the option of a fine should be entirely deleted." The previous resolution referred to reads thus:—"That fines for excessive speed should be proportionate to the horse-power of the motor-vehicle, and that the present limit of the fine of £10 is excessive for persons of moderate means." It was decided to send copies of the resolutions to the Secretary of the Local Government Board, the local M.P.'s and Mayors, and others likely to influence public opinion.

The Countess of Chenorelle and Mrs. C. Friswell on a Peugeot Car at St. Germain.

Attendance Required at Slough.

RECENTLY Mr. Stuart Forster, J.P., was summoned to appear at Slough to answer a charge of having no tail lamp on his car when driving through the town. He wrote to the Bench admitting the offence and pleading guilty, giving as his reason for absence the fact that "I do not wish to add to the expense of this summons either in time, travelling expenses, or lawyer's fees." Mr. Forster heard nothing more until the 17th of July, when, in the morning, a policeman went to his house in London and arrested him under a warrant. Mr. Forster was taken to the Walton Street Police Station, and detained in custody there for about three hours pending the arrival of a constable from Slough. When he came he took Mr. Forster to Slough by train, and marched him to the police-station there. They then sent for a magistrate, who released him on entering into his recognisances. Mr. Forster attended with his counsel, Mr. Mears (instructed by Messrs. Firth and Co.), on the adjournment; for when the magistrates read the letter from Mr. Forster, they adjourned the case for a week. Although the clerk should have sent notice to Mr. Forster, no intimation of any kind was given, and when he appeared on the return of the warrant, no apology was offered to him.

The Motor Volunteers.

THE Motor Volunteer Corps will play an important part in the coming great manoeuvres in the western counties. The commanding officer of the corps has been instructed by Lord Roberts to provide a large number of cars to be driven by his officers and members, and to be attached to the four great camps. A number of motor-cyclists are required for this period, i.e., September 5th to 12th inclusive, and as a suffi-

cient number have not yet enrolled in the corps, motor-cyclists are called upon to enrol at once at 11, Tothill Street, Westminster, S.W., in order that they may be ready for the manoeuvres. On the 21st ult. Mr. H. S. H. Cavendish was on duty for Major-General L. Oliphant on inspection work. On the 22nd ult. he drove General Oliphant to Caterham; on the 24th ult. to Guildford. Mr. J. S. Goodhart was employed recently by Major-General Sir W. F. Gatacre, K.C.B., D.S.O., to make an inspection of a proposed manoeuvre area in the eastern counties, near Bawdsley.

Untrue Reports.

WHILST we denounce with no uncertain tone the conduct of those drivers who show no consideration for other users of the road, we cannot fail to be indignant when leading public men quote any unauthenticated cases of motor mishaps appearing in the daily papers. The Earl of Camperdown, in the House of Lords a few days ago, referred to a young lady at Chesham, whose horse was alleged to have been frightened by a motor-car, with the result that she was thrown. The driver of the motor car was said to have rushed off with no inclination to render assistance. It turns out that the horse was frightened by a hay-making machine in a neighbouring field, and that it was not till after the accident that an automobile came in the opposite direction to which the lady was going, and rendered every help in conveying her to the local hospital. It is really regrettable that the controversy now raging around the automobile should be embittered by the publication of false reports of this kind, and motor-cars further prejudiced by their recital by public men, who apparently are not always careful to obtain authoritative information. Since these lines were written the Earl of Camperdown has read in the House a statement to the effect that the information in the papers was erroneous; but why did he not make inquiries before giving further publicity to the error?

Dust Trials.

WE note with satisfaction that the Trials Organisation Committee for the current year are giving attention to the dust question. At their last meeting it was decided that Colonel Crompton and Mr. Basil Joy should act as a sub-committee to propose preliminary experiments, and perfect the details of a scheme for carrying out dust trials. We understand that Colonel Crompton has suggested that a certain portion of the road should be covered with a good quantity of suitable material, and the cars should be driven over this prepared portion at the same speed as on that which has not been treated. Photographic records of the dust raised will, it is thought, secure some reliable guide as to the dust-raising powers of each particular type of motor-car.

The Royal Progress.

ON Saturday afternoon the King and other members of Lord Londonderry's house-party set out from Mount Stewart for Portaferry in three motor-cars. On the return journey, in the course of a very steep ascent, however, the car suddenly stopped. A crowd immediately ran forward, and some of the people appeared anxious to shake hands with the King, but a number of officials and police intervened. The car was then pushed up the hill by bluejackets and police. The machine having been quickly got into order again, the car proceeded on its way, but it had not got very far when it again halted. The second stop, however, was only of momentary duration. The journey was almost immediately resumed, and was completed without further incident. On Sunday the King and Queen visited Lady Dufferin at Clondeboye, proceeding thither by motor-car. The Marquis of Londonderry and the Duke of Abercorn went before their Majesties in a pilot car. In the next vehicle were the King and Queen and Lady Londonderry, Earl of Shrewsbury driving. Princess Victoria was in the third car. His Majesty sat on the front seat with the Earl, Her Majesty

and Lady Londonderry being in the tonneau. Having visited Lady Dufferin, the party motored for about forty miles.

In Ireland.

ON Thursday of this week it was arranged that their Majesties should have a motor tour in Connemara. On Tuesday evening his Majesty's car, together with eight or nine others for the use of the Royal and Viceregal party, arrived from Dublin. Her Excellency the Countess of Dudley, who was attended by the Hon. Cyril Ward, motored over from Recess, and was accorded a cordial public greeting at Leenane. Mr. Horace Plunkett, Vice-President of the Agricultural Department, also arrived at Leenane. His car had already taken him on a tour of inspection over the roads which their Majesties will traverse in the journey through some of the prettiest scenery in Connemara.

The Fatal Accident.

ON learning of the accident referred to on a previous page, the Wolseley Company sent a representative to Sun Rising Hill to assist in any way that was possible. Mr. C. B. Alger, junr., was an expert driver, and the agent for Wolseley cars in Norfolk. The car he was driving was one of their earliest type of 10-h.p. cars, which he used for his own driving during the past twelve months. It can only be surmised that Mr. Alger, not knowing the hill, was taking the corner rather too fast considering the nature of the gradient, and probably the inside wheels had run in the gully on the inner side of the road, and in turning the corner this caused the car to upset. The car was examined before it was removed from the hill, and no fracture of any mechanical part was found; the brakes are all in good condition, the shoes of one of the hand brakes showing just the slightest sign of charring. The coroner's jury on Wednesday returned a verdict of "Accidental death."

Tyres.

ON another page we publish the results of the quarterly 100 mile trial of the A.C.G.B.I. held on Friday, the 24th ult., from which it will be seen that another test of the reliability of the motor-car was established. Unfortunately tyre troubles were again very prominent in the observers' reports, and one vehicle had actually to abandon the run owing to the innumerable tyre troubles which followed its career to Dashwood Hill. Only one out of four vehicles seems to have escaped the difficulties of its rivals in this respect. This is a result which should give makers of tyres food for thought.

THE entries for the reliability trials of the A.C.G.B.I. number 121 cars and 43 motor-cycles.

ON Monday, Mr. H. R. Wilding started from the Hotel Metropole, London, on a 10-h.p. Renault, for a commercial tour of the country.

DURING the visit of the Prince and Princess of Wales to the West of England the Royal motor-car showed signs of stubbornness on at least two occasions, and had to be pushed up the Peak Hill, Yelverton, and the Devil's Bridge, Princetown.

LIEUTENANT GANDY, in command of two non-commissioned officers and 50 men of the Telegraph Battalion Royal Engineers, from Woolwich, has left for Somaliland, where it is reported the Government propose constructing a narrow gauge railway and a line of telegraph across British Somaliland. Motor cars, camels, and mules will be employed in the transport of the plant.

THE failure of Mr. J. W. Cross to reach the top of the hill in the Midland competition reported on page 424 was not due to the power of the 20-h.p. Humber car being insufficient to negotiate it, but to the fact that he had not enough petrol in the tank to keep the carburettor full when on the steepest part of the grade. After he had started again the engine stopped, and on trying to start it he found that there was no petrol in the carburettor.

THE PASSING OF THE SPEED LIMIT.

THE man in the road, to adapt a phrase familiar in political circles, is somewhat prone to regard the motorist with aversion and with prejudice. Peering through goggles, garbed in unconventional raiment, and mounted on a mechanical steed, he presents a picture of ferocity that has alarmed the bucolic mind. Rushing through the country in a whirlwind of dust, and, in the earlier days vying with the perfume of new-mown hay in a somewhat odorous progress, he has incited attention in others.

And so there has already developed a tradition with regard to motorists that promises to linger in the countryside. Many rashly assume that the motorist is heedless and heartless, that he delighteth in worrying animals and scaring nervous J.P.'s, and that his ways are paths of wickedness. A moment's reflection should demonstrate the absurdity of such an idea. Firstly, the motor-car is not a costless article; it represents a great expenditure of money, and no owner would rashly run it into danger. Besides the damage to the car, there is always the fear of severe or fatal accident when reckless driving is indulged in. It therefore follows that no motorist is so insane as to tempt danger or attempt the impossible. Motorists are, after all,

On the one hand, it has produced a system of police ambushes and technical summonses, which have irritated the motorists, and, on the other hand, it has resulted in an embittered feeling in the general public against all persons who use motors, which as a dangerous class feeling is perhaps without parallel in modern times." All who have watched the steady growth of our list of cases of alleged furious driving must recognise the cogency of the statement of the President of the Local Government Board. By disguising themselves, by secreting their persons behind hedges, by resorting to tricks of any kind, the police in many places have become demoralised, and, goaded by county magistrates and rural councillors, they have secured convictions which have often been unfair and unjust. "Mr. Long holds that this unfortunate and even dangerous state of affairs constitutes the most trenchant condemnation of the existing legal speed-limit. It is his confident hope that by abolishing the technical and unenforceable speed-limit, and by making the motor-driver responsible for reckless driving at any speed, he will concentrate the attention of the motorist on what is, after all, the only crucial question, namely, the safety and comfort of the users of the road, whether a car be travelling at two or twenty miles an hour."

It is to be hoped that, whatever else happens to the Bill,

An Exciting Moment at the Empire City Race Track, New York.

human beings, and must be considered as possessing the feelings of ordinary men and women.

This fact is recognised by the Government and its supporters in its new motor legislation. Already agriculturists and horse-breeders have denounced the Government for agreeing to the abolition of the speed limit, and have drawn alarming pictures of what will happen if those who drive cars are not restricted to a certain mileage per hour. Mr. Long's reply to this view of the case is clear and emphatic. Writing on his behalf from the office of the Local Government Board, Mr. R. G. Duff says:—"Mr. Long is advised by those who are administratively in touch with the question of safeguarding the public, that the present legal limit of speed does not, in fact, constitute any effective protection to the ordinary users of the roads. The effect of the legal limit is rather to distract the attention both of the police and of the motorist from the vital question, the safety of the public, to the comparatively unimportant, and in all cases highly controversial, question of the actual speed in miles per hour at which a particular car is travelling. A legal speed-limit has now been experimentally in operation for some five years; but the area of its observance has been practically limited to the field of vision of the local policeman, and even in that narrow field it has often been impossible to prove its infraction. The law has been ineffective, and has been brought into contempt. It has failed to protect the public. It has failed to suppress the abuse of the roads by motorists,

the clauses relating to the abolition of the speed-limit will remain. There are many incongruities and absurdities which we may have to suffer and tolerate, but upon this point there must be no wavering. Let the public be assured that reckless driving brings danger to the motorist as well as other users of the road—that it is, in fact, more dangerous to the man on the car than the man in the street. Then there should be no difficulty in assimilating the law with regard to motor-cars to that affecting other vehicles, and securing that "driving to the common danger" is made the actionable offence instead of merely driving at a rate which is faster than is possible by any other means of progression on ordinary roads.

THE Torquay and District Motor-Omnibus Company, Limited, has been registered with a capital of £10,000, to provide a service of motor-omnibuses for Torquay and district.

FROM Messrs. J. Griffin and Co., of Portsmouth, comes a motoring diary devised by Mr. Q. O. Grogan. This is the size of an ordinary manuscript book, the pages being divided into columns in which the owner can insert particulars of his consumption per run, number of persons carried, and other details. A goodly number of pages are reserved for remarks, and altogether the volume is one that is likely to be useful for motorists who care to add a system of book-keeping and diary recording to the pleasures of their touring.

THE MIDLAND HILL CLIMB.

THE hill-climbing contest for the Midland A.C. President's Challenge Cup, on Saturday, proved one of the most interesting and successful of the events the club has organised. The weather was bright and warm, and an influential gathering assembled to witness the contests, in which several well-known competitors took part. A large gathering assembled

The Scene at the Starting Point.
[McNeil, Stratford-on-Avon.]

in the club enclosure at Sun Rising Hill House, and at the top and foot of the hill. Amongst those present, in addition to those whose names appear among the competitors, we noticed the Lord Mayor and Lady Mayoress of Birmingham, who had motored over, Mr. J. Broughton Dugdale, Messrs. C. Maudslay, senr., C. P. Type, hon. treasurer of the club, F. Lanchester, F. W. Lanchester, G. H. Lanchester, G. Patterson, J. D. Siddeley, H. Sturme, E. O. French, H. Luff-Smith, E. M. C. Instone, and others.

The contest was limited to petrol touring cars, each with its full complement of passengers, and the venue was Sun Rising

The Finishing Point.
[McNeil, Stratford-on-Avon.]

Hill, near Stratford-on-Avon, famous for its historical associations, and now, at any rate amongst motorists and cyclists, for its stiff gradients and sharp, unexpected bends. The stretch of the hill selected for the contest was 1,000 yards in length. Two stops, each of half-a-minute duration, were arranged, the second being only 500 feet from the finishing point. The finish was a "punishing one," and was indeed the crux of the contest, the hill being steeper there than at any other point, and giving a gradient

slightly under 1 in 6.50. The trial, it will be seen, necessitated the greatest skill and judgment in driving, and was calculated to exhibit the promptitude with which the cars could be got into motion on a severe incline. Fortunately the surface of the road was in good condition, and the arrangements were so complete and admirable in every way that no hitch occurred during the afternoon. This result was due to the unremitting attention bestowed upon every detail by the hon. sec. of the club, Mr. T. C. Aveling. To prevent accidents in case of brake failure at the stopping stages, ropes were thrown across the road on the arrival of the car, but happily these were not needed.

There were thirty entries, and of the twenty who actually took part in the competition only three failed to make the ascent.

The competitors, with the times in which they accomplished the climb, were as follows:—

Entry No.	Name of Driver.	Name of Owner.	Maker of Car.	H.P.	Time of Ascent. min. sec.
1	C. Vernon Pugh	C. Vernon Pugh	Lanchester ...	10	6 7½
2	W. B. Davies	W. B. Davies	Traffic Manfg.	12	Retired.
3	J. A. Holder...	J. A. Holder...	Panhard ...	24	3 32
4	A. Millership	A. Millership	Lanchester ...	10	5 24½
7	H. F. L. Hemmings	F. W. Keen ..	" ...	10	5 57½
9	T. B. Browne	T. B. Browne	James and Browne	18	3 57½
10	J. W. Cross ...	J. W. Cross ...	Humber ...	20	Retired.
11	H. H. P. Deasy	H. H. P. Deasy	Rochet and Schneider	16	4 17½
12	C. C. Maudslay ...	C. C. Maudslay ...	Maudslay Motor Co.	15	Retired.
14	C. Edge ...	S. F. Edge ...	Napier ...	20	2 55½
16	G. Iden ...	Motor Manfg. Co.	Motor Manfg. Co.	20	3 21½
18	E. W. Lewis...	E. W. Lewis...	Daimler ...	22	3 33½
19	J. V. Pugh ...	J. V. Pugh ...	Lanchester ...	10	5 25½
20	F. S. Bennett	Anglo-American Co.	Cadillac Automobile Co.	6½	5 12½
22	A. Callan ...	Wolseley Co.	Wolseley ...	24	3 55½
23	A. E. Crowdy	"	" ...	20	3 45
24	Remington ...	H. Austin ...	" ...	12	4 56½
25	Max R. Lawrence	Max R. Lawrence	Lanchester ...	10	6 8½
26	G. Lanchester	G. Lanchester	" ...	16	4 14½
27	Hon. C. S. Rolls	Hon. C. S. Rolls	Panhard ...	15	3 26½

The following cars gave the best gross times:—

- 1 20-h.p. Napier driven by Cecil Edge ... 2.55½
- 2 20-h.p. M.M.C. driven by G. Iden ... 3.21½
- 3 24-h.p. Panhard driven by J. A. Holder ... 3.32
- 4 22-h.p. Daimler driven by E. W. Lewis ... 3.33½

Owing to several protests, the actual winner of the Challenge Cup was not known when these lines were written.

Although the Maudslay car failed to negotiate the Sun Rising Hill in the competition on Saturday, we understand that the same vehicle climbed the hill three times successfully on the previous day. Mr. Maudslay was determined to take part in the contest, though he was far from well at the time.

When the competition was over Mr. G. Iden essayed to take a 20-h.p. M.M.C. omnibus with six passengers on board, including the writer, up and down Sun Rising Hill. Both the ascent and descent were accomplished without a hitch or in any way showing an undue strain to the working parts of the vehicle. A ride back to Stratford-on-Avon in this car was very agreeable.

Mr. Callan, on a 24-h.p. Wolseley, mistook the ropes for a chalk line, and so pulled up at a wrong place on the hill, thus losing his chance of winning.

In addition to the challenge cup presented by Mr. J. Broughton Dugdale, J.P. (president of the club), a certificate will be awarded to each car and driver successfully making the climb. At the conclusion of the competition a dinner was provided at the Shakespeare Hotel, Stratford-on-Avon, where a large gathering assembled.

CONTINENTAL NOTES.

By "AUTOMAN."

THE utility of the automobile in time of war has been more fully recognised by the French War Office than by any other similar department in other countries. Continual experiments are being made in many directions, and the successful trials are gradually leading to the adoption of the new locomotion. Much, however, remains to be done, and there will certainly be in the near future a large amount of public money expended in the direction of seriously equipping the French army with automobile transport vehicles, which have now become obligatory for warfare in civilised countries.

It has been clearly demonstrated by experiments made with a C.G.V. car, that a quick-firing gun mounted on an automobile can make itself very much felt by its rapid change of position. During the late manoeuvres very good practice was made at targets placed along the line of advance. The cars were fitted with

request of the firm of Paris-Automobile, which, on the eve of the race, had signed a contract for the purchase of the whole production of the Hotchkiss works.

THE Hotchkiss racer has a motor with four steel cylinders and an aluminium water jacket placed around them. It is so constructed that there is no water joint whatever, and therefore no possibility of the water getting into the cylinders. This is the first time that a steel-cylindere motor without water joint has been made, and it is owing to a great extent to the supposed necessity for a water joint that steel has been abandoned by several makers. The crank shaft of the Hotchkiss motor is mounted on ball bearings, which has been found to give great satisfaction and to allow the cylinders to be placed closer together than would be the case if ordinary bearings were used. The motor weighs 270 kilos, or three kilos (a little over 6 lbs. 9 ozs.) per horse-power. The radiator is of the honeycomb type, the valves mechanically actuated, and the carburettor automatic with a throttle. The side frames are of stamped nickel steel. Though exceedingly fast, the Hotchkiss

Prince Ludwig Ferdinand of Bavaria in his Motor-Car.

[Automobil Welt.]

strong pneumatic tyres, and a kind of turret of steel for the protection of the passengers. From inside this turret a Hotchkiss automatic quick-firing gun capable of being pointed in any direction commanded the surrounding country. The car made a very respectable average speed with its 15-h.p. motor.

MUCH has been said and much has been written as to the uselessness of high-speed cars. Such, however, does not seem to be the opinion of the French War Office, for this type of vehicle is specially chosen for the transport of the commanding officers and suitable drivers of them are at a premium, much to the chagrin of the commanders of units, who are now never safe from an unexpected visit of the Commander-in-Chief, who may swoop down on them at any minute at the rate of sixty miles per hour. During the coming autumn manoeuvres the great Fournier himself will be driving one of the best known Generals in the 90-h.p. Hotchkiss racing car. This vehicle was entered for the Paris-Madrid race, and withdrawn at the last moment at the

racer runs quietly and smoothly, and is as easy to drive at five miles an hour as it is on its highest speed. Like the Mercedes, it is not a freak of a special racing vehicle, but is eminently suited for touring purposes.

THE Deauville automobile meeting has been abandoned, much to the regret of automobilists as well as visitors to this seaside resort. The fact is that the promenade is not long enough for the racing cars of 1903 to get up speed. It will be remembered that last year at Deauville some marvellous records appeared in the papers, and that later on it was discovered that the time keepers had made a mistake, the records having to be cancelled.

ON the other hand, the hill-climbing competition at Laffrey is to take place on the 9th August. Laffrey Hill is at the foot of the Alps, beyond Grenoble, in the Dauphinais, and is a very difficult ascent, and quite suitable to the requirements of a competition of

this kind. It is about four miles in length, and rises about 650 yards, with an average roundly of 9 per cent. and a maximum of 12.8 per cent., the road being on the rise all the way. In 1901 a 16-h.p. Peugeot held the record of 16 minutes 23 seconds, but in 1902 a 20-h.p. Darracq reduced the time by just ten minutes in bad weather. There are to be four classes, namely, voituresses, light cars, heavy cars, and motor-cycles under 50 kilos in weight (3 qrs. 26 lbs. 4 oz.). In the Tourist section there are three classes, namely, single-cylinder vehicles with two passengers, two-cylinder vehicles with three passengers, and four-cylinder vehicles with four passengers. There is also to be a class for omnibuses carrying fifteen passengers. The entrance fees vary from 20 to 100 francs.

BRUSSELS is suffering from a severe attack of motorphobia, owing to a ridiculous decision of the Courts of Appeal, which have decided that, notwithstanding the law of 1899, the burgo-master can limit the speed of motor-cars in the city. Consequently in certain streets the order has gone forth that automobiles must proceed *au pas*, that is to say, "at a walk," and chauffeurs are wondering what the walking pace of an automobile is. Naturally other towns with motor-hating mayors are

A De Dion Car on the Bridge of Boats over the Po, near Ferrara.

On the Road between Utrecht and Amsterdam.

TOURING SNAPSHOTS.

taking extreme measures, and rendering themselves ridiculous in the eyes of the reasonable public.

ON Sunday last, on the Seine, near Paris, there was a 100 kilometre race for motor-boats. The weather was most unfavourable, the sky being lead coloured and sending down from time to time floods of rain. An unfortunate accident marred the day's proceedings, for the Marsouin, belonging to M. Perignon, took fire whilst making a trial run, and the burning petrol forced the owner and a *mecanicien* to jump overboard to save their lives. The owner was successful, but the *mecanicien* was drowned, and the boat, after burning for more than an hour, sank. There were altogether twenty-three starters, and the best time made was an average of 22 kilometres (13½ miles) by the "Flore," owned by M. Senet and driven by a 24-h.p. Otto engine.

A NEW and novel departure has just been taken by Messrs. De Dion Bouton and Company, who are organising an automobile tour limited to users of De Dion cars and their friends. The tour will last from the 20th to the 30th August, the programme being: August 20th, Rheims; August 21st, Givet; August 22nd, Luxembourg; August 23rd, Treves; August 24th, Coblenz; August 25th, a steamer trip on the Rhine; August 26th, Baden Baden; August 27th and 28th, rest; August 29th, Strasburg; and August 30th, Nancy. A travelling repair shop will accompany the party, so that any slight repair that may be needed may be effected *en route*.

CAPE TOWN, July 8th.
HAVING had a spell of fine weather, the motor trade has been brisk here. Mr. Partridge, a prominent Cape Town lawyer, has obtained a 10-h.p. Lanchester. His previous car was a 4½-h.p. De Dion voituress. The good run made by Mr. Jeppe's 10-h.p. Lanchester, and referred to in my last letter, created a road record between Durban and Pietermaritzburg, accomplishing the distance in 4 hrs. 32 minutes. The fastest mail train time is 4 hrs. The road is simply appalling, and the driver was warned by a number of old residents that he would not be able to get the car through, owing to the awful state of the road. But he got there just the same.

ANOTHER good journey has been made by Mr. Donald Menzies. The car was a 7-h.p. Panhard which has been purchased from Mr. Menzies' firm by a resident of Oudtshoorn, C.C., and Mr. Menzies undertook to drive the car there. The route was via Swellendam and Mossel Bay. Mr. Menzies and the car arrived

at Oudtshoorn on June 10th, the net running time for the 335 miles being 23 hours.

MR. MENZIES turned up at the Green Point Athletic Grounds last Thursday afternoon in his car, and although cabs, &c., were passing through the gates without let or hindrance by the police, the motor was refused admittance until Mr. Menzies had interviewed the ground authorities, who reluctantly allowed him to take his car in on payment of 2s. 6d. Other motorists received equally bad treatment.

THE 22-h.p. Daimler which was imported by Mr. Abe Bailey has changed hands, and is now the property of Dr. Jameson.

THE largest elevator in South Africa is that in Garlick's Motor Garage, Fish Lane, Cape Town. It is worked by a 14-h.p. 440 volt motor, and is capable of elevating 7,000 lbs.—3½ Cape tons. Messrs. Garlick expect their 24-h.p. Darracq here next week. This is for Mr. John Garlick's private use. He intends to make use of it during the forthcoming electioneering campaign by touring the Western Province of the Cape Colony. Two of the new Ramblers which this firm have on the water have already been sold, one to Mr. Frank Duffett, and one to Mr. J. Freeman, both of Cape Town. The joint managers of Garlick's Motor and Cycle Supply are Mr. H. Leslie Jenkins and Mr. Wm. M. Jenkins. The latter is practically the pioneer of the motor trade out here, since it was he who first started importing automobiles on a scale worth mentioning.

The "Naylor" Steam Wagon.

THE number of steam wagon builders in the country is steadily increasing; the latest addition to the list is Messrs. Naylor and Co., Limited, of Hereford, whose vehicle is illustrated herewith. The frame is constructed of heavy sectional steel channels, strongly braced together, with transverse T iron gussets and angles, rivetted up with great care, all the rivet holes being drilled. The boiler, which is made to pass the Vulcan Boiler Insurance Company's rules, is of the improved vertical fire-tube type, and is made easily accessible for cleaning purposes. It is fitted with fire box, smoke box, double funnel, patent water gauge, double safety valves, feed pump, injector, and special water lifter coupled to an indiarubber hose with strainer for filling tank as required. The working pressure is 200 lbs. per square inch. The engine is of the compound horizontal reversing type, the cylinders being $3\frac{1}{2}$ in. and $6\frac{1}{2}$ in. diameter by 6 in. stroke, fitted with link motion, and enclosed in a sheet iron casing. The normal speed is 400 revolutions per minute. The cylinders are lagged with non-conducting material, covered with blue steel. The lubrication is arranged on an improved system. Facilities are afforded for obtaining easy access to the working parts of the engine. Two speeds are provided, giving two and six miles per hour. The engine crank shaft is extended in square section, with a double pinion fitted on; this is thrown in and out of gear by a lever working in a quadrant, and as it is impossible to change the gears without stopping the vehicle, an important factor of safety is introduced. These pinions mesh with gear wheels, mounted on the second motion shaft, which runs in long gun metal bearings, bolted to the channel framing, and upon which a chain pinion is fitted. By means of a special chain, capable of standing a working strain of 20 tons, the power is transmitted from the second-motion shaft to the driving axle, which rotates in axle boxes fitted with gun metal bearings. Special radius rods, with lock nuts, are fitted for keeping the chain in the correct adjustment. The back axle, being the driving axle, is made of best mild steel; it is of large diameter, and fitted with a strong set of differential gearing. The axle is coupled up to the road wheels by special bolts and nuts in long gun metal bearings suitably fitted to the axle boxes and secured to the spring. An ingenious arrangement is fitted for locking the differential gearing when necessity occurs. The front axle, of mild steel, has a central turning pivot, thus making a three-point support. The rear road wheels are of the traction engine type, 3 ft.

diameter by 7 in. wide; the front wheels are 2 ft. 6 in. diameter by 5 in. wide. As regards brake power, the link motion can be employed to act as a strong brake and will stop the vehicle under ordinary conditions. A double shoe brake, worked from the driver's seat, and bearing on the tyres of each back wheel, is also provided. A double bunker is arranged in the front part of the vehicle, capable of carrying sufficient fuel for an ordinary day's work. The water tank, of 140 gallons capacity, is secured to the back of the frame, and will carry enough water for 10 to 12 miles without refilling; it is fitted with an improved filter, so that all water is cleansed, thereby considerably increasing the life of the boiler. The standard vehicle, which is constructed to carry a net load of 5 tons, and, with a trailer, an additional 2 tons, is fitted with a lorry or level platform, having a superficial area of 78 square feet, available for carrying goods, and capable of being slightly exceeded. The length is 12 ft. and the width 6 ft. 6 in. Any type of body can, of course, be adapted.

THE junction of the Belfast and Newtownards roads in Abbey Street, Bangor, Co. Down, is regarded as a dangerous spot, and there on Saturday a collision occurred between a motor-car driven by Mr. H. Barbour, of Lisburn, and a jaunting car. The passengers of the latter were severely shaken and the horse was killed.

THE Hozier Engineering Co., Limited, have sent us a photograph of a four-cylinder 16-h.p. "Argyll" car, made to the order of Mr. E. E. Pearson, Brickendonbury, Hertford. The first of this new type was produced in time to compete in the Glasgow to London non-stop trial, through which it went without losing a single mark. The gearing and axle are of the same design as used in the 10-h.p. car, but all parts are strengthened to transmit the increased h.p. The wheel base is 7ft. 6in., and the total weight of the car 16 cwt.

At the Volunteer camp at Gales (Ayrshire) last week the motor-car was found a useful adjunct to the conveyance arrangements. On Wednesday, Mr. R. J. Smith took his car and drove General Sir Arch. Hunter and his staff on his inspection of a sham-fight in which the Highland Light Infantry were engaged. Mr. Thos. M. Macintyre drove them the following day, when similar manoeuvres were undertaken by the Argyll and Sutherland Brigade, and sent his car for the use of Brigadier Rutherford and his officers on several other occasions.

MOTOR-CYCLING NEWS.

On Saturday last the Motor-Cycling Club held the second of the series of 200-mile reliability trials. The route was the same as that taken on the occasion of the first trial. It was divided into three stages, stage one being from Hatfield to Stony Stratford and back, thence on to Hitchin and back to Hatfield, 100½ miles. Stage two, Hatfield to Berkhamstead and back, 51 miles. Stage three, Hatfield to Hertford, thence to Puckeridge, Royston and back to Hatfield, 50 miles. A total entry of twenty-two competitors was received, but only thirteen started. Those that survived the test arrived at Hatfield in the following order:—A. S. Wilson (2½-h.p. Ormonde), Heighton (2½-h.p. Vinco), H. Fairfax (2½-h.p. Werner), B. Holmes (2½-h.p. Vinco), Crundall (2½-h.p. Humber), E. Johnson (2½-h.p. Humber), Watkins (2½-h.p. Excelsior), Clark (2½-h.p. Werner), Cowles (2-h.p. Stockwell). With the exception of Crundall and Johnson all the above made non-stop runs. Watkins, however, missed the right road, and although the distance he covered was greater than the schedule, the question as to whether his ride shall be accepted has to be decided by the committee.

THE Motor-Cycling Club is organising a couple of interesting events for September 12th. The first is a 50-mile non-stop run for motor-bicycles open to members of the Club, while the second is a 100-mile non-stop run for motor-bicycles with fore and side carriages, and trailers, and motor tandem bicycles, each machine to carry the driver and a passenger.

A MOTOR-CYCLE club has just been formed at Frankfurt-am-Main, Germany, with the title Frankfurter Motorrad Club.

THE Southampton County Motor Club is about to organise a 100-mile reliability trial. A handsome silver vase, which has been presented to the club by Messrs. Humber, Limited, will be awarded to the winner.

A NUMBER of motor-cycles are to be experimentally tried in the forthcoming military manoeuvres in Austria.

THE Rex Motor Manufacturing Company are offering a prize of a 3-h.p. motor-bicycle to the rider of a Rex who travels the greatest number of miles during the months of August and September.

THE hill-climbing competition up Mont-Cenis was vetoed by the Italian authorities as far as motor-cars are concerned, but was sanctioned for motor-cycles, and took place last Sunday. There were two classes, namely, racers and tourists, and a large number of entries in both classes. The climb must have been exceedingly stiff, for out of fifty-four starters for the tourist

section only twenty-six reached the winning-post. The course was 23 kilometres long, and the average gradient 1 in 8½. Maffei on a Sarolea (Kerry) machine won the racing class under 50 kilogs., his time being 32 m. 40 sec., equal to 26 miles per hour. Lion on a Turckheimer was first in the racing class over 50 kilogs. (time, 38 m. 47 sec.).

It is reported that an endeavour is being made to spread a report to the effect that the Motor Manufacturing Company, Ltd., have their engines, notably their 2½-h.p. bicycle motors, made in France. Such a statement as this is calculated to injure their reputation, and they ask us to give them an opportunity of stating most emphatically that all their engines, including the well-known 2½-h.p. bicycle motors, are made throughout at their works in Coventry.

Oreste Simonotti on the 2-h.p. Rosselli Motor-Bicycle on which he recently made a 1,600-mile Tour of Italy.

THE German State Railway authorities have lately issued new regulations whereby motor-cycles in charge of their owners can be sent by any train as luggage at ordinary luggage rates, the only proviso being that the fuel tank must be emptied before the machine is given in charge of the railway officials.

THE Clyde Cycle and Motor-Car Company, Limited, have sent us a copy of a new catalogue they have just issued of their "Clyde" motor-bicycles. The list is more than an ordinary catalogue; it is practically a handbook giving full instructions as to the working and manipulation of motor-cycles, one of the useful chapters being that devoted to the magneto ignition fitted on the "Clyde" machines.

AN Austrian motor-cyclist has just made the journey from Vienna to Paris on a Puch motor-bicycle.

A CIRCUIT DE L'HERAULT, reserved for motor-cycles, is to be run off on the 10th inst. The start is to take place at 4 a.m. at Montpellier, the course being from that town to Gignac, Clermont Adge, Meze, Montpellier, and Palavas-les-Hots, a distance of 142 kilometres.

WITH reference to Lord Balfour's suggestion that motor-car lamps should be lessened in size and number, Messrs. Salsbury and Son write:—"The only objection that can be made to the lamps at present used on motor-cars is their glare when seen by persons approaching them, and this would be entirely obviated if motorists would have shades fitted to the large acetylene lamps such as we make, which would have the effect of throwing the light upon the road, where in reality it is most required. Besides this shade we have now fitted an adjustable burner to our acetylene lamps, by means of which the flame can be regulated from the largest size to extinction when travelling through towns, and these two things we contend would meet all purposes."

HERE AND THERE.

A MOTOR LAUNCH has been built at Greenock for Mr. J. C. McKellar, of Glasgow.

THE Wolseley Company have just supplied a 20-h.p. car to the Duke of Devonshire.

THE Avon Motor Manufacturing Co., Ltd., has been registered with a capital of £10,000.

TO-DAY (Saturday) the members of the Kent Automobile Club will hold a run to Folkestone.

It is proposed to provide the police and fire departments of St. Louis with motor-cars to be used during the St. Louis International Exhibition.

FOR giving an incorrect name and address, a motor-car driver, named David Edwards, of Beckenham, has been fined £2 10s. by the St. Neot's magistrates.

MR. F. M. WILLIAMS, of Pasadena, California, has started on an Oldsmobile on an attempt to make the transcontinental journey from San Francisco to New York.

THE Morse Chain Co., of Trumansburg, N.Y., U.S.A., have sent us a copy of the catalogue of their high-speed silent running chains as used on the Haynes-Apperson motor-cars.

THE Co. Kildare Agricultural and Technical Instruction Committee has sanctioned a travelling scale arrangement of 2d. per mile to its horticultural instructor, who employs a motor-bicycle in his travels.

SOME confusion having arisen as to the Lanchester car and the Lancaster Motor Garage, we are requested to state that the Lanchester Engine Company, Limited, and the Lancaster Motor Garage are in no way connected with each other.

THE Scottish Motor Manufacturers and Traders' Association executive are considering questions relating to drivers and wages, terms for learners, repairs in workshop and at a distance, guarantee, etc. Mr. T. M. Sleight is the Secretary of the Association.

A CHICAGO motorist was recently stranded with his car in the desert of Utah owing to his supply of petrol being exhausted. Leaving his companion to guard the car, he had to walk twenty-two miles to the nearest railway station to get a fresh supply of spirit.

MONMOUTH, Abergavenny, Usk and Tintern are to be visited by the Cheltenham and Gloucester Automobile Club to-day (Saturday), and on Bank Holiday. A general meeting of the Club will be held on Tuesday next at the Queen's Hotel, Cheltenham.

THE Brailes, Shipston-on-Stour and Stratford-on-Avon Steam Omnibus Company, Limited, has been registered with a capital of £2,000 to acquire and deal in vehicles drawn by mechanical means or otherwise. The registered office is at Church Street, Shipston-on-Stour.

A SPECIAL meeting of the Council of the Central and Associated Chambers of Agriculture was held in London last week, when Mr. Baldwin Latham moved a resolution declaring that any Bill regulating the motor-car traffic could not be accepted as satisfactory unless the maximum speed limit be universally defined, and contended that the Bill which had been introduced into the House of Lords did not go far enough. This was adopted by the meeting.

THE British Consul at Rome, in his recently issued report, remarks that motor-cars are superseding the ordinary means of conveyance in the Italian capital. The only difficulty which seems to retard the general adoption of this more modern and expeditious system of locomotion is the high price of the machines. Up to the present motor-cars have been mainly supplied by France, Belgium, and Germany; but if a fairly good British car could be placed on the market, costing not more than what is now paid for the same article originating from the above countries, a permanent market might be secured.

AN automobile club has been formed at Salt Lake City, Utah.

THE Eastbourne Corporation is experimenting with a motor water cart.

SOME trials with a Durkopp car are being made by the post-office authorities at Bielefeld, Germany.

AN attractive picture poster has been issued by the Motor Manufacturing Co., Limited, which should find a permanent place on garage walls throughout the country.

THE Wolverhampton and District Automobile Club will hold a run to Shrewsbury to-day (Saturday). Some of the members will spend the week-end at Llangollen.

THE Pirrie-Iveagh motor transit scheme is now being seriously put in hand, and three commissioners are travelling in Ireland considering the suitability of certain districts for motor-car services, particularly for goods traffic.

LAST week the Duke of Atholl and the Marquis of Tullibardine arrived at Chapel-en-le-Frith and were the guests for the night of Mr. Bagshawe, J.P., D.L., at Ford Hall. They travelled by motor-car, and left the day after for Perth.

MR. EDGAR SMITH, of Halifax, has removed his garage to premises on the opposite side of Northgate to those which he has previously occupied. Accommodation is now available for twenty cars and every facility provided for the execution of repairs.

The Electric Brougham supplied by the City and Suburban Electric Carriage Company to the Prince of Wales.

MR. H. N. WATSON, of the North Road Motor and Accessories Agency, Tuxford, Notts, now supplies Pratt's motor spirit. His place is on the Great North Road, so that motorists in the district need not turn from the direct road in obtaining replenishment of petrol.

"ACROSS Sumatra in a Motor-Car" is the title of an interesting article in the current number of the "Wide-World Magazine." The alarm of the natives was natural, but the car brought the travellers safely through, and added another testimonial to the value of the automobile in otherwise inaccessible districts.

FROM a British Columbia journal we learn that among the contestants in the Gordon Bennett race was R. Deknyff, and that "in outline the course somewhat resembles a map of Africa, traversely divided into two parts, which are known as the major and the minor loop. At 7 o'clock to a second, Jorlloyd, the starter, fired a pistol, Edge pressed the lever of his car, and the vehicle sprang forward and the race began amid cheers." A telegram reaching our Colonial contemporary at 5.13 p.m. on the day of the race was recorded as follows: "A special dispatch from Ballyshannon says that Genatzky's and Gabriel's cars collided at Maryborough and that several persons were injured." The finish is thus summed up. "Deknyff finished first at 5.34 p.m., and Genatzky second at 5.36 p.m. Fairman also finished."

HEREWITH we illustrate a new sparking plug which has been put on the market by the Pyrokrat Electrical Company, of Farm Street, Birmingham. The feature of the "Pyro" plug, as it is known, is the special arrangement provided to enable the ignition wire to be easily connected and disconnected. As will be seen, instead of the connection being made by a nut, a spring clip is used to attach the wire; the lever is simply raised, the ends of the wire inserted and the lever depressed. The plug is supplied with

either porcelain or mica body; each have their advantages and disadvantages; mica, of course, will not break or crack, but is more liable than porcelain to short circuit. Porcelain is a better non-conductor; it can be taken out, cleaned, and replaced, but if broken it must be replaced by a new one. An alternative form of the "Pyro" plug is also being put on the market in which a neat spark intensifier is incorporated.

AMONG other subjects discussed at the conference of Scottish Road Surveyors, held in Dumfries, was the effect of motor-car traffic on roads. This traffic, it was generally said, was more injurious than that of the ordinary vehicles.

THE tyres of the Duke of Connaught's motor-car were punctured the other morning, the mischief being discovered too late to enable him to reach a review in Phoenix Park, Dublin, by his own car. Mr. M. T. Woods, of Newbridge, however, placed his new Darracq at the disposal of His Royal Highness, who reached Dublin in good time.

THE handy Hotel Guide comes to us in a convenient form from the Hotel and General Advertising Co., Ltd. A new feature has been introduced, particulars being given of accommodation for motor-cars at the leading hotels in the country. A casual glance reveals the fact that hotel proprietors are rightly recognising the part motorists are certain to play in their future prosperity.

THE Veeder Co. have lately brought out a new pattern of their well-known cyclometers or odometers for use on large motor-cars. The instrument, as will be seen from the accompanying full size illustration, is small and neat; it is easily fitted to almost any kind of under carriage, and when once fitted requires no further attention or trouble, doing its work quietly and regularly, and recording the mileage by quarters covered until

10,000 miles are reached, when it will reset itself back to zero. Since the farther the odometer is placed from the axle the harder will be the blow given by the striking roll, it is desirable that the centre of the odometer be not more than 2 inches from the centre of the axle, and should in no case be more than 2 1-2 inches. The instrument is being introduced into this country by Messrs. Markt and Co.

A PUBLIC motor-car service has just been started between Havre and Etretat.

L'AUTOMOBILE CLUB JURASSIEN has just been formed at Lons-le-Saunier, France.

THE Wurttemberg Automobile Club held a dinner on the 21st ult. in celebration of the victory of Germany in the Gordon Bennett Cup race.

THE Rhodesian Department of Agriculture has offered a prize of £1,000 for the best motor plough, and a competition will be arranged for the purpose.

THE Leeds Corporation Tramways Department have purchased a 12-h.p. Clement car through the local agents, the Northern Motor Co., for the use of their tramway inspector and manager.

AT Dublin Police Court Mr. Richard O'Callaghan, of Swords, has been remanded on bail on a charge of causing the death of a boy cyclist in Phoenix Park, Dublin, by knocking him down with a motor-car.

THE Eclipse Motor and Cycle Company, of John Bright Street, Birmingham, have recently introduced the ingenious terminal clip for connecting the ignition wires to accumulators, coils, and sparking plugs, illustrated herewith. The clip can be attached or removed in a second, and cannot work loose through vibration like the ordinary nut or screw fastening. To fix the terminal to the clip the wire should be passed through the two

holes provided in the shank, and doubled over, a little insulation tape being then wrapped over the shank. The end of the clip which fits on the plug or terminal is made of two parts, one sliding within the other, with a spring action. When the ends are pressed together, as shown herewith, the holes in the two parts coincide with each other, allowing the clip to be fixed on the rod of the plug or battery terminal. On releasing the pressure, the two parts tend, owing to the spring, to separate, so pinching the rod firmly and making a connection which cannot work loose.

At the Doncaster West Riding Police Court, Walter Crabtree, surveyor to the Doncaster Rural District Council, has been fined 20s., including costs, for obstructing the road at Conisbro' by placing a quantity of stone there which was required for the roads.

THE British Motor Fittings Co., of John Bright Street, Birmingham, have sent us copies of a series of circulars they have issued illustrating their 7 and 10-h.p. double-cylinder petrol motors, change-speed gears, pumps, live axles, steering gears, and other motor-car parts.

THE West Ham coroner has held an inquiry into the death of James Adams, of Larch Road, Cricklewood, who was thrown from a motor-cycle on the Memorial Sports Ground, Canning Town. Adams was trying a motor-cycle which had won a speed trial in Ireland. On the third lap he lost control at a corner and was thrown up the slope and hurled against the fence. Mr. Arthur Goodwin, of the Ormonde Company, put the pace up to sixty-five miles an hour. Nominally the machine was of 3 1/2-h.p., but at 2,000 revolutions it would be 4-h.p. The jury found death to be accidental.

CORRESPONDENCE.

THE HORSE POWER OF PETROL MOTORS.

TO THE EDITOR OF THE *Motor-Car Journal*.

SIR,—As you ask for opinions on the above subject, may we say we think you do well in bringing it forward? The matter certainly *does* require putting on a uniform basis, for, as things are at present, they are not only very puzzling but most misleading to the public who purchase cars. As you say, it is the custom of most reputable firms to denominate their motors either well within their maximum powers—i.e., “all out” both as to speed and ignition—or to call them whatever they give on the brake at their normal, or governed, speed, which comes to the same thing, as, with the governor out of action, they will usually develop much more. On the other hand, other firms do just the reverse and designate their motors either by purely arbitrary figures or by the brake horse-power developed for a few minutes under conditions and speeds which practically never obtain in actual use upon a car. It is an undoubted fact that a large number of buyers are unable to appreciate the real point at issue and purchase their cars almost entirely upon “listed” horse-power, taking much more kindly, for instance, to a single-cylinder car of a nominal 8—which, perhaps, much more nearly reaches 5 in actual practice—than to a substantial two-cylinder 6, which will perhaps touch 9 on being pushed, and will pay as high or a higher price for it.

If the public were more thoroughly *au fait* with motor matters these sharp practices—for they are nothing less—would soon cease to be carried on, as, in the long run, they defeat their own ends, although where “present sales” are the only point in view they are only too successful. In our estimation the only sound principle is to denominate the motor according to its showing on the brake at its normal—or, in the case of governed motors, governed—speed rate, and this speed rate should be stated. In our practice we guarantee every motor to give a full and absolute 10-h.p. upon the brake at 700 revolutions, under ordinary conditions of running, and that we do get the power we claim, whereas others apparently do not—unless a much larger proportion of their power is absorbed in their transmission gear—is, we think, amply proved by the relative performance of our car with others in the Phoenix Park speed trials and Castlewellan hill tests. Were it not for the difficulty of testing, we should sell our cars on the *horse-power delivered at the wheels*, which we believe to be the only true system; for, after all, the automobilist is not buying an engine, but a car complete, and it is horse-power at the wheels he wants, when all is said and done.—Yours truly,

THE DURYEA MOTOR-CARRIAGE COMPANY.

TO THE EDITOR OF THE *Motor-Car Journal*.

SIR,—We have read with great interest your article on the horse-power of petrol motors. We certainly think it would be more satisfactory for the public if manufacturers would agree to some standard. We ourselves test our engines in what we consider a most satisfactory way. We consider that brake horse-power is the only test worth having, so we make this test at the normal number of revolutions of the engine, e.g., in the case of our four-cylinder 10-h.p. engine, at 1,000 revolutions per minute. Now the brake horse-power of this comes out between 16 and 17-h.p., and it must be borne in mind that the engine is perfectly new, never having been run before. Undoubtedly if one of these engines were removed from the car after two months' use a considerable increase in brake horse-power would be registered. Although we take the normal speed, it must be understood that there is still a margin for extra power, as our engines will run up to well over 1,200 revolutions per minute.—Yours truly,

THE STAR ENGINEERING COMPANY.

SECOND-HAND CARS.

TO THE EDITOR OF THE *Motor-Car Journal*.

SIR,—May I call the attention of buyers to the fact that cars are advertised that are very far from the statements made in the advertisement. Having been put to a lot of expense for an expert and travelling expenses, I advise buyers to have an undertaking that these expenses should be met by the advertiser if the car is not in accordance with the particulars given.—Yours truly,

CAMDEN.

THROWING STICKS AT CARS.

TO THE EDITOR OF THE *Motor-Car Journal*.

SIR,—Our client, Mr. R. F. Dickerson, was summoned for driving a motor-car in excess of the regulation speed, and a policeman having sworn that, according to his estimate, he was going between forty and fifty miles an hour, he was fined £10 and costs. We wish to give the facts relating to another part of the case.

An elderly man named Mr. Robinson was standing on the pavement when the motor-car went by, and threw a stick at our client with great force. Fortunately it missed Mr. Dickerson, or it might have seriously injured him, but it struck the back of the car so violently that the stick broke in two and damage was done to the car which will cost £5 to repair. We applied for a summons for assault, but Mr. Curtis

Bennett did not think it was an assault to throw a stick at a motor-car driver, but ultimately consented to grant a summons for the damage to the car. When the summons came on for hearing Robinson admitted throwing the stick, and practically admitted the damage, but swore that he did it in the public interest in order to stop the motor-car, and Mr. Curtis Bennett decided that it was not done wilfully with intent to damage the car, and the result of this decision is that anyone may throw anything he likes at a motor-car driver.—Yours truly,

GREVILLE AND CO.

A RUN TO THE LAKES.

TO THE EDITOR OF THE *Motor-Car Journal*.

SIR,—Below I am sending you particulars of a most enjoyable trip up to the Lake District, which I, in company with my wife and Mrs. E. W. Cathie, have just taken. Of course we had a fair amount of luggage. My car is an 8-h.p. M.M.C., and I had never before dreamed it would be possible for a car with single cylinder engine to do what this one has done.

I have been most careful to keep a strict record of the petrol, etc. used, and the following is a list of my expenses on the road in respect of the car. Petrol, 44 gallons, or 32.16 miles to the gallon; oil, 2 gallons; accumulators charged twice; 2 lbs. grease; one inlet valve stem; one pin in timing gear.

I am sure you will agree with me that the running cost is exceedingly reasonable, especially as some of the hills round the lakes had gradients of 1 in 6, and 1 in 7.—Yours faithfully,

CECIL G. CATHIE.

THE IRISH FORTNIGHT.

TO THE EDITOR OF THE *Motor-Car Journal*.

SIR,—I notice in the report of the Killorglin Trials that it is stated that I did not run the 20-h.p. Humber car in the final, as it was not in running order. I should like briefly to point out the facts of the case. After running the first heat I was told that another car had done faster time than mine, and that it would not, therefore, be necessary for me to run again. Consequently I started to make an adjustment to one of the inlet valves which I thought had been sticking slightly. Just after I had started to do this I was told that a mistake had been made, and my car was the one which should have run in the second heat. Needless to say I was unable to do so, with the result that another car was sent up the hill. Had no mistake occurred as to which car had done the fastest time in the Tourist class, I should have been able to run in this, when doubtless I should again have shown the fastest time for touring cars.—Yours faithfully,

J. W. CROSS.

CLUB NEWS.

SHEFFIELD AND DISTRICT.

A SPECIAL general meeting of the members of this club was held at the Wharfedale Hotel, Sheffield. Mr. Horace Cawood occupied the chair, and the others present included Messrs. H. Cooper, B. Hind, C. Harlow, J. Ellis, W. H. Brown, Percy Thompson, S. Walling, W. Coldwell, James Barber, J. Walker, H. E. Mallinder, G. D. Flather, J. T. Thompson, F. B. Cawood, and W. Gilder. Mr. B. H. Foster wrote resigning the

presidency of the club, but a resolution was passed asking him to reconsider the matter. Mr. J. R. Wade tendered his resignation of the office of secretary, which was accepted with regret, and a hearty vote of thanks was accorded to him for his past services. Mr. F. B. Cawood was elected the new hon. secretary. Medals and cups were presented to the winners of the recent hill-climbing competition—Mr. Cooper for the car part of the contest, and Mr. W. H. Brown for the cycle section. A design for a badge was adopted. It was decided not to affiliate with the Automobile Club of Great Britain and Ireland. The Motor-Car Bill was discussed, and a resolution objecting to the licensing of private drivers was carried.

LINCOLNSHIRE.

A VERY successful meet of the Lincolnshire Automobile Club has been held at Asgarby Hall, the club having been invited there by Mr. G. Godson. Among those present were Mr. C. W. Pennell, Lincoln, on a 12-h.p. Richardson; Mr. W. R. Pennell, Lincoln, Locomobile; Mr. J. M. Goy, Lincoln, Baby Peugeot; Dr. Benson, Pick; Mr. G. Linnell, Deeping, 10-h.p. Wolseley; Mr. J. H. Carter, Mr. S. Gilbert, Billingham, and Mr. S. W. Ayre, motor-bicycles; Mr. E. Cragg, hon. secretary, and Mrs. Cragg, Enfield quad; Mr. R. M. Wright, Lincoln, 10-h.p. Lanchester; Mr. J. Coombes, Lincoln, 9-h.p. De Dion; Mr. C. Nelson, hon. solicitor, De Dion; and Mr. J. Richardson, Lincoln, 12-h.p. Richardson. The weather was fine, and there was a pleasurable absence of dust. Tea was partaken of on the lawn, and some fifty friends were present to meet the club. The gathering was even more popular and successful than on the visit of the club to Mr. Godson's last year.

THE club has also had a run to Beechfield, Grimsby, on the invitation of Major Errington Josse. Major Josse is an enthusiastic motorist, the owner of a Bardon car, and the programme embraced a visit in the first instance to their host's residence in Augusta Street, Grimsby, where the cars commenced to arrive soon after noon. An hour later luncheon was

Photo by) [Mr. H. Prosser on his 24-h.p. De Dietrich Car. (Mr. Archd. Stevenson

served at the Royal Hotel. As the cars were driven down to the hotel, via Victoria Street, they created no little excitement, the ease with which they were steered between the traffic being very noticeable. The Major's guests alighted at the front entrance to the hotel, and the cars were then marshalled at the rear. The thanks of the guests were voiced by Messrs. Cragg and Jevon and duly acknowledged by the host.

YORKSHIRE.

THE Committee of the Yorkshire Club have made arrangements for the East Coast Camp recently referred to in our columns, and although the definite location of the camp was late in being decided, it will be between Scarborough and Bridlington, and directly on the coast. Tents will be erected and ready for occupation to-day (Saturday), and dinner will be served at 7 p.m. Breakfast, lunch, and dinner will be served each day, and afternoon tea may be ordered if required. It is proposed to break up the camp on Wednesday next after lunch. Sleeping accommodation is provided in bell tents, and only four in one tent. Palliasses and blankets will be supplied. Members wishing to take their wives may have a special tent reserved for their use. The cost of the trip, including meals and tents, will be, approximately, £3 10s. each.

KENT.

THE members of the Kent Automobile Club had a most delightful picnic on Saturday last at Hothfield Common, the weather being very favourable. The meet was largely attended by members and their friends. The thanks of the club are due to Mr. Langley, the master of Charing Union, who kindly allowed the members of the club to leave their cars in his grounds. On August 8th, Mr. and Mrs. Bernard Arnold

are kindly entertaining the members and their friends to a picnic tea on their island in the Medway at Snoll Hatch, East Peckham, Kent.

LEICESTERSHIRE.

M^{RS} MEMBERS of the Leicestershire Automobile Club had an enjoyable run to Matlock Bath and back on Saturday. A start was made from the Bell Hotel, Leicester, at 10 30 a.m., and the journey lay through Mountsorrel, Quorn, Loughborough, Hathern, Kegworth, Shardlow, Elvaston, Derby, Ambergate, and Cromford. Matlock was reached in time for lunch, which was partaken of at the new Bath Hotel, twenty-four sitting down. The fine weather continued throughout the afternoon, and much pleasure was derived from a stroll about Matlock. Tea was provided at the Bath Hotel at five o'clock. During the visit the party struck a motoring attitude, in which they were photographed by a local artist. The return run was commenced at 6.30, and was safely accomplished without any breakdown. The party consisted of Mr. Mawbey (president) and Mrs. Mawbey, Mr. H. King, (vice-president) and Mrs. King, Mr. Maurice and Miss Mawbey, Mr. and Mrs. Harding and family, Dr. Corcoran (Loughborough), Mrs. and Miss McAlpin, Mr. R. E. Parker, Mr. and Mrs. Peberdy, Mr. Binns, Mr. A. McAlpin, hon. secretary, and others.

WOLVERHAMPTON.

ABOUT twenty members of the Wolverhampton and District Automobile Club have met at their clubroom for the purpose of making a presentation to Mr. Trevor Young upon the occasion of his marriage with Miss Lillian Davies. Mr. S. R. Rhodes, the hon. secretary, after referring to Mr. Young being one of the founders of the Club and to his having very materially assisted in its prosperity, and to his devotion to the pastime of motoring, expressed pleasure in asking him to accept from the members a solid silver cigar and cigarette cabinet, bearing the Club's badge and suitably inscribed, and also in presenting to his bride a silver-mounted mirror as a slight acknowledgment of the services he had rendered to the Club, and as an expression of the Club's goodwill toward him. Mr. Young, in accepting the gifts, said words could not adequately express his feelings at the generous manner in which the presentation had been made, but he could assure the Club that both he and his bride would prize most highly the presents. His connection with the Club had been of the most pleasant character, and he fully appreciated the kindly feelings which had been expressed toward him. After the presentation, although the hour was late, the members drove to Albrighton.

CLAIM FOR DAMAGES.

IN the Glasgow Court of Session, the Lord President and a jury tried the action in which Archibald Paterson, Glasgow, sued William Beardmore, Parkhead Rolling Mills, Glasgow, for £500 damages, in respect of bodily injuries received by the pursuer's son, Thomas Stewart Paterson, six years of age, who, on the afternoon of Friday, January 24th, 1902, was knocked down by a motor-car belonging to the defendant and driven by his servant. The pursuer averred that the car was being driven at a dangerous rate of speed, that the driver did not have it within his control, and that he was not keeping a lookout, and gave no warning. The defender denied that his servant was at fault. The jury found for the pursuer, and assessed the damages at £300.

ASSAULT ON A MOTORIST.

WE recently gave publicity to an assault on Mr. F. Morris, which he duly reported to the Norfolk Automobile Club, and they in their turn referred the case to the Motor Union. The Motor Union, regarding the matter of considerable importance, undertook to bear the cost of the prosecution, and placed the matter in the hands of Messrs. Mills and Reeve, solicitors, of Norwich. The case was heard at Downham Market Petty Sessions, when the defendant was fined 36s. inclusive, or, in default, a month's imprisonment.

POLICE TRAPS.

DURHAM DOWNS, Bristol, are now being watched by the police, who are especially in quest of motor-cyclists passing that way.

ALL motorists going into Southamptton should look out for a police trap in the Avenue, about two miles from the Bargate. There is also another on the road to the New Forest, close to Millbrook Station, two miles to the west of the town, and another between the top of Hunter's Hill and Lyndhurst Road Station. There are no police actually on the hill, time being taken from first sight of car by a man near the station. Would it not be well for all motorists (writes a "victim" who sends this information), after discovering a trap, to give information at their next stopping place, and also enquire as to traps in the direction they are travelling.

THERE is a new police trap in the middle of the village of Aston Clinton, midway between Tring and Aylesbury, and four miles from either town. It worked the first time on Sunday week, the editor of a motoring contemporary being the pioneer victim.

THE police in the Windsor district are laying traps in many hitherto unsuspected places. Among the measured distances that have proved expensive to motorists lately are pieces of road near Sir Daniel Gooch's place at Clewer Park.

ON race days at Salisbury the police have measured distances near Wallop, on the main road leading from Andover to Salisbury.

Where no alleged speed is given it is understood to be above the legal limit.

MR. STAPLEE FIRTH defended the driver of Sir W. Pearce's car at Winchester. The constable said that although he was a quarter of a mile off he was able to see the telegraph poles, and to time the car over 200 yards in 25 seconds, equal to 18 miles an hour.—Payne, Sir W. Pearce, and Colonel Moore swore distinctly that the hill, the most dangerous between London and Southampton, necessitated very slow speed, especially in the condition it then was, and the speed down hill ranged from nine miles to six miles an hour, and as they had to turn into Kiln Lane to go to Brambridge, and the road was recently "up," slowness was a necessity. The distances were put at 307 yards instead of 220.—The case was dismissed.

AT the Woking County Sessions, on Saturday, the Earl of Ilchester was summoned for driving a motor-car at excessive speed. His lordship pleaded not guilty. Sergeant Jarrett said that when he stopped the car the driver attempted to get away. Witness, who was on his bicycle, dismounted and clung to the back of the car, and was carried along for some distance. The name of the driver was refused, and witness subsequently called on his lordship at Holland House. The defendant on Saturday asked the magistrate to adjourn the case for the attendance of a lady witness from Ireland, and mentioned that he stopped the car directly he was asked to do so, and offered to take the witness with him to London in order to prove his identity. His lordship said the sergeant's account of the conversation was totally unreliable. He was given no proof that the witness, who wore plain clothes was a policeman; he showed him no card or anything else. The case was adjourned.

ABOUT £20 in fines has been exacted by the Norman Cross (Huntingdonshire) magistrates from motorists travelling at over 20 miles an hour.

THE Justices of the Andover Petty Sessional Division of the county of Hants have heard summonses preferred against several gentlemen driving motor-cars on the highway at a speed of over twelve miles an hour on July 7th, 8th, and 9th, in going to the Bibury Club races, held at Salisbury. The first defendant was Sidney Fleming, driver to Mr. J. G. Bulteel, of Sefton Park, Slough, who was riding in the car, there being two summonses against him, one for July 8th and the other for July 9th. Defendant was ordered to pay £7 and 15s. costs. The summons for a similar offence on July 9th was withdrawn on payment of costs.—The Earl of Carnarvon, of Highclere Park, Newbury, was proceeded against for driving his car beyond the regulation twelve miles an hour on July 7th and 8th. On July 7th the police timed his lordship's car for a measured mile, which was covered in 2 min. 4 sec., or at the rate of 29 miles an hour. When signalled to stop he turned the car down a side road, and dashed through a farmyard and river in the village of Wallop. On July 8th the Earl again went to the Bibury races, when the rate of speed was over 24 miles an hour. There was no defence, and Superintendent Bowles having put in a list of four previous convictions for similar offences against Lord Carnarvon, the justices now fined him the full penalty of £10 and 11s. costs in each case, or £21 2s. in all.—Harold Cross, driver to the Earl of Carnarvon, appeared to two summonses, and pleaded guilty. He was fined £5 and 9s. costs on the first summons, the second being withdrawn on payment of costs.—Kempton Cannon, jockey, of Stockbridge, Hants, was fined £7 and costs for a similar offence, committed on July 8th.

FATALITY AT BRIXTON.

MRS. MARIA GREYSTOCK, fifty-five, was knocked down by a motor-car in Brixton, S.W., recently, and expired a few hours later. At the inquest the owner and driver of the motor, Mr. Walter Watson, who said he was a stockbroker of New York, stated that when the accident happened he was

coming from Newhaven. The deceased stepped in front of the car. He did all he could to prevent the accident. Answering a jurymen, witness said he was an expert driver, and had passed an examination by the French police. He was travelling about six miles an hour when the accident happened. The medical evidence showed deceased died from shock, following fracture of the spine and internal injuries. A verdict of "Accidental death" was returned.

QUARTERLY HUNDRED MILES TRIAL OF THE A.C.G.B.I.

The Quarterly Hundred Miles Trial was held on Friday, the 24th ult., when there were four competitors.

The James and Browne (9-h.p.) weighed without passengers 19 cwt. 14 lb., and with passengers 24 cwt. 1 qr. 12½ lb., and consumed 3 gal. 2 qt. of spirit on the journey, giving a cost of 525d. per mile. The speed both on the outward and return journey was up to the legal limit. The speed on the steep portion of Dashwood Hill was 7.42 miles per hour, and on the mile including Dashwood Hill 9.04 m.p.h. The speed on Aston Hill was 10.2 m.p.h. Mr. R. W. Sprague, who acted as Honorary Observer, reports: "Two stops; both caused by tyre troubles. Cause: (1) Inner tube nipped; (2) inner tube gave at join."

The Brooke car (14 h.p.) weighed 22 cwt. 2 qr. 25½ lb. without passengers, and 28 cwt. 1 qr. 27 lb. with passengers. The fuel used on the journey was 5 gal. 2 qt., giving a cost of 825d. per mile. The speed

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

A 12-h.p. Clement Car, fitted with Special Coupe Body by Messrs. J. Rothschild et Fils, Ltd.

both outward and return was up to the legal limit. The speed on the steep portion of Dashwood Hill was 6.45 m.p.h., on the mile including Dashwood Hill 8 m.p.h., and on Aston Hill was 9.11 m.p.h. Mr. T. MacNeill, who acted as Honorary Observer, reports: "Car ran particularly well. She only worked on two cylinders from the 32nd milestone to 34th, during which time Dashwood Hill had to be negotiated. It was an absolutely non-stop run."

The Ariel car (12-h.p.) weighed 19 cwt. 1 qr. 24 lb. without passengers and 25 cwt. 11 lb. with passengers, and consumed 5 gal. 1 qt. 1 pt. 13 oz. of spirit, giving a cost of 81d. per mile. The speed both on the outward and return journey was up to the legal limit. The speed on the steep portion of Dashwood Hill was 12 m.p.h., on the mile including Dashwood Hill 14.51 m.p.h., and on Aston Hill 15.58 m.p.h. Mr. E. de Wilton, who acted as Honorary Observer, reports: One stop on Notting Hill for burst tyre, 23 min."

Owing to innumerable tyre troubles the Lanchester car (10-h.p.) discontinued the run at Dashwood Hill.

ALLEGED REFUSAL TO STOP.

BEFORE the Banbury County Bench, W. L. Creyke, Oxford, was summoned for refusing to stop his motor-car when requested by James Slatter, he having a restive horse, at Adderbury, on the 18th of June. Mr. Walsh, who appeared for the defendant, pleaded not guilty, and secured the adjournment of the case for a month for the arrival of witnesses now abroad.

THE Motor-Car Journal.

VOL. V.]

LONDON, SATURDAY, AUGUST 8, 1903.

[No. 231.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

TUESDAY'S discussion in the House of Commons was a revelation of strength and weakness that must have caused motorists to rub their eyes when they read the reports on Wednesday morning. Representatives of agricultural districts discoursed on the enormity of the suggestion with regard to the withdrawal of the speed limit, and even the spokesmen of motorists proved lukewarm advocates. There was an air of compromise about that boded ill for any final settlement, and we could have wished that more energy had been infused into the matter. Now that the question of the speed limit has been raised, nothing else but its abolition will be satisfactory, and automobilists in Parliament will not be serving their fellow motorists unless they are strong on this point.

No Confidence.

FRANKLY we confess that we do not like the Motor-Car Bill which the Government has introduced. The chances of appeal are not sufficient, for, it must be confessed, the likelihood of universal fair play to motorists is somewhat remote. A study of our reports of furious driving cases, supplemented by a perusal of discussions at local councils, and the harangues of magistrates on so-called judicial benches, is enough to convince any thinking person of the impossibility of securing justice. Even a bad law can be tolerated if administered with discretion; but for motorists to expect justice in the present state of public opinion is something scarcely imaginable.

More Fight Wanted.

IN quietly deciding to accept the Bill the Parliamentary automobile party showed a calmness which was not courageous. Obvious injustices are being placed upon the statute book and yet they are accepted without strenuous efforts being made to minimise their hardship. It is said that the whole Bill will be in jeopardy if full discussion is permitted. The attitude of anti-motorists in thus sullenly awaiting the executioner of their pet aversion can be understood; but not so that of the motorists who merely say "We will take the Bill because there is no other course." This is not the spirit in which difficulties should be met, and if proper insistence were made on the meagre chances of appeal provided in the measure a better prospect would have been in store for motorists.

In Jeopardy.

IT must now be clear to the veriest Parliamentary tyro that all the fuss and pother of the last few years has really damaged the motorists' position in the eyes of the country. It is to be hoped that it will not be entirely jeopardised by recent tactics. The Bill as sent from the Lords was bad for motorists, but as Mr. Long has conceded the speed limit, its effect will be really worse than was the older legislation. Higher

penalties will now be enforceable, and no advantage gained by the motorist. This will operate most hardly on the man of moderate means, while it will ultimately prove wearisome to the richer class of owners.

Let Well Alone.

UNLESS the speed limit, with all its vexatious accompaniments of police traps, is abolished the Bill should be opposed. That seems the one logical attitude for motorists in Parliament to assume. Otherwise the only result of the agitation they have fostered will be that their friends will be subjected to higher penalties, numbered like auction lots, licensed like cabbies, and liable, for Mr. Long's backbone is pliable before stout opponents, to be thrown into prison. And all because the impetuosity of young enthusiasts could not "let well alone."

Against the Motorist.

MR. MONTAGU himself wrote before Mr. Long climbed down that the advantages of the Bill to the motorist consisted in the abolition of the speed limit and a slight raising of the tare limit for slow traffic. The latter is a valuable industrial concession which we appreciate, but does not affect the tourist or the ordinary man any more than the conditions prevailing in Ireland during the Gordon Bennett week are to be instanced as normal ones. Now that the speed limit is to be re-enforced, and possibly reduced, there is nothing left to the motorist but the new provisions, and Mr. Montagu admits that there are half a dozen innovatory restrictions in "the interests of the public"—a neat phrase which really means against the convenience of the motorist.

Time on our Side.

THE chairman of the Tunbridge Wells Farmers' Club took the right line at the last meeting of his association, when he hoped the Motor-Car Bill would not pass, as in a few years "they would all be motorists." Time is on our side, and it is a pity that by premature agitation some misguided motorists brought about the present legislative position. Had they waited a few months, or two or three years at most, there would have been a majority of motorists in both Houses of Parliament, with the result that the discussions would have had a more practical tone, and the whole position made distinctly clearer to the public.

A Somersault.

MR. WALTER LONG has surprised everybody by his somersault. Only a few days ago he was advising the Chamber of Agriculture that it was impossible to enforce a speed limit; now he has consented to such an absurdity being included in his Bill. Originally amateur drivers were to be treated as ordinary gentlemen; then it was agreed that they should be licensed on payment of a fee; now the licence certificate will only be granted after a test of efficiency. The vagaries of the motor-car of 1896 were as nothing to the vacillations of the modern motor

statesman, whose dislike of settled convictions is as pronounced as the ordinary J.P.'s partiality for such cases.

The Right Position.

PROBABLY the most reasonable view of the matter which has appeared in the daily press is that of the "Morning Advertiser." "Our own view of this motor question is," says our contemporary, "that the best plan would be to treat motor-cars exactly as we treat horse-drawn carriages. They should be subject to the ordinary law of furious driving. It is much easier to decide whether a vehicle is being driven to the danger of the public than to make up one's mind off-hand whether it is going at a greater rate than 20 miles an hour. Any limit is bound to perpetuate the bad system of police spies and motor traps, which leads to continual conflict of evidence and much bad feeling. Far better would it be to trust to policemen and the public alike to say whether a motor-car was being driven to the common danger and to impose no limits of any kind whatever. If a speed limit should be insisted upon, then it would be the wisest course to refuse to license any motor for road use which is capable of going at more than a certain number of miles an hour."

The First Run of the Eastern Provinces Automobile Association.

The Logical Conclusion.

THIS latter suggestion is really the logical conclusion of the adoption of the speed limit, and its restrictive influence is apparent at once. It will stifle the industry, destroy initiative on the part of inventors, and generally reduce a promising trade to a dull dead level of decadence. In fact, at a time when the motto of the country is "Wake up, England!" to suggest a penalisation of its activities is a course that cannot commend itself to patriotic people. It savours of the narrow spirit that too frequently has prevailed to the disadvantage of the general welfare, and we would urge all interested in the automobile industry to make it clear to their Parliamentary representatives that votes given against the abolition of the speed limit will be really given against the national prosperity. Urgent and strong action is needed to prevent such a scandal being committed in the House of Commons.

The Right of Appeal.

AMONG the peculiarities of the Bill was the right of appeal granted to those threatened with imprisonment, no such provision being made for those merely fined. Why such a distinction? Leave of appeal on both facts and law should be granted; otherwise, what security is there of fair play? Motorists would not be sorry to see the whole Bill abandoned, so full of absurdities and injustice are its provisions. Let it become but a memory of the early and amateurish efforts of enthusiastic legislators whose road, no doubt, was paved with good intentions, but led to undesirable conclusions all the same.

Dulness the Result.

AMID all the uncertainty now prevailing with regard to the future position of automobilists one thing is very clear to those in the trade. Possible customers are postponing orders, being anxious to know exactly the risks they will run in becoming motorists. People do not want to put their necks in a noose when there is a probability of it being tightened. And whilst they may tempt the law as it now stands, they will be less likely to risk the fines, imprisonment and other threatened penalties to be imposed by prejudiced justices. Hence the diffidence which would-be motorists now display towards the industry.

A South African Club.

At the first run of the Eastern Province Automobile Association eight motor-cars were present, thus demonstrating the hold that automobilism has already obtained in Port Elizabeth. A trip was made to Green Bushes, the cars participating in the event being four De Dietrichs, one Wolseley, one Stirling, and two of the Benz type. Motor-cycles were also included in the trip, a Rex motor-bicycle with a trailer being especially prominent.

The Depreciation of Property.

WHILE it is an undoubted fact that the motor-car has led to an appreciable rise in the demand for riverside cottages along the Thames, it is also threatening to depreciate the value of property in some districts. At the last meeting of the Windsor Town Council, the question of the dust raised by motor-cars when passing through the royal borough was raised, and quite an animated discussion arose. It appears that the succession of motor-cars in the district leads to a perpetual plague of dust on dry days. The dust caused by one car has not time to settle down before the advent of another vehicle, thus causing a continual cloud.

The Dust Nuisance.

UNLESS something was done one Councillor said that people would remove, with the consequent depreciation of property resulting from a general exodus. The complaint is not confined to Berkshire; it is fairly general wherever motor-cars are popular, and is likely to increase unless those responsible for the management and maintenance of the roads are willing to co-operate with motorists in the matter. There is no doubt a great deal of dust associated with motoring, but all the blame should not be given to the car. The science of road making has not yet attained finality, and we look to road surveyors to devise a road surface that will not be so easily disturbed by any sudden rush of air.

A Trans-Continental Trip.

THE last American mail brings the news of what is said to be the first trans-continental trip, Dr. Nelson Jackson, of Burlington, Vermont, arriving in New York from San Francisco on the 26th ult. Dr. Jackson, accompanied by a mechanic, left San Francisco on May 23, and covered the entire distance of 5,900 miles in forty-three days. Neither of the two motorists suffered the slightest ill effects, although they experienced many hardships. The car was a 20-h.p. Winton, on which was carried a complete camping outfit, cooking utensils, water tanks, rifles, fishing-rods, canned foods, etc. The route followed was through California, Oregon, Idaho, Wyoming, Nebraska, Illinois, Indiana, part of Pennsylvania, and thence to New York, via Buffalo. The vehicle arrived in New York in good condition although thickly covered with mud and showing other signs of hard usage. The first good travelling after leaving California was reached when the tourists struck the old military road in the western part of Nebraska. From

Omaha to Chicago the route was along the Chicago and North-western Railway. The exact mileage on the trip could not be kept, the cyclometer being lost on the desert. Fast time was not attempted, as the tourists desired to see the country as they went along.

No Camp; a Gymkhana Instead.

At a special committee meeting of the Yorkshire Club, held late last week, it was decided to postpone the East Coast camp owing to the unsettled state of the weather during the week before Bank Holiday. The Club are, however, organising a motor gymkhana in connection with the Horsforth Agricultural Show, on Monday, the 24th inst. There will be five events, comprising bending race, motor-cycle obstacle and bending race, coach house race, passenger race, and legal limit race. These will be held in Mr. Duncan's Park at Horsforth, in the centre of which is a well rolled and level ground over 150 yards long by 120 yards wide. There will be a special enclosure alongside the course to which all motor-cars or cycles may be taken, so that their passengers may comfortably view the events. The Hon. Sec., Mr. A. W. Dougill, will be pleased to send entry forms to anyone desirous of competing, on application. There are a great number of promised entries, and, as this gymkhana is held in connection with an Agricultural Society Show in an essentially agricultural district the Committee trust that local motorists will support them.

Electrical Vehicles.

In the course of his paper on "Application of Electricity to driving Carriages in Towns," at the recent Engineering Conference, Lieut.-Col. R. E. Crompton remarked that, as regards storage batteries, those used so far are invariably of the lead-couple type, either with electrodes made active by Plante formation or of the E.P.S. type. The Edison battery, about which so much has been written, in which iron and oxide of nickel have been used, has not yet been put into a workable form, although much is expected from it. Apparently, however, it is not necessary to wait for the invention of a new type of accumulator, as there are several forms already in use which work very well, and which can be maintained at a moderate cost. In the author's opinion all that is necessary to reduce the cost of accumulators further is standardisation—that is to say, the supply of accumulators should be undertaken very much as the supply of fodder and forage for horses. Once standardisation of this class is carried out to such a point that standard boxes can be exchanged for others ready charged on the production of a subscription ticket, at a sufficient number of charging stations, the difficulties and risks of this method of mechanical propulsion become greatly lessened; in fact, they practically disappear. The cost of tyre-upkeep in electrical cars has been found to be unexpectedly high, although a good many of them use solid rubber. This high cost is probably due to the vehicles being rather heavy, and probably also because the mileage run by them is very considerable. Also probably on account of supposed facility in arranging the gearing, the wheels of these cars have in many cases been unnecessarily small, and it is known that the deterioration of solid rubber tyres increases in proportion to the number of revolutions made by the wheels.

The Discussion.

THE discussion on the paper was opened by Sir E. Carbutt, who, referring to his own experience with a touring car weighing some 2½ tons, commented on the expensive character of the tyres, which might be due to some extent to the heavy car. He emphasised the necessity for methods of standardisation, more especially in battery equipments, and instanced the practice of the Electromobile Co., who gave facilities to subscribers for obtaining re-charged batteries for any of their vehicles, and also insured them if required. He mentioned the

difficulty in getting the battery re-charged when touring. Mr. Theodore Chambers said that in the matter of expense a town carriage would cost £1 a day, but it had the advantage over horses of great mileage. One of his company's carriages had covered 850 miles in May, or at the rate of 10,000 miles per annum. The cost of pneumatic tyres came to £100 per annum, garage charges, say, £200, and driver £100, making a total of £400 for running and repairs per annum, which he saw no possibility in reducing. Mr. H. F. Joel could not agree with the practice of driving on to the front wheel, but considered there was less chance of slipping when driving on to the hind wheels, and for hill-climbing this was by far the best place. He quite agreed as to the efficiency of chain driving. Referring to the Edison battery, he did not think it would be a lasting one. Mr. P. W. Northey preferred one motor driving on to a live axle as the most efficient method of transmission. He thought all rubber tyres were a mistake, but solid rubber ones less troublesome than others.

A Locomobile at Tientsin, China.

Motor Boat Race.

A NOVELTY on the programme of the Royal Southampton Yacht Club's regatta on Saturday was a race for motor-boats not exceeding twenty-five feet in length, the first that has taken place on the Solent under the rules and regulations of the Motor Marine Association. Four boats were entered, of which two—Captain Spooner's Cornubia, fitted with a Tangye engine, and Bertha, Mr. J. Meader's Cowes-built twenty-five footer, fitted with a Lozier engine—were considered as being very closely matched. The Cowes boat with the American engine did not put in an appearance, and Captain Spooner had the easiest of victories. His only serious competitor was Captain Stringer's Nugwug, which is fitted with a Truscott motor, but which was not nearly powerful enough to drive the boat through the rather choppy sea which prevailed. As it was, after deducting time allowance according to the Marine Motor Association's scale, Captain Spooner won with half an hour to spare over a nine miles course.

The Motor Volunteers.

ON the 28th ult. Mr. J. T. Overton (in connection with the Motor Volunteer Corps) was on duty, driving to Royston and back. The work of the corps is proceeding apace in the Chester command, where Captain Hammond has been making a personal tour through his district for the purpose of enrolling those who have made application for membership. Lieut.-Colonel Mayhew arranged with several of his officers for a staff ride on the first three days of the week now closing over the manœuvre area, in order that the chief roads and localities may be familiar to those doing duty during the forthcoming manœuvres, and to arrange for the supply of petrol, stores, etc., at various points.

Bottles for Motorists.

Our fears with regard to the prejudice of administrators of the law against motorists find confirmation not only in the remarks of such J.P.'s as the chairmen of Surrey and Sussex Benches, but also in the speeches of rural councillors throughout the country. At the last meeting of the Eton Rural District Council, Councillor Hill contended that the only way to stop speedy motor-cars was to put broken bottles on the road—a procedure that reminds us of the Berkshire constable who, in the early days of motoring, wanted to arrest the progress of motor-cars by placing the trunks of trees across the roadway. The Eton Council, which has a jurisdiction over a score of parishes, has decided to protest against the extension or abolition of the speed limit—a decision arrived at after hearing speeches full of passion, as displayed in the utterances of Councillor Hill. When prejudice would resort to broken bottles, can our suspicion of the law be regarded as an incorrect view of the position?

Heavy Motor Wagons in Lancashire.

WHEN in Manchester the other day we were struck with the large number of heavy motor-wagons in use in connection with the cotton trade, the vehicles being employed in conveying loads of cotton goods direct from the factories in East Lancashire to the shippers. Some interesting information with regard to this growing traffic is given in the report of the Main Roads and Bridges Committee of the Lancashire County Council, which has just been issued. The report states:—"From February 12th to June 11th this year 798 single journeys have been made by motor-wagons over the main roads from Blackburn and Darwen to Bolton. In round figures this means 20,000 tons of traffic per annum. On the Blackburn and Walton Cop Main Road, from July 7th to July 13th last, there were 79 single journeys made by motor-wagons, with trailers attached, and 26 by motor-wagons without trailers, making a total for the week of 105. If this average is maintained throughout the year some 60,000 tons weight will pass over the road, much the larger proportion of which is absolutely new traffic. On the Preston and Blackburn turnpike road there were 109 single motor-wagon journeys made during the week ended June 16th last. This would give an average of 45,344 tons per annum, the whole of which is entirely new traffic. The Committee have already been compelled to ask for sanction to a loan of £8,800 to put two of these roads in a proper condition to cope with this traffic."

Motor-Buses at Birmingham.

THE Birmingham Watch Committee have decided to grant permission to the Birmingham Motor Express Company to run motor-omnibuses between New Street and Hagley Road. The fare will be twopence, with penny stages, and, like other public vehicles, the cars will be subject to bye-laws and to inspection and examination both as to seating accommodation and as to mechanical efficiency. Originally, we believe, there were two applications for a license over the same road, but the parties came together, with the result that the judicial sub-committee, to whom the matter was referred, could hardly do otherwise than recommend the application. Eastbourne, Hastings, and other places now have their motor-buses, and it only requires a few leading provincial cities to adopt the same means of public locomotion to secure universal recognition of the motor-omnibus as an ordinary vehicle of the street.

An Official View of the Bill.

SINCE our comments on the Motor-Car Bill were written, the Automobile Club is understood to have come to the same conclusion that, if the Bill is passed in the form proposed in the House of Commons on Tuesday night, it will seriously prevent the development of automobilism in this country. The motor industry, which of late has been improving, will be crushed, many of the present owners of cars will dispose

of them, and prospective owners will abandon the idea of joining the ranks of automobilists. As is pointed out in a statement officially circulated, the Bill provides for the registration and identification of motor-vehicles, the licensing of all drivers, a speed limit of ten miles per hour (or less) in congested towns and thoroughfares, and for heavy penalties (including imprisonment without the option of a fine) for breaches of its provisions. It is now proposed to introduce a speed limit for the open country road, and to insist upon the examination of drivers. Further, the administration of the law is placed in the hands of the Justices of the Peace, many of whom are exceedingly prejudiced against the extension of automobilism, and two Justices of this type in Petty Sessions can, on the evidence of a single policeman, impose a penalty of £20 and suspend a licence for five months, and against this sentence the unfortunate defendant will not even have the right of appeal.

Inquiry Suggested.

IF it is the object of Parliament to prevent the extension of automobilism and to stamp out the motorist as they would a criminal class, no means more effectively calculated to secure this end could have been devised. Few self-respecting men, few persons of moderate means, will dare to run the risk of the fines and imprisonment now seriously proposed. If the Bill is passed in the present moment of prejudice and panic, the mistakes of seventy years ago, when the steam road carriage movement was killed by reactionary legislation, will be repeated, and the English people will be largely deprived of the advantages of mechanical traction. Under these circumstances it is suggested that the present Bill should be dropped, and the example of the French Government followed. That Government has appointed a representative Commission of enquiry which is carefully examining the whole problem. A Royal Commission taking evidence during the autumn months would be able to propose legislation far more likely to afford a permanent solution of the problem than the repressive measure now before Parliament.

A Lively Agitation.

DURING the week telegrams have simply poured into the House of Commons against the Bill, and motorists from all parts of the country have written and wired to the M.P.'s interested, urging opposition and counselling the rejection of the measure. The Bill will be again under discussion by the time these lines are in print; no time is to be lost; we repeat our advice to motorists to do all they can to influence members against the Bill, and so secure the rejection of a measure likely to adversely affect a new industry and to reduce automobilism to a puny movement indeed.

MR. A. BILLING, of 89, Edgware Road, W., writes that he has no connection with the gentleman of similar name who was recently fined for furiously driving a motor-car at Kingston.

THE Alexandra Simplex Motor Company, Limited, has been registered to manufacture and sell motor-cars, and to adopt an agreement with Messrs. C. Heyermans and A. Bluhm. The first directors are Messrs. T. H. Weguelin, R. H. Fuller, and H. Heyermans.

THE Post Office authorities have started a series of experiments with motor parcel vans, several vehicles leaving the Mount Pleasant office nightly for Epping, Redhill, and other outlying districts. An experiment has also been made with a motor-van for parcel work within the City boundary.

AN automobile demonstration was recently held at Selangor, in the Federated Malay States. Fifteen vehicles were at the rendezvous, including the Selangor Government's motor fire engine. Among the touring cars were three 8-h.p. Albions, an 8-h.p. De Dion, and a 9-h.p. Darracq. It is reported that no fewer than twenty cars are on order for residents at Selangor and neighbourhood. A public service of motor-vehicles is also about to be started on the east coast of Malasia, Pahang.

LONDON'S TRAFFIC.

THE members of the Commission on London Traffic were well-advised in taking a motor-car trip along some of the main arteries of metropolitan traffic one day last week; but let us hope the superficial knowledge thus obtained will not lead to their posing as experts and authorities. For the subject is too vast to be comprehended by a kind of Cook's tour—even though the guide and interpreter to the difficulties of street locomotion in London is Mr. W. Rees Jeffreys, the hon. secretary of the Roads Improvement Association, and the administrative secretary of the A.C.G.B.I.

Six motor-cars were placed at the disposal of the Automobile Club on the 31st ult. for the purpose of the inspection, and the members of the Commission who decided to thus obtain a kind of nodding acquaintance with their subject were Sir David Barbour (Chairman), Lord Ribblesdale, Sir Francis Hopwood, and Mr. Schuster. The first trip was to Hammersmith, Brentford, Hanwell, Ealing, Acton, and Paddington. It was suggested

construct a thoroughfare round London. The Commissioners were next taken across Brent Bridge and on to Hanwell. It was urged that since the laying down of the tramway at Hanwell the roadway had greatly deteriorated. The combination of stone setts and macadam was a most dangerous one, and ought not to be permitted. From Hanwell the route lay through Ealing, where complaint was made of central standards, to Acton. The looping of the tramway lines at the latter place was commented upon, and the road at this point was characterised as dangerous. The bad condition of nearly the whole length of Harrow Road was pointed out to the Commissioners, and it was submitted that a street improvement was needed at the junction of Harrow-road with Edgware Road. The tour was continued through Maida Vale, Kilburn, Cricklewood, Child's Hill, Finchley Road, St. John's Wood Road, Baker Street, and Park Lane to the Club, where luncheon was taken.

Later in the day a similar inspection of the roads of north-east London was made, Sir J. Wolfe Barry taking the place of Lord Ribblesdale, and it was soon apparent that the road com-

The Duke of Devonshire's 20-h.p. Welsley Car. As will be seen, the rear wheels are fitted with Parson's non-skid arrangement.

by the Club that in order to relieve the pressure of traffic in Piccadilly, Pall Mall ought to be continued through the Green Park so as to converge upon Piccadilly at the widened portion near Hyde Park Corner. The policy of providing alternative routes as opposed to widening existing roads deserved further consideration. The attention of the Commissioners was directed to the widenings at Knightsbridge and Hammersmith Road, and to the difficulties of traffic at Hammersmith Broadway. It was pointed out to the Commissioners that it was proposed to link up the tramway line terminating at Hammersmith Broadway with the line on the south side of Hammersmith Bridge, but the Club thought that as that bridge was already insufficient for the traffic upon it a special bridge ought to be constructed on the eastern side of the existing bridge if the tramway scheme was agreed to.

The opportunity was taken at Brentford of suggesting to the Commissioners that the old trunk roads were insufficient to bear the local traffic, apart from the through traffic, and the opinion was put forward that one of the best means of relieving congestion in the central parts of the Metropolis would be to

munication into Essex is worse than to any other of the home counties. The Commissioners were taken along Shaftesbury Avenue to the junction of Tottenham Court Road, Euston Road, and Hampstead Road, as one of the most dangerous in London. The proposal to spend a quarter of a million on widening it will not meet the circumstances, and the Club suggests that a tramway should be built, carried to an underground tube, and so under Tottenham Court Road and Shaftesbury Avenue to the Embankment. From Euston Road the cars ran to the Angel, through Essex Road, Kingsland, Clapton, Lea Bridge Road, Leyton, Stratford, Bow, Whitechapel, and back again to the offices of the Traffic Commission. Through Leyton, Stratford, and Bow the Commissioners realised the bad road surface, which is really a disgrace to London. If the great Mile End Road, one of the widest thoroughfares in the Metropolis, could be adequately attended to, and the rude surface dealt with by modern methods, motorists would not be long in making their way to Epping Forest and other resorts in Essex now rendered impossible owing to the difficulties of getting there

CONTINENTAL NOTES.

By "AUTOMAN."

THE "cock and bull" motor-car accident story quoted by the Earl of Camperdown in the House of Lords the other day, as a reason for adding further penalties to the "bill for the persecution of motorists," has had a suitable pendant at the meeting of "the provincial council of Western Flanders," whatever that august body may be. The meeting took place on the 17th ult., and naturally the question of finding further means of annoying automobilists was on the tapis. One of the provincial Dogberrys, Mr. X., said "The organised running over of pedestrians cannot be tolerated, chauffeurs are getting speed mania. Their temerity goes even as far as death (translated *la mort*). Why one of them has even named his automobile *Mors*." Mr. Y. replied, "That is the name of the maker." Mr. X. retorted, "He is appropriately named, he makes deadly machines."

motor-cars in Paris. M. Rives tells me that he is busy organising the 6^e Exposition de l'Automobile, du Cycle et des Sports, which will open its doors on December 10th and finish on December 25th. Already the applications for space are very numerous. The largest stands last year were 100 square metres in superficial area; this year the space will be reduced to eighty square metres. M. Rives also tells me that there will be this year a much larger number of foreign exhibits than last year.

THE Exhibition will of course be held, as before, in the Grand Palais on the Champs Elysees, and comprise fifteen classes. Applications for space must be addressed to the "Commissariat General de l'Exposition," 6, Place de la Concorde, before the 20th September next, accompanied by a declaration as to the class in which the applicant desires to exhibit, the exact designation of the objects proposed to exhibit, and the space required.

The Chinese Ambassador to Austria and his suite on a Lohner-Porsche Electrical Car.

[Allgemeine Automobil Zeitung.]

QUOTATIONS from the Motor-Car Bill are appearing in the French press, and our trans-Channel neighbours are sorely puzzled to understand "ces Anglais," who have always had the reputation on the Continent for having such sound practical common sense, especially where a question affects commerce. We are put down as a nation of shopkeepers, of course, who know better than anyone else how to nurse and cultivate trade and free it from the ridiculous barriers from which it suffers under French bureaucracy. The Motor-Car Bill, however, is doing much to ruin our reputation on this side of the Channel. Such a killing of the goose that is about to lay golden eggs is completely beyond the blindness and folly of even French ultra "red-tapeism."

I HAD the good fortune to pass the afternoon of Thursday last with M. Gustave Rives, the well-known Paris architect, who was the chief organiser of the last exhibition of

THE allocation of the various stands will be decided by casting lots, in the case of all those whose applications have been made before the 20th September. The largest spaces will be balloted for first. Applications for space made after the 20th September will be allotted in order of receipt, and according to the space which remains unlet.

THE Laffrey meeting begins to-day by the weighing in the market at Grenoble. To-morrow, Sunday, the hill-climbing contest takes place in the morning, and in the afternoon there will be an exhibition of the competing cars in Grenoble. On Monday there will be an excursion to Uriage-les-Bains, a gymkhana, a banquet, and a theatrical performance, and the meeting will be brought to a close on Tuesday by an excursion to the "Lautaret," 2,075 metres above sea level. There are upwards of 30 competitors.

THE Austrian Automobile Club is organising a hill-climbing competition from Schottwein up the Semmering for Sept. 13.

L'AUTOMOBILE CLUB DE LA COTE NORMANDE has just been formed at Trouville.

THE newly-formed Automobile Club de Spa proposes to hold a hill-climbing competition at Malchamps next month.

A RUMOUR is current to the effect that Messrs. Eugen and Richard Benz are severing their connection with the Benz Co., of Mannheim, and are about to start new motor-car works at Ladenburg, near Mannheim.

THE German Automobile Club is already busily engaged on finding a suitable course for the 1904 Gordon Bennett race. Several routes have been suggested and runs are shortly to be made over them with the view of ascertaining their suitability for the Cup race.

THE Automobile Club of Marseilles will hold a competition of tourist and public-service vehicles at the end of October. The cars for the conveyance of tourists must be capable of carrying eight passengers and 80 kilog. of luggage exclusive of the driver and conductor. The public-service vehicles are to accommodate at least 12 passengers and 360 kilog. of luggage, as also the driver, a mechanic and a conductor. Marks will be awarded for (1) consumption of fuel and lubricant; (2) regular and easy working of the mechanism; (3) behaviour of tyres; (4) ease of evolution and control of the vehicles; (5) accessibility of working parts and facilities for carrying out repairs quickly; (6) elegance and comfort; (7), average speed over varying routes. The trials will consist of five different runs of about 150 kilometres each. Entries will be received up to the 15th October at the rate of £4 per vehicle.

A PROJECT is under consideration to construct a motor racing track round the Forest of Fontainebleau. It would be about 55 kilometres long and from 12 to 15 metres wide.

THE Mayor of Antwerp has followed the example of his Brussels confrere, and has issued a regulation limiting the speed of motor-cars in certain parts of the city to five kilometres (3½ miles) per hour. The Automobile Club of Antwerp has held a special meeting, when it was decided to send a protest to the Mayor, urging that motorists should be allowed the same speed as drivers of horse-drawn vehicles.

THE Lanchester car has been much in evidence at Cowes during the yachting week.

MR. O. C. SELBACH has opened a retail branch for the sale of motor accessories at 67 and 68, South Audley Street, London, W.

AN attempt is being made to arrange a match race between Mr. L. P. Mooers and Mr. Percy Owen, each to use the car which competed in the Gordon Bennett race.

"PUNCH" has a report of an imaginary meeting of the motor-car trade, at which Mr. Slaughter, representative of the firms of Mors et Vita, Panique, and the "Massacreur" Gesellschaft, presided.

MR. JOHN B. HULTON and Mr. G. H. Smith, of Warrington, have had an exciting experience at Sutton Weaver, nine miles from the town. They were returning from a motor-car run and did not notice that the bridge spanning the Weaver Navigation Canal was open to allow a steamer to pass. At a speed of about ten miles an hour the car dashed into the gateway and thence fell into the water, a distance of 15ft., with both occupants. They managed to cling to a rope until rescued. The car was much damaged.

THE "JACKSON-COVERT" VOITURETTE.

IN the report of the Exhibition at the Agricultural Hall (see issue March 28th, 1903) we gave a general view and a brief description of the motor-car recently put on the market by Messrs. R. Reynold Jackson and Co. We are now able to give some further details of the little vehicle, which is fitted with a 3-h.p. vertical motor located in the rear of a tubular frame. The

Fig. 1.—Plan of "Jackson Covert Car."

cylinder is air-cooled, but a water-cooled head is provided, the circulation being on the thermo-siphon system. Two speeds are provided; as will be seen from the plan (Fig. 1), the engine transmits its power by a chain to a short countershaft about the centre of the frame. On this are mounted two combined sprocket wheels and clutches, the power being conveyed to

Fig. 2.—Section of Change-Speed Gear Shaft.

the rear live axle by one or other of the two chains provided. A sectional view of the change-gear shaft is given in Fig. 2. Steering is controlled by a side tiller, on the pillar of which the change-speed and advance ignition levers are mounted. The vehicle complete weighs only about 4 cwt. The speed of the car ranges from 5 to 20 miles per hour.

THE value of the automobile for everyday use has received clerical recognition in Michigan, where the Rev. E. J. Blekkink, pastor of the Second Reformed Church in Kalamazoo, has purchased one to use in making his pastoral calls. Mr. Blekkink has the distinction of being the first clergyman in Michigan to own a motor-vehicle.

THE DICKINSON "MORETTE."

A NEW motor-vehicle known as the "Morette," and adapted to seat two persons, has just been put on the market by Mr. B. E. Dickinson, of the Toledo Engineering Works, Birmingham. As will be seen from the accompanying illustration, the body and seat are entirely built of steel tube firmly braced together, the floor of the vehicle and seat being of wood-fibre carried on cross tubes. The vehicle is made in two forms, one being propelled by a $2\frac{1}{2}$ -h.p. motor and the other by a 4-h.p. engine hinged on a strong bracket behind the crown of the front wheel fork, of which it forms a part. This bracket also carries a rubber-covered pulley, with which the driving pulley of the motor engages frictionally, and which carries on one of its sides a sprocket connected by chain with a sprocket fixed on the hub of the front wheel. To reduce vibration in the frame due to the motor, wood-fibre or other suitable material is interposed at the hinged joint of the bracket. The steering is by tiller, a part of which projects in front of the head and is connected by a rod to the cylinder head of the engine, so that by an upward movement of the tiller the driving pulley of the motor may be disengaged from the intermediate pulley, thus giving a free engine. The current is switched on and off by the handle-grip, and the tank (which contains sufficient petrol for a 70-mile run) carburettor,

accumulator and coil are all placed in the front part of the carriage close to the motor. The latter is started from the seat by the pulling of a flexible cord fitted in a groove of the fly wheel.

The vehicle starts and runs very smoothly and with very little vibration, as much of this is absorbed by the rubber covered driver and intermediary pulleys. The steering is easy, as the weight of the motor being behind the front fork has a steadying effect. The "Morette" is designed to run from 12 to 15 miles per hour, and is specially adapted for the use of ladies, doctors, clergymen, and others who require a light handy vehicle capable of travelling at a moderate pace. Band brakes are fitted to drums connected with the hubs of the rear wheels. The overall width of the vehicle is 3 ft. 2 ins., and the wheel base is 5 ft. 6 in., the weight complete being about 140 lbs.

THE Minneapolis Automobile Club, of Minneapolis, U.S.A., has issued a circular to the public in which its co-operation is requested in checking reckless driving. The club appreciates the fact that chauffeurs are not complying with the law, and in the circular attention is called to the fact that the automobilists have secured all they have asked for in the way of legislation. No accidents have as yet occurred, and the club is anxious to avert any. The closing paragraph of the circular is as follows:—"The public is requested to report the number of any machine which is being carelessly operated to the secretary of the Automobile Club, and the owner will be dealt with according to the rules of the club, which are designed to prevent unsafe operation of machines."

SOME USEFUL NOTES.

MOTORISTS may sometimes wish to find out the approximate grade or grades of some particular stretch of road, and have no ready means at hand for the purpose. If this happen only once or twice in a season, good guesswork may do, but if one has a disposition to follow up this sort of investigation, a simple home-made device may answer the purpose fairly well. Take a board about five inches wide and of appropriate length, and attach a

good carpenter's level to it by means of a hinge at the rear end, as shown in the accompanying sketch. At a distance of $12\frac{1}{2}$ inches from the centre of the hinge set a foot rule upright and at exactly right angles to the plane of the board.

To use the instrument, take it from its place in the body of the vehicle (where it can be carried most conveniently), and arrange it upon the bonnet covering the motor, using a stick or stone under the forward end, if necessary, to let it rest evenly. From the top of a hill or slope sight along the board to some object at the bottom; raise the front of the level until the bubble is in the centre and note the measurement upon the rule. This gives one per cent. grade for every one-eighth inch noted on the rule, or a fall of one foot in every hundred for each one-eighth inch. Then measure the distance to the object sighted at the bottom of the hill, and the height of the hill can easily be calculated. Let us say, remarks Automobile Topics, that the measurement noted on the rule is two inches. This indicates, then, a fall of sixteen feet in every hundred. Suppose the distance to the bottom of the hill is 225 feet; then the height of the hill is two and one-fourth times sixteen, or thirty-six feet. At first thought it might seem that the foot rule on the instrument should be a circular scale, conforming to the axis of the hinge; but this is not the case. The upright measure corrects the departure from the perpendicular in the ground slope and gives the true height. The device is, of course, removable and can only be used when the car is at rest.

FROM the booklet issued by the Continental Caoutchouc and Gutta Percha Company, "Motor Tyres; how to treat and repair them," we notice that a recommendation is given to every driver to carry at least one back and one front spare tube with him. Great care should be taken with these spare inner tubes, as they

are easily damaged, either by nipping or nails, etc. Many drivers have the unfortunate habit of keeping their spare tubes in the tool-box, which is the very worst place in which they can put them, as the moving of the tools, etc., when the car is in motion may easily damage the tubes. To avoid this the Continental Company have placed on the market a special waterproof canvas-covered bag, illustrated herewith, made to hold two tubes, which are placed therein deflated and rolled up. The bags look very neat, they take up very little space, and their use will save much trouble and annoyance.

THE EARLY DAYS OF MOTORING.

IT was Fair Day at Melksham. The streets of the little English town buzzed with country people bargaining for cheap finery at the peddlers' booths or staring at the Punch and Judy shows at the corners. Suddenly a hum of astonishment, swelling into rage, rose on the outskirts of the crowd, and as it grew in volume and fierceness, Punch found himself perpetrating his direful deeds without an audience. With open mouths the crowd stared at an apparition advancing slowly down the main street. First came a carriage and pair, the horses panting in a white lather of foam, a postboy sitting limply on the back of one of them, a grimy mechanic on the box with the driver, and a couple of spruce gentlemen inside. Next, an astonishing puffing monstrosity—a thing on four wheels, with fire glowing beneath, a mist of steam rising behind and a couple of engines wheezing between the wheels. Two men were riding on the box, but instead of reins, one of them was gripping a horizontal wheel with which he seemed to be guiding the devilish contrivance.

Not only were there no horses to pull the infernal machine, but it was itself drawing an open barouche in which some men

No further invitation was necessary. The air was speckled with flying "remnants of a paleozoic age." An engineer had his scalp laid open with flints and stones. The stoker had the same experience, and in addition was knocked off his seat into the road. Thereupon the rest of the sixteen mechanics and passengers formed in line of battle, and, after desperate deeds of daring, succeeded in securing the caravan in the yard of a friendly brewer, where it was guarded by constables during the night. The steam carriage was taken to Bath the next day under the escort of the officers, and on the return trip it was smuggled through Melksham at midnight, drawn by horses.

Such were some of the diversities of life among the pioneers of automobilism. Most of us do not appreciate how much energy, ingenuity and courage were devoted to the development of mechanical carriages more than seventy years ago. When Gurney made the trip that so stirred the wrath of the conservatives of Melksham, England seemed at the beginning of an automobile age. The system appeared more promising then than it did as recently as ten years ago. Gurney's carriage was a wonder for its time. It was intended to be used exclusively as a motor, drawing behind it another carriage for passengers. As first designed it was steered with a lever, but in its improved

Gurney's Steam Carriage on the way to Bath in 1829.

sat with an insolent nonchalance most exasperating to a free-born Briton. Behind this outrageous contraption came another carriage with four lathery horses and two postboys. Eight gentlemen of leisure and as many engineers and mechanics were distributed among the various vehicles. So, to the amazed and indignant inhabitants of Melksham, appeared on July 30th, 1829, the steam automobile of Sir Goldsworthy Gurney on the first long journey ever performed by a locomotive at a sustained speed, either by road or rail. Sir G. Gurney had been scorching between London and Bath at the appalling rate of ten miles an hour or more, but on approaching Melksham he had slowed down to a walking pace to avoid exasperating the crowds at the fair. But the popular wrath at his unsightly innovation was not to be so easily disarmed. The hum of anger swelled to a roar. "I, Bill!" shouted one conservative citizen, "Wot is it?" "Give it hup," Bill responded, "but 'eave 'arf a brick at it anyway for luck."

form it had a horizontal wheel, such as is used on the modern motor-car. It had a pair of high-pressure engines whose use was made practicable by several ingenious inventions of Gurney's, which have proved of fundamental importance in all subsequent engineering practice. There was a tubular boiler instead of the old kettle, and the famous Gurney steam jet, whose subsequent adoption by Stephenson doubled the speed of the Rocket and made that pioneer rail locomotive a practical success. The Gurney carriage was driven by cranks attached to the axle of the hind wheels, and it was so arranged that power could be given to one hind wheel or both. It was about 10 ft. long, most of its space being required for machinery, coke, and water. It had the disadvantage of having to stop often for supplies. Every half-hour its thirsty boiler called for more water, and every hour its hungry firebox insistently demanded coke.

On the trip in question an extra supply of coke was taken along in one of the horse-drawn carriages, but even at that time

the idea of making a steam vehicle depend upon one drawn by horses to keep it going was considered open to criticism. The difficulty was obviated later by having fuel stations at regular intervals along the road. On the journey between London and Bath, the inventor would stop whenever he saw water and fill up his tanks, not knowing when he would have another chance. It made the machine puff with justifiable pride to rest in dignified ease while eight mechanics and eight gentlemen in tall hats and long frock coats ranged themselves in line and passed buckets from a pond on the other side of a hedge. This journey was undertaken under the auspices of the Quartermaster-General of the Army, who wished to test the value of the steam carriage for military purposes, and the Army authorities considered the experiment supremely successful. All the arguments against the new device were disproved at the outset. A complication with a mail coach and a pile of bricks broke part of the machinery, and almost the entire journey was made with the power of only one wheel. At the first stage of the trip, the motor vehicle met and passed twenty-one carts, seven wagons, two post chaises, four mail coaches, seven stage coaches, one two-horse dray, three gigs and six horses, and the report triumphantly asserts that not a single horse started or was disturbed except in the preliminary mix-up. An average speed of ten miles an hour was maintained with ease, and in spurts the machine went at the rate of between twenty and thirty miles an hour.

Coke was sometimes not obtainable, and it was necessary to use coal. In such circumstances, as even Lieutenant-Colonel Sir C. W. Dance, the enthusiastic inspector and subsequent patron of Gurney, admitted, the steam carriage might be a nuisance. It poured out clouds of smoke, and in the dark "some sparks flew up the chimney which made the appearance of a beautiful firework. This would be highly objectionable and dangerous to thatches or haystacks, but it can never happen with coke." It is noteworthy that Gurney, whose fertility of mind made him an Edison of his time, regarded the clumsy fuel he was compelled to use, and even the whole system of steam propulsion, as a passing makeshift. He distinctly foresaw the improved motors of to-day. In his testimony before a Parliamentary Committee in 1831, he was asked:—"Do you apprehend much decrease in the price of your engines?" He responded: "I do, and I also anticipate that steam will be supplemented by the use of other elementary power; but I do not think that will take place in our day. I think that steam will be generally introduced, and that the public will feel the importance of it; and that scientific men will be directed to examine and employ in its stead other substances, and new compounds are continually turning up, and some will eventually be applied to mechanical purposes. . . . I do not specify any particular compound at this moment; I state those generally which are known to produce power by chemical change; some peculiarly explosive and aeriform bodies, for instance."

On this memorable trip in July, 1829, the Gurney steam carriage covered the two hundred miles from London to Bath and return with complete success. It ran up the steepest hills with ease, drawing another carriage behind it, at from seven to ten miles an hour, and it covered eighty-two miles in eleven hours, including all stops. Gurney's success was so impressive that within two years from twenty to forty different motor carriages were under construction by different persons, some of them built, as the inventor testified before the Parliamentary Committee, by men "who previously had laughed at the idea and considered it chimerical."

Gurney seems to have anticipated every possible objection. He was asked, for one thing, what would happen if the guide or director fell asleep, or dropped off his seat, or met with some other accident. "I have provided for all these casualties," he replied, "by making the valves of the engine only remain in gear while the guide is in his proper situation. The moment he is thrown off his seat by accident or otherwise, the engine instantly stops." He explained that the engineer's foot held the

valves down, so that simple neglect to attend to his business would stop the machine. The same contrivance enabled the driver by merely lifting his foot to prevent the carriage from running too fast down hill.

In 1831, Sir Charles Dance ran the Gurney carriage between Gloucester and Cheltenham uninterruptedly for three months, as a business arrangement, without a single accident. It covered the distance of nine miles regularly in fifty-five minutes and often in forty-five. Other inventors were working along similar lines, and some of their carriages were also accomplishing profitable commercial work. The sun of the "Automobile Age" seemed rising in a clear sky, when it was suddenly eclipsed by the uprising on all hands of a stubborn prejudice. Turnpike companies discriminated against motor-carriages on their roads, and when the matter came before Parliament, that body, notwithstanding a warmly favourable report from a select committee of the House of Commons which had fully investigated the subject, passed laws which, by means of excessive tolls and absurd regulations, made it impossible for a self-propelled vehicle to be successfully operated on an English highway.

The British lead in automobile construction was abandoned. to be taken up sixty years later by the inventors of France. Gurney, suppressed by the laws that ought to have encouraged him, gave up the subject of motor vehicles in disgust. Long before, he had invented the oxyhydrogen blowpipe and the Drummond light, had anticipated the idea of the electric telegraph, and had made suggestions concerning heat, electricity and gases which secured an acknowledgment of indebtedness from Faraday. Now he took his steam jet which he was not allowed to use on the highways and employed it to put out fires in coal mines, one of which had been burning for thirty years. He ventilated sewers with it. He invented the Gurney stove. He ventilated and lighted the Houses of Parliament on new principles. He devised a flashlight system for lighthouses. He was knighted in 1863 for his services to science, and died in 1875 full of years and honours, but still debarred by the laws of his country from developing the great invention which he had carried so far a half century before. In 1829, grave fears were expressed that the horse might be driven from the highways, to the ruin of British agriculture. When Sir Goldsworthy Gurney died in 1875, the horse as a beast of burden survived him, but it might not have done so if there had been a fair field and no favour. In 1875, the horseless carriage was practically no further advanced than in 1829. But if the inventors of the earlier age had been allowed to go on, there might have been a race of English Fourniers sixty years ago, and the whole history of the world's transportation system might have been written differently.

THE San Francisco Fire Department has just purchased a fast electrical motor-car for the use of its chief.

THE Park and Estates Committee has decided to recommend the Birmingham Town Council to restrict the speed of motor vehicles when being driven through the park to eight miles an hour.

WE hear that tenders are about to be called for the supply of a number of public service vehicles for Mysore, India. The cars are to be propelled by steam or petroleum engines and be capable of carrying six passengers and 1,000 lbs. of luggage.

IN a recent issue of the *Motor-Car Journal* we find, says the "Surrey Advertiser," a list of 128 prosecutions for furious driving during a single week, and an editorial note states that space could not be found for about 50 more. Of these 128 cases only seven were dismissed, and the fines (exclusive of costs) imposed upon the remaining 121 totalled £364! Surrey contributed 48 of these 128 cases, and the fines amounted to £135. The cases were heard at the following places: Chertsey, 19 cases, total fines £50; Oxted, 18, £36; Kingston, 4, £15; Epsom, 3, £13; Guildford, 3, £13; Richmond, 1, £10. The highest alleged speed was 32 miles an hour.

MOTOR-CYCLING NEWS.

MOTOR-CYCLE racing again formed interesting items at many of the sports meetings held on Bank Holiday. Some fine riding was seen at the Canning Town track at West Ham, where three events were run off. In the three miles motor-cycle match, J. F. Crundall beat H. Martin by a quarter of a lap. Time (with a flying start), 3 min. 25 1-5 sec. In a one mile motor-cycle match H. Martin beat J. F. Crundall by a yard. Time (with a flying start), 1 min. 9 4-5 sec. The five mile motor-cycle race resulted as follows:—T. Tessier, 1; J. F. Crundall, 2. Time, 5 min. 44 2-5 secs. Tessier, who succeeded in lowering the world's record for the flying mile by one-fifth of a second in his heat, carried the final in easy fashion, again breaking the world's record on his "Bat" machine, this time by two-fifths of a second. A three mile motor-bicycle race at Eastbourne was won by H. H. Frowd, while at St. Albans, F. W. Chase beat T. C. Newman in both a mile and a two mile match, his time for the former being 1 min. 37 1-5 sec., and the latter 3 min. 2-5 sec. At Littlehampton, a three-mile handicap was won by G. Atkins (15 secs. start) who on 2-h.p. Minerva covered the distance in 8 min. 29 secs.

A Group of Motor-Cyclists at Nuremberg, Germany.

THE Motor Cycling Committee of the Cyclists' Touring Club are contemplating the organisation of a motor-cycle tour from Land's End to John o' Groat's, to start towards the latter end of September.

THE Auto-Cycle Club's reliability trials will be held from the 10th to the 22nd August, starting daily from the Crystal Palace to such well-known resorts as Brighton, Eastbourne, Folkestone, Canterbury, Worthing, etc. The distance covered during the trials will be not less than 1,000 miles, and failure to climb certain hills will entail a loss of marks, as will also failure to maintain a speed of 12 miles an hour. Forty-eight entries have been received.

AFTER the speed tests of the machines engaged in the 1,000 miles reliability trial the annual motor-cycle race meeting will be held on the Crystal Palace track on Saturday the 22nd inst. As last year, there will be three events. The first is an hour's race for the Autocar Cup, won last year by Mr. J. van Hooydonk. The race will be an invitation one for motor-bicycles only. The cubic contents of the cylinder must not exceed 343,000 mm., and the weight limit is 114 lbs. Silencers must be fitted, but mudguards need not be used. The second event is a five mile handicap for the "Motor-Car Journal" Cup, at present held by Mr. S. C. Holloway. Entries will be unlimited, but the race is confined to motor-bicycles. Weight limit 170 lbs., and cubic contents 440,000 mm. The third event is for the Automotor Journal Cup, also held by Mr. S. C. Holloway. In addition to the cups, gold, silver, and bronze medals will be presented by the Auto-Cycle Club to the first three riders in each event.

THE Edinburgh and Glasgow Motor Cycle Clubs are organising a joint run to Lanark for Saturday, the 15th inst. A large muster from each city is expected.

MAJOR VON PROHAZKA, one of the Austrian delegates to the recent congress of touring clubs at the Hague, Holland, journeyed thither by road from Passau, Austria, on his 2½-h.p. Laurin-Klement (Hewetson) motor bicycle, travelling via Regensburg, Nuremberg, Wurzburg, Frankfurt, Wiesbaden, Mainz and Coblenz. The Major also intended to return by road by a different route, but bad weather prevented him from getting further than Frankfurt-am-Main, where, after riding over 800 miles, he had to have recourse to the train.

As an illustration of what the up-to-date motor-bicycle is capable of, the performance of Mr. A. W. Money on his Rex 3-h.p. is worthy of record. This gentleman recently rode his machine from London to Leicester in six hours and ten minutes, pulling a ten-stone man in a trailer. When it is considered that this time includes a stoppage of 45 minutes for refreshment, etc., and that it was an ordinary tourist run without any pre-meditated attempt at record, the ride was undoubtedly a good one.

ALBERT CHAMPION, the erstwhile professional cycle racer, recently covered a mile on his Clement four-cylinder motor-bicycle on the Charles River track, near Boston, Mass., in 58 4-5 seconds.

As showing the growing popularity of motor cycling in America, it may be mentioned that of 3,101 automobile licenses so far issued by the Secretary of the State of New Jersey, upwards of 400 are for motor-cycles.

AN American concern, the Automatic Lubricator Company, of Caxton Building, Chicago, have recently brought out an automatic lubricator for motor-bicycles, which they have named the "Cycoplex." The sight feed shown in the illustration is attached to the crank case by means of a special T-piece, which has a check valve at its upper end, to prevent oil from splashing up the glass, and a back check valve at the side to admit pressure to the oil tank, which may be directly connected by means of small flexible tubes, as shown. The operation is as follows:—During the stroke of the piston there is pressure in the crank case, which is communicated to the oil tank through the lower tube and retained by the back check. From the tank the

oil is forced through the upper tube into the sight feed, and thence through the needle valve, from the point of which it drops into the crank case, being further assisted by the vacuum which occurs at the return stroke of the piston. When the motor stops, the oil ceases to flow automatically, thus doing away with the necessity of a shut-off to be turned by hand, and perhaps forgotten.

THE FOUILLARON PETROL CAR.

WE are this week able to publish illustrations and particulars of a petrol-car which attracted considerable attention at the last Paris Salon. We refer to the

Fig. 1.—The Fouillaron Expanding and Contracting Pulleys.

vehicle made by M. G. Fouillaron, of Levallois-Perret (Seine), the main feature of which is the system of transmission adopted—that of expanding and contracting pulleys. In the Fouillaron car the idea seems to have been worked out in a practical form, and has already won many advocates. The arrangement of two pulleys—one on the motor shaft and the other on the driven shaft, of which one expands in diameter automatically when the other is contracted, and *vice versa* seems the ideal one for petrol vehicles, because it permits a given amount of power to be converted into speed by merely expanding the pulley on the motor shaft, and, obversely, also permits the power actuating the driven shaft to be greatly increased when the motor-shaft pulley is reduced in diameter and the counter-shaft pulley correspondingly enlarged. The arrangement renders all speed gearing superfluous. The tension of the belt is not affected by the operation of the device, but much difficulty has hitherto been experienced with the belt, owing to the fact that it must run on its outer beveled edges, corresponding in their angle with that of the V-shaped pulley face, and in order to get sufficient adhesion to the pulley these edges must be made rather thick, which means that the belt must be stout. Further, as a belt always works toward the position on the pulley where its tension will be at maximum, the two edges will tend to crawl upon the edges of the pulley, and if one of them happens to get the best of the other in this tendency the chances are excellent for the belt stretching, or leaving the pulleys entirely.

M. Fouillaron has, however, tackled this question thoroughly,

Fig. 2.—The Fouillaron Driving Belt.

and has apparently got over the difficulty by using a specially-designed articulated belt. Fig. 1 shows the pulleys in high-speed position, that on the motor shaft having its largest possible diameter, while the other is contracted, its two component halves being pulled apart to their limit so as to let the belt down between

them. The pulleys are each built up in the shape of two cones formed of interlacing blades. One of the cones of each pair is fixed, while the other can be displaced laterally, giving a variable effective diameter. The driving pulley is fixed directly on the crank shaft of the motor, while the rear one is connected with a pedal-operated clutch. The belt (Fig. 2) is formed of a series of small pieces of leather strung upon three strong cords slightly twisted between each two of the leather pieces so as to prevent them from crowding each other and rendering the belt thick and inflexible. It is triangular in section and angle, and fits the angles of the expanding pulleys. It cannot slip, and is noiseless, while heat and moisture are said to have no effect upon it.

The operation is simple. Under the steering wheel another hand wheel controls by a bevel-gear shaft and a chain the sprocket wheel I on the end of the shaft X. This shaft is screw-threaded at V and engages a nut with a lug, the latter entering a short slot in the lever S T, turning this lever round the fulcrum S according to the direction of the movement of the screw nut. When in this manner the point T descends, the point m rises; that is, the pulley at this end is pushed together, thereby increasing its diameter. At the same time the other pulley is opened partly by the pressure of the belt and partly by the lever Rn. By means of the thumb-screw at T the tension of the belt may be regulated, the helical tension spring at R permitting the pulley B to expand without corresponding contraction of pulley A. The reverse

Fig. 3.—Chassis of Fouillaron Car.

motion is obtained by first disconnecting the clutch; by pressing down a pedal a jaw clutch connects the driven clutch with the left-hand shaft of the differential. This movement causes the sprocket on the shaft to run free; the brake on the differential is then applied, the clutch pedal being still kept down; the power is thus transmitted through the rear expanding pulley, now fast on the left hand of the shaft, to the bevel pinion on the inner end of the latter; thus the other gears in the differential box run in a reverse direction, so causing the car to travel backwards.

The Fouillaron car is made in a number of sizes, ranging from 6-h.p. to 16-h.p. The illustration on page 448 shows the two-cylinder 12-h.p. tonneau. The frame is built of wood and steel, the motor being carried in the fore part under one of the latest types of motor bonnets. By means of the expanding pulley device any desired rate of speed may be obtained. The ignition, water-cooling, steering, brakes, etc., all follow the standard lines. The vehicle is not merely an experiment, for early last year one successfully made a 2,500-mile tour of France, while at Deauville a speed of 56 miles an hour was attained.

At the Grand Hotel, Herne Bay, Mr. E. M. Thierry has established a garage with workshop and inspection pit. He has a qualified engineer to attend to repair work, and will also supply petrol, accessories, etc.

HERE AND THERE.

MR. JOSEPH TRACY, of 513, Seventh Avenue, New York, has sent us particulars of the new device he has brought out for connecting the high tension wire to the sparking plug, illustrated herewith. The advantages claimed are that the connection can be made by simply slipping the connector in place, and that there is no danger of breaking the wires at the joint. When used in association with a De Dion sparking plug a small brass plug is secured to the top of the sparking plug proper by means of a screw, as shown. The brass plug has a cylindrical central portion and a ridge or enlarged portion at each end. The con-

connector proper consists of two strips of sheet brass riveted together and pressed to form a collar or sleeve near the outer ends, to fit round the brass plug referred to. One of the strips is made of spring brass and the other of soft brass, in order that they may be bent together again if they should become separated. It will be noticed that the stranded conductor of the cable is not soldered to the connector. The larger one of the two brass strips is clamped round the rubber insulation of the wire and the bared end of the conductor is passed through a hole in the strip and elased between the strip and the rubber.

AT Kington, Herefordshire, Mr. George Fryer has established a garage and is well equipped for the repair of cars. He has also several agencies and supplies petrol, spare parts, etc.

RUMOURS of a malicious kind having been circulated with reference to the Road Carrying Co., Ltd., we are requested to state that they have no foundation and cannot be substantiated.

ACCORDING to a Continental contemporary the Austrian Daimler Company, Neustadt, Vienna, has received an order from the British War Office for a number of petrol motor-wagons.

FROM Messrs. Siemens Brothers and Company, Limited, comes an interesting pamphlet in which the Schiemann system of electrical vehicles is described, the necessary current for their propulsion being taken from an overhead conductor, the same as electric tramways.

MESSRS. DURHAM, CHURCHILL AND CO., of Sheffield, are now devoting themselves to the production of motor-car parts, comprising live axles, change-speed gears, steering axles, etc., for the trade. A special plant for the cutting of spur and bevel wheels has been put down.

THE F. H. Smith Patents Company, Limited, has been registered with a capital of £6,000 to acquire from Mr. F. H. Smith, of Datchet, the benefit of certain inventions relating to carburettors for petrol motors and otherwise, and to carry on the business of manufacturers of and dealers in carburettors for petrol motors, etc.

MESSRS. JULIUS HARVEY AND CO. have just shipped a special 6-ton steam motor wagon for use abroad. The vehicle was thoroughly tested before despatch with a full load, one trial being on a long hill with gradients of 1 in 7, which was successfully negotiated both up and down. With a trailer this vehicle was found capable of taking a load of 9 to 10 tons.

SINCE the Bailey law came into effect in April last 6,410 persons have certified to the Secretary of the State of New York that they own automobiles, and 1,698 have made applications for operators' certificates, which have been granted. As each applicant for an owner's or operator's certificate is required to pay one dollar, the State derives considerable revenue from the operation of the law.

A BURST tyre has caused a serious accident to a party of Yorkshire motorists touring in Shakespeare's country.

THE German Automobile Club is presenting gold medals to the drivers of the German cars in the Gordon Bennett race.

MESSRS. J. B. CORNEY AND CO., of 20, John Street, Adelphi, W.C., are about to open a garage and repairing shop in the West End.

ON Wednesday next the Cheltenham and Gloucestershire Club will have a run to Bourton-on-the-Water and to Andoversford.

THE Rhenish Automobile Club will hold a hill-climbing competition up the Kutzenbuckel, the highest hill in the Odenwald, at the end of September.

AT Burwash, Sussex, Messrs. S. Hyland and Co. have a workshop always open for the convenience of motorists in trouble. They also stock motor spirit and spare parts.

THE street commissioners of San Francisco, Cal., are making investigations in connection with a proposed regulation which will make it a misdemeanour to operate a petrol motor-car having a leaky fuel tank.

MR. O'CALLAGHAM, of Swords, Co. Dublin, was committed for trial at Dublin on Tuesday on a charge of causing the death of a boy by knocking him off his bicycle with a motor-car in Phoenix-park and driving over him.

ON another page we reproduce an article by Mr. S. B. Moffett in the "Automobile Magazine," in which some interesting particulars are given of the Gurney steam carriage which made its appearance in the early part of the last century.

THE American Automobile Association and the Automobile Club of America have both adopted club buttons of new design. The A. A. A. button is a miniature gold gear wheel, while the A. C. A. design shows a miniature automobile wheel in gold.

MR. H. F. JOEL has completed arrangements for the charging and for the garage of electric cars at 51, Wilson Street, Finsbury, E.C. Current can be supplied at any pressure up to 150 volts, and in any quantity to 100 amperes. Charging can be carried out at any time between 8 a.m. and 6.30 p.m., and repairs to batteries or cars can be undertaken.

NEW arrangements designed to provide an external gap in the high-tension ignition circuit continue to make their appearance, three new ones being illustrated herewith. Fig. 1 shows that introduced by the Ormonde Motor Co., of Well Street, W.; as will be seen, one end is adapted to fit on the plug, while to the other is attached the high-tension wire. The gap is surrounded

Fig. 1.

Fig. 2.

Fig. 3.

by a small glass tube. Fig. 2 illustrates the E. J. intensifier made by Mr. E. J. Willis, of 8, Park Place, New York. A wire from the coil is attached to one end, while to the other is fastened a wire leading to the plug. The gap is adjustable and is enclosed in a small glass tube. Fig. 3 shows another device which is attached to the plug and in which the gap is enclosed. It is made by the Star Supply Co., of Attleboro, Mass., U.S.A.

MARIN COUNTY, California, has secured a place on the list for the enactment of freak automobile regulations, by issuing an order prohibiting motor-cars from using the roads between sunset and sunrise. The Automobile Club of California has decided to test the legality of the regulation in the case of one of its members who was arrested for being out at 9 o'clock one evening.

THE accompanying illustration shows the little car which the Canterbury Motor-Car Company has lately introduced to meet the demand for a reliable little vehicle at a popular price. The motive power is supplied by a 6-h.p. De Dion, or 6½-h.p. Aster engine set in the forepart of the frame under the bonnet. The water circulation is normal and maintained by a pump and radiator, but is so arranged that should the pump fail it will continue

The "Canterbury" Light Car.

on the thermo-syphon system; the water tank being placed well above the engine. Three speeds forward and a reverse, controlled by a lever at the side, are provided, the power being transmitted through a clutch, gear box, cardan shaft, and bevel gear to the rear live axle. On the high gear the power is transmitted direct, and it is claimed that by means of the throttle any desired speed from 6 to 20 miles per hour can be obtained with the third speed in gear. A pedal-actuated band brake is fitted on the countershaft, while a hand lever controls internally expanding brakes inside drums connected to the hubs of the rear wheels. All the brakes are of the double-acting variety, and are so connected that the first result of applying either the hand or foot brakes is to withdraw the clutch and thus disconnect the engine from the transmission mechanism. The car is furnished with a two-seated body as illustrated, or can be provided with a tonneau. Mr. H. Pavillet, of the Canterbury Company, informs us that since the exhibition at the Agricultural Hall in March last he has driven one of these cars several thousand miles, with no more trouble than the breaking of a trembler.

MOTOR vehicles were shown at the South Kildare Show by Messrs. Duthie and Large, of Athy.

THE Wolverhampton and District Automobile Club will hold a run to Kinver to-day (Saturday).

A NEW catalogue of the White steam car has been issued which should be of interest to motorists generally. It is arranged and produced in an effective style, letterpress and illustrations alike being good.

A COMMITTEE of local residents has been formed at Gohren, near Leipzig, with the object of organising a public service of motor-cars between the two places.

THE Cleveland Trust Company, a leading banking institution in Cleveland, O., has placed in service an electric motor delivery wagon for carrying packages of valuables to and from the storage and safe deposit vaults of the company.

PRINCE FRIEDRICH VON HOHENZOLLERN has lately acquired a 10-h.p. Benz-Parsifal car.

THE Bournemouth Corporation has recently put a motor street watering cart in service.

TO-DAY (Saturday) the members of the Sheffield Automobile Club will hold a run to Matlock Bath.

Mr. T. H. HOLDING's specialities in motor clothing can be obtained from Messrs. Farman and Co., Long Acre, W.C.

A PIT for automobile inspection has been established at the White Hart Hotel, Banbury.

LORD FITZHARDINGE regards automobiles as "hateful, stinking murder cars." No wonder there is a good deal of scepticism among motorists as to the kind of justice with which they are likely to be treated.

IN the course of the discussion of the Motor-Car Bill in the House of Commons on Tuesday, Mr. C. J. Murray said the motor industry had taken root in his constituency (Coventry), and employed some 2,500 workmen, who produced last year 8,000 motors.

SINCE the Irish Fortnight Mr. A. Govan, of the Hozier Engineering Company, has been touring on the 16-h.p. Argyll car which ran in the Phoenix Park Races, and during twelve days covered just on 1,400 miles. Leaving Glasgow, he ran south *via* Carlisle, Kendal, Leeds, Nottingham, London, to Littlehampton, where he stayed a few days, using the car to run backward and forward to London. From Littlehampton he returned to the north *via* Brighton, London, Reading, Southsea, Bristol, Cardiff, Gloucester, Worcester, Birmingham, Manchester, and Bowness (where a day was spent), Carlisle and Lockerbie. This test amply proves that although the new Argyll car, for its horse power, is exceedingly fast, it is also reliable.

The Foulmaron Motor Car. (See page 446.)

THE Crabbe Brake Company, Limited, has been registered with a capital of £35,000, to acquire that branch of the business carried on by Components, Limited, which relates to the manufacture of Crabbe Brakes; to adopt an agreement between Components, Limited, of the first part, F. Warwick of the second part, C. T. B. Sangster of the third part, and H. Witton (for this company) of the fourth part; and to carry on the business of manufacturers of and dealers in the Crabbe Brake and all kinds of motor-car and other brakes.

THE HORSE POWER OF PETROL MOTORS.

THE article we published on this subject in our issue of the 25th ult. is attracting considerable attention. In our last number we published the views of the Star Engineering Company and the Duryea Motor Carriage Company on this important question, and below will be found the opinions of two other well-known British automobile designers.

Mr. Maudslay Brooke, of Messrs. J. W. Brooke and Company, Limited, Lowestoft, writes:—"I have read with very much interest the article in your issue of the 25th ult., on the h.p. rating of petrol motors. I am very glad indeed to see that you have introduced this subject, and hope now that it may be carried to an issue, for there is not the slightest doubt that it is one that requires to be put on a firm basis. It will have two results: first, the purchaser will know what he is buying, and second, it will not give one manufacturer an unfair advantage over another.

"With our own cars I have had a difficulty and have not the slightest doubt other manufacturers have had the same. Our early motors at normal speed gave 13½ h.p., we called them 10; our new motors gave 14 to 14½ h.p., we called these 12. Messrs. Wellington come along and take our output and call the motors by their actual h.p., viz., 14, but all the time the purchaser is none the wiser and possibly thinks that there is an actual difference in the powers of the motors. My object in understating the h.p. was that a 10 h.p. Brooke should be a little better than a 10 h.p. something else, and of course I know for a fact that other makers were understating their h.p.

"It is difficult to know exactly how to overcome the difficulty, but it appears to me that the system suggested by M. Hospitalier is the correct one, except that his standard would not be in accordance with modern practice. I find that the Brooke motor works out 155 litres per min. per h.p. piston displacement, which you will see is below the average given in your table, and is no doubt accounted for by the fact that I have taken the actual h.p., whereas the others are evidently the assumed h.p., which are generally understated.

"If the Automobile Club would insist that the h.p. of all cars taking part in their trials should be stated on a basis originated by them, I have no doubt it would soon become a standard in this country, and if carried out on the lines suggested by M. Hospitalier it would be a simple matter to make the calculation for any foreign cars brought into this country. Of course it would be necessary for the manufacturer to give the normal speed of his engine—that is to say, the speed at which the claimed top speed is obtained."

Mr. Alec Govan, of the Hozier Engineering Co., Ltd., writes:—"With regard to your article on the horse power of petrol motors, you are opening up a very wide question full of controversy. I do not consider it possible or desirable at the present stage of the industry to lay down a formula to determine the horse power of motors, my reason being that different makers have arrived at various speed maximums, each one maintaining that the firm who run their engines faster than they do are knocking the engines to pieces. While this argument is getting a bit antiquated, it still flourishes in some quarters, but the fact remains that, generally speaking, the average speed at which motors are being run is gradually being accelerated, and what was considered a fast speed yesterday is to-day accepted as being a reasonable rate. So long as the controversy continues, both the cylinder capacity and the cylinder displacement would be misleading to the public, because it has been amply demonstrated that where one firm has failed to make a satisfactory high speed engine another firm has made it a great success, and of course, generally speaking, the greater the speed the greater the efficiency, providing that the engines are properly made to stand the speed.

"The two remaining factors in connection with the motor are weight of the vehicle and efficiency of transmission. Here again opinions widely differ, and the popular fallacy still exists that weight means reliability; nothing could be more

misleading. A slow running engine means a heavy engine, a heavy engine means heavy frame and axles to transmit the power at the slow speed, the result being an inefficient car, and, owing to its own weight, although the factor of safety might be the same as in the lighter vehicle with the higher speed engine, it is not a bit more reliable. In conclusion, my views therefore are that the designer who can get the most out of a given cylinder capacity deserves the greatest credit. The history of engine speeds proves that it is mere presumption on the part of any man to say that any speed is too fast. With regard to the efficiency of transmission, this can only be tested on mechanism designed for the purpose, but there can be no doubt that the

Count and Countess Poninski on their Renault Car on which they recently toured from Nice to Dresden

[Automobil Welt.]

light vehicle makes the most efficient car, and is the least expensive to run. Still further, a greater efficiency can be got out of a given cylinder capacity, and this is the factor that would make any formula devised misleading to the public."

MESSRS. RAWLINGS BROS., LIMITED, inform us that at their establishments at 82, Gloucester Road, South Kensington, and at 165, Sloane Street, Chelsea, facilities are now available for the charging of batteries of electric vehicles at all times. Current up to 400 amperes can be supplied at any pressure not exceeding 200 volts.

THE Engineering Standards Committee have decided to form a sub-committee, with Mr. Worby Beaumont as chairman, to deal with the question of the standardisation of the size, weight, power and E.M.F. of the boxes of accumulators that are necessary to drive electrical motor vehicles. Lieut.-Colonel R. E. Crompton considers that the electromobile in its present form only requires careful management in one point, that is as regards the care of the accumulators, and that in our present state of knowledge all that is necessary to deal with this defect is that the users should have as little to do with the charging, care, and upkeep of the accumulators as possible; in other words, that the future of electromobilism is at present solely a question of the establishment of suitable organisations for the furnishing at many charging centres of properly charged accumulators, which can be readily put into any vehicle at a few minutes' notice.

CORRESPONDENCE.

MOTOR-CAR RACING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your issue of the 25th July the Duryea Motor Carriage Company are wrong in saying that I am getting away from the original argument with regard to motor-car racing. I should like to have the Duryea Company's proof that the firms I mentioned in my last letter have given up horizontal engines in place of vertical ones "because the latter is fashionable."

They say that they would like to know where I get my figures from, namely, £4,320,000 as a result of France winning the Paris-Berlin race. I refer the Duryea Company to page 240 of the "Motorist's Year Book." I will quote the sentence:—"Consul-General Inglis has officially stated that the actual result of the Paris-Berlin race was the placing of orders with French firms to the value of £4,320,000." Surely he would never put this into print if it were not true.

I never said that in a race any car was silent. What I said was, that a fast car need not be noisy. Look at Mr. Cordingley's 40-h.p. Mercedes? Surely this would be considered a fast car, and at the same time a very silent one. Compare the car I have just mentioned with a 40-h.p. Panhard (Paris-Berlin type). Both cars the same power, one like a steam car, the other like a Gatling gun. Manufacturers saw the Mercedes at last year's Nice week, copied it, and consequently we have fast, high-powered cars to-day, and at the same time silent ones.

I don't doubt for one minute that Jenatzy's car was very noisy,

There will in all probability be a conference of provincial clubs (attended by representatives, as agreed upon to date, of eight clubs from all parts of England, and possibly of more), held in London in October, to debate this question and make, with all due deference, suggestions to the A.C.G.B.I. about the terms of affiliation. It is very much to be hoped that the time, trouble, and expense incurred will receive the attention its representative character will warrant.—Yours truly,

EDWARD CRAGG,
Hon. Sec. Lincolnshire Automobile Club.

EXAGGERATED REPORTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should like to draw the attention of the readers of *The Motor-Car Journal* to the infamous reports of accidents which happen to cars in the daily papers. Being a driver in the employ of a well-known doctor in Leatherhead, I was driving last Saturday week toward Effingham, and in coming to a cross road which leads from Leatherhead to Guildford, by the "Blucher Inn" at Effingham, I was requested to slow up by my employer and I did so. I had blown the horn a few seconds before and was just about to cross the road (which was chalky and greasy at the time) at about six or seven miles an hour, when a pony trap coming from the direction of Guildford came out in front of me. The pony was trotting as fast as it could go, and the driver, instead of going on as he should have done, slowed up in front of me. Up to this time I did not apply the brake, because of the nature of the road and thinking that the trap

A "Maurer-Union" Car in the Austrian Tyrol.

TOURING SNAPSHOTS.

but get the car ready for touring and then hear the difference, although it is 60 odd horse power. Do the Duryea Company mean to insinuate that because the Mercedes Company have adopted throttle control, it is a copy of their cars? Why do they say that as much credit goes to England as to Germany in connection with the Goraon Bennett race? Germany won, England lost, and therefore let us own up like men and acknowledge that the German car was faster and more reliable than ours, and don't let us go looking round for excuses that are "non est," and say that if the tyres, etc., had been all-right we should have won. This, in my opinion, is a very un-English and unsportsmanlike way of taking a beating.—Yours truly,

ST. J. C. NIXON.

AFFILIATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have had opportunities in the past few weeks of talking over the affiliation question with one or two members of the A.C.G.B.I. who are not members of this club. The reply in each case made to my statements on the question has been, "But do you not have various privileges, such as the use of the club or garage for certain limited periods in return for your affiliation fee?" It is obvious that some members of the A.C.G.B.I. at least are in favour of a reasonable settlement of this burning question.

We disclaim any idea of opposition to the A.C.G.B.I., which would be a mistaken attitude to assume when the Club is doing so much for automobilism. But there is a very general feeling among provincial clubs that there should be some recognised terms of affiliation, where, if something is given on one side, an adequate return is made on the other.

would go on; but when I saw it pull up I applied the brake rather hard; when about a yard and a half from the trap the wire which operated it broke and the car slowly collided with the back wheel of the trap. The starting handle of the car caught in the felloe of the trap wheel and the pony in trying to get away bent it round, so releasing the car from the trap. I noticed, as the car was released, that the driver was still in the trap, then, being on a slight gradient, the car ran on a few yards, my side brakes slipping. I stopped the engine and walked back to see if any damage had been done. The owner of the trap was walking round, the axle was bent, but everything else was intact. After this the owner drove the trap five miles without it being touched, although he seemed to be, well—very much shaken. I did not notice any mud on his clothes to denote that he had been thrown out, but the report which appeared in the local paper ran like this:—

"A NARROW ESCAPE.—On Saturday morning last an accident occurred, which might have possibly resulted in very serious consequences, between a motor-car belonging to Dr. A. R. S. Freeland, and a pony trap belonging to, and driven by, Mr. T. J. Leavey, of Leatherhead. The scene of the accident was the cross roads at the 'Blucher Inn,' on the Effingham Road. Mr. Leavey was proceeding toward Leatherhead when the motor-car shot out from the cross road and dashed into his trap, smashing it to pieces and throwing him into the road, only just escaping from striking his head against a brick wall, but happily he was only shaken, and was able to walk home all right."

I am sure this is only one case out of hundreds, but it is this reporting business that makes people absolutely frightened of motor-cars.—Yours truly,

J. E. SCALES.

DE DION GEAR QUERIES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—When the high-speed clutches of a De Dion gear are put into action a peculiar singing sound is produced, this varying in intensity in different cars. In my little car the sound is, I should think, ten times louder than that produced by any other I have ever heard. Can any of your readers tell me the cause of this and the remedy?

The fibre bands upon the clutch blocks have never been renewed. They appear to be quite good after running about 19,000 miles, and they grip quite well. If the fibre requires renewal, how can the strips sold for the purpose be bent into shape? I have tried boiling water, but it does not make them sufficiently pliant. When the fibre strips have been bent and fixed in place I suppose they must be turned up on a face plate?—Yours truly,

G. WASHINGTON ISAACS.

"AUDIBLE WARNING."

DR. LAWTON, Birkenhead, was summoned at the Neston (Cheshire) Petty Sessions, under the Light Locomotives Act, for being in charge of

police. Witness was the owner of three motor-cars and a motor-bicycle. Other witnesses who did not witness the accident, but who were in the vicinity, gave evidence that defendant continually sounded his horn. The Bench dismissed the case.

MOTOR VEHICLES AT THE ROYAL LANCASHIRE AGRICULTURAL SHOW.

At the show of the Royal Lancashire Agricultural Society, which concluded this week at Manchester, one of the most interesting departments was undoubtedly that devoted to motor vehicles. It has been for long alleged that to have seen one agricultural show meant to have seen all, but this criticism no longer obtains. In passing over the ground at Old Trafford our representative made one or two notes, as follows:—

Messrs. Cockshott and Co., Limited, of New Bridge Street, Manchester, had an excellent display of the "Stanley" steam cars, and "Rex," "Velox," and "Northern" petrol vehicles. Messrs. J. A. Lawton and Co., of Liverpool, also showed a "Velox," with aluminium body, as well as examples of the latest Daimlers and Panhards. Petrol cars were also shown by the Vulcan Motor Company, of Southport. Messrs. Hayes and Son, Scotgate Works, Stamford, had on view an electric-propelled cart, adapted

The Germain 15-h.p. four-cylinder Limousine.

a motor-car and failing to give audible and sufficient warning when necessary of the approach of the car on July 15th at Barnston. W. Williams, gardener at Oxton, said he was walking along the Barnston road when he was knocked down from behind by a motor-car. He heard no alarm or warning. Esther Newby said she was in company with the last witness, and she too was knocked down. She heard no bell or horn, or sound of warning. Witness was walking next to the road. The motor-car went into the ditch. Sergeant Dorrick said he saw Williams, who had a cut on the head. The place referred to was right on the top of Barnston Dale. At this point witness measured the road, and found that it was 4½ yards wide. The road was perfectly straight, and there was nothing to prevent a person observing the road for some distance in front. For the defence Dr. Lawton said he came through Barnston between seven and eight o'clock. Witness sounded his horn continually coming through the village, and all the way up the hill. When he got to the top he saw the couple walking along, and he sounded his horn 20 or 30 yards from them. Just as the car was passing them the young lady, who was nearest the hedge, gave the man what appeared to be a playful push, causing him to step out into the road. The splash-board of the car caught him, and carried him some distance, the car eventually landing in the ditch. Witness was not going at more than eight miles an hour. The young lady was not knocked down. Witness took the man home and put him to bed, and afterwards compensated him, before he heard of any proceedings being taken by the

for bread delivery. A large and interesting display of heavy vehicles was made, the exhibitors including the "Hercules" Motor Wagon Company, Manchester, who had on view one of their steam wagons, which will readily carry five tons and draw a trailer carrying three tons; Messrs. C. and A. Musker, Ltd., Liverpool; the Lancashire Steam Motor Company, and Mann's Patent Steam Cart and Wagon Company, Leeds. A novelty was the motor lawn-mower, shown by Messrs. Thomas Green and Sons, Leeds.

CLAIM FOR DAMAGES.

AN action for the recovery of damages for personal injuries alleged to have been caused through the negligence of the defendants in the driving of a motor-car was brought by Thomas Guest, collier, of Glasshoughton, against Messrs. Wharam and Barland, of the Grove Engineering Works, Claypit Lane, Leeds, at the West Riding Assize Court. The ground of the claim was that in consequence of the negligent and unskilful driving of a motor-car by the defendants the plaintiff was knocked down and received severe personal injuries. The defence was a denial of negligence, the contention being that if the plaintiff had suffered any damage it was due to his own want of care. In summing up his lordship said if the case was a specimen of what the courts were to deal with, it was clear that motor-car accidents were going to be most difficult problems to solve. The jury returned a verdict in favour of the plaintiff for £250, and his lordship gave judgment accordingly.

Where no alleged speed is given it is understood to be above the legal limit.

GERARD CHAPMAN, of Maidenhead, appeared before the Windsor magistrates on Monday for driving his motor-car at a greater speed than twelve miles an hour. The defendant, who answered a warrant, said that he did not appear in answer to the summons as his car broke down on the way to the court. Head-constable Nicholls stated that according to the newspapers, the defendant was fined £10 and costs on Friday last in Wales for a similar offence. The defendant: I am afraid that was so. It would have cost me about £4 to go down to defend the case, so I let it go by default. The magistrates fined him £5 including costs.

THE adjourned hearing of the charge against the Earl of Ilchester of driving a motor-car at excessive speed at Stoke-next-Guildford on June 12th took place before the Guildford County Bench on Saturday, when his Lordship was fined £3 for the speed offence and £3 for endeavouring to get away from the police. Sergeant Jarrett, giving further evidence, stated that his measured distance of 176 yards included the dangerous

Boxgrove Road, which was in the middle of the course. The speed was twenty-three miles an hour. When the uniformed constable at witness's signal stepped into the road to stop the car it ran backwards in an attempt to rush the police at about twelve miles an hour. The Earl of Ilchester was cross-examined by the redoubtable Sergeant Jarrett, who asked:—Do you think I should have hung on to the car if I had been satisfied?—You ought to have been satisfied. Jarrett: Is it usual for an innocent man to run away from the police? His lordship hesitated, and Jarrett added, "Answer my question, please." Lord Ilchester: I was not running away from the police. Did you not think it very disrespectful to call a policeman worse than a crossing-sweeper?—I did not say so. If I said anything of the kind, it was with reference to the setting of motor traps. Viscount Knutsford (a magistrate): The sergeant was stationed there, and it was his duty, and I can't see why he should be abused for doing that. After a short consultation, the Chairman (Sir William Chance), in passing judgment, said that Lord Ilchester was not, as stated, exactly rushing the police, still they thought he was trying to get away. Sergeant Jarrett was perfectly right in trying to get the driver's name.

THE MIDLAND HILL CLIMB.

THE official results of this contest are as follows, although at the moment of writing the actual winner of the President's Cup had not been made known:—

Car.	Weight. Lbs.	Net Time. Secs.	Score.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

VOL. V.]

LONDON, SATURDAY, AUGUST 15, 1903.

[No. 232.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE Post Office motor-van, which is running every night between London and Epping, has had many narrow escapes through the tendency of hay carters to go to sleep on the road and leave their horses to take their own way. At last the Postmaster-General has had to address a letter to the Essex police asking them to warn the carters. One result has been that eighteen drivers were fined small sums the other day at the Epping Police Court for being asleep or without lights. Frequently have we experienced the inconvenience and danger caused by drowsy drivers, who have no regard for others, and who will have to be taught many such salutary lessons as those recently given these Epping carters at the suggestion of the Postal authorities.

The Motor-car Bill.

FOR a whole day and away into the early hours of the morning the members of the House of Commons have been discussing the rights of motorists on the public highways, and how assiduous some have been in their attention to the subject may be gleaned from the calculation of a contemporary that Mr. Scott Montagu has made no fewer than eighty-three speeches in the course of the Parliamentary controversy. This number may be an exaggeration, but in any case we fear he has spoken too frequently to have impressed the House with the seriousness of the subject. In fact, if he had spoken less and said more, it would have been better. There is no doubt that the want of a clear, definite policy was felt by the friends of motorists, and it would have been wiser if they could have agreed to urge the postponement of the matter.

The Scotch View.

THE tone in which the Scottish Automobile Club has consistently opposed motor-car legislation, and the way in which the wisdom of their attitude has been demonstrated, should give that organisation greater standing in the automobile world in the future than in the past. The Lord Justice Clerk of Scotland, as president of the Club, Mr. Dawson Turner as vice-president, and Mr. Norman D. Macdonald as chairman, all wired to M.P.'s last week, urging the Bill to be blocked if the speed limit was brought below 25 miles. The Club always urged that in a few short years the position would right itself, and that there was no need for such premature action, and, as events have proved, such precipitate disaster. Our own view is that Scottish motorists will not suffer so much as those of this country. Scotland may be depended on to keep calm and cool, and the legal procedure north of the Tweed will probably be less irksome to motorists than here.

The Speed Limit.

A SPEED limit of twenty miles an hour has been inserted in the Motor-Car Bill, and thus the promised relief to motorists has been lost. We were to submit to all sorts of indignities which were to be cheerfully borne, and, in return for this, the vexatious and senseless speed

limit would be withdrawn. Such was the line of special pleading adopted in the early days of the agitation. But the limit has been re-enforced and although raised slightly will not make us any more content with the position than we were before legislating motorists trailed possible concessions before our eyes. Now, if any motorist goes beyond twenty miles an hour he will be liable on summary conviction in respect of the first offence to a fine not exceeding £10, in respect of the second offence to a fine not exceeding £20, and in respect of any subsequent offence to a fine not exceeding £50.

Identification.

THE clause dealing with the identification question now provides that—(1) Every motor-car shall be registered with the council of a county or county borough, and every such council shall assign a separate number to every car registered with them. (2) A mark indicating the registered number of the car and the council with which the car is registered shall be fixed on the car or on a vehicle drawn by the car, or on both, in such manner as the council require in conformity with regulations of the Local Government Board made under this Act. (3) A fee of £1 shall be charged by the council of a county or county borough on the registration of a car, and 5s. for a motor-cycle. (4) If a car is used on a public highway without being registered, or if the mark to be fixed in accordance with this Act is not so fixed, or if, being so fixed, it is in any way obscured or rendered or allowed to become not easily distinguishable, the person driving the car shall be guilty of an offence under this Act, unless he proves that the mark had been obscured or rendered not easily distinguishable by unavoidable causes arising from natural conditions over which he had no control. Provided that a person shall not be liable to a penalty under this section if he proves that he has had no reasonable opportunity of registering the car in accordance with this section, and that the car is being driven on a highway for the purpose of being so registered. Power is also given to a county council or county borough in which the business premises of any manufacturer or dealer are situate, on the payment of an annual fee not exceeding £3, to assign to such manufacturer or dealer a general identification mark which may be used for any car on trial without penalty.

Inland Revenue.

INCIDENTALLY the foregoing clause will be of great value to the Inland Revenue authorities, enabling them to easily obtain the names and addresses of owners of cars, thus facilitating their work and preventing motorists escaping the present tax. In view of the new legislation, motorists will be well advised in giving attention to this individual aspect of the matter.

Fine and Prison.

CLAUSE 9 as originally brought from the Lords read as follows:—"A person guilty of an offence under this Act for which no special penalty is provided shall be liable on summary conviction in respect of each offence to a fine not exceeding £20, or in the discretion of the Court to imprisonment

for a period not exceeding three months, or in the case of a second or subsequent conviction to a fine not exceeding £50, or in the discretion of the Court to imprisonment for a period not exceeding six months." This fortunately proved too much even for the most rabid anti-motorists, and an amendment was agreed to fixing the term of imprisonment which it was in the discretion of the court to inflict at a period not exceeding three months, instead of six.

Signposts and Servants.

THE signposts to be put up at dangerous corners, cross roads, and precipitous places are to be subject to regulations as to size and colours to be made by the Local Government Board, which will, we hope, secure uniformity both in text and colour, so that there may be no confusion on the part of motorists passing from one county to another. It has also been agreed that the Act shall apply to servants of the Crown—an important and necessary clause in view of the rumoured motor developments in the Post Office.

Chan Lye Mue, of the Chinese Consulate, Hong Kong, on his Georges Richard Volturette. *[La Vie au Grand Air.]*

Small Amendments.

THE final reading of the Bill in the Commons was marked by a significant incident in the courteous but firm rebuke of Mr. Long to Mr. Sinclair, who had put down a series of pettifogging amendments, and who, said the President of the Local Government Board, if he persisted in moving amendments of this kind, would be doing a greater injury to the motor traffic of the country than he could think of. Mr. Sinclair, we were glad to observe, quickly learned the lesson and refrained from moving several amendments he had framed.

The Licensing Question.

ON Tuesday the third reading of the Bill was carried in the Commons. Mr. Long proposed a new clause, which provided that any Court before whom a person was convicted of an offence under the Act, or of an offence in connection with the driving of a motor-car, other than a first offence, which consisted solely of exceeding any limit of speed fixed under the Act, might suspend a license of the driver, and declare the person convicted disqualified from obtaining a license for such time as the Court thought fit, and might cause the license to be so endorsed. In the case of a person who did not hold a license the Court might declare him disqualified from obtaining a license. A disqualified person might appeal in the same manner as a person ordered to be imprisoned without the option of a fine. After some

discussion Mr. Long admitted that so far as the clause applied to the professional driver there might be hardship in depriving him of his license for a first offence, which might conceivably be that of exceeding the speed limit by only a small extent. He accepted an amendment to that effect, which was subsequently agreed to. No one will be allowed to drive a motor-car without being licensed for the purpose, and drivers will be required to renew their license annually for a fee of five shillings. The age at which the licenses will be granted to drivers of motor-cars has been fixed at seventeen years, but licenses limited to driving motor-cycles may be granted to persons over fourteen years of age.

The Right of Appeal.

IN the midst of all the attacks that have been made on the position of the motorist one small mercy has been given. There is to be a right of appeal against the decisions of magistrates in cases where the fine is above twenty shillings. All along we have urged the necessity of adequate opportunity for appeal being given, and now that Mr. Long has recognised the point and dealt with it in quite liberal fashion, we would impress upon motorists the necessity of using the power thus given. A plethora of appeals with probable chances of reversions of judgment would do much to bring magistrates to a proper sense of the fitness of things.

Hopeful Mr. Long.

SPEAKING at Trowbridge on Saturday, Mr. Walter Long said they had been quarrelling over motor-cars in Parliament the previous night, but he hoped, whether they made mistakes or not, their legislation would be beneficial in two respects. He hoped it would foster a great and growing industry, and bring home to people who enjoyed the delights of motor-riding that they must use their cars in such a manner as to inflict the least possible inconvenience to the people of this country. He hoped motors would have a great future, both commercially and for purposes of enjoyment. There is no doubt as to the prospect of the latter hope, although we shall wait for its universal realisation until after the expiry of the Bill of the present year.

Only Three Years.

SOME idea of the want of finality that characterizes the Bill may be gleaned from the eagerness with which the House agreed to the clause proposed by Mr. C. Murray, the member for Coventry, who has rendered good service during the discussions. He suggested that the Act should continue in force till December 31st, 1906, and no longer, unless Parliament should otherwise determine. Seeing that the Bill does not come into operation till January next, it is only intended to have a three years' operation, by which time we anticipate the motorists in Parliament will be sufficiently numerous to make their arguments effective and their strength felt. How lukewarm has been the much-vaunted Automobile Party of a hundred members is clear from the fact that Mr. Montagu, in submitting a new clause at the end of the discussion, found only eighteen supporters. Had the motorists been keen in defence of their rights they could easily have secured some significant victories during the committee stage.

Official, and too Late.

AT a joint meeting of the Automobile Club and Legislative Committees of the A.C.G.B.I., held on Monday evening, the following resolution was unanimously passed, viz.:—"That although the Automobile Club has favoured, and does favour, any legitimate legislation which will prevent inconsiderate or dangerous driving of motor-cars at excessive speeds, and consequently agreed to identification, the Club still adheres to the opinion expressed by Mr. Long and supported by the County Councils' Association and the majority of the chief constables,

viz., that a specific limit of speed tends more to the public danger than to the public safety, and they are therefore opposed to a 20 mile per hour or any other specific speed limit, since it cannot fail to be vexatious and inefficient, and will undoubtedly seriously injure the automobile movement in this country, which if allowed free growth will undoubtedly, as in the case of the bicycle, lead to the evolution of vehicles suitable for general use by the professional and industrial classes." Why did not the spokesmen in the House give strong voice to this view?

What will the Lords do?

Now that the Bill, with all its harassing of the small motorist and the inconveniences it will impose upon the owner of means, has emerged from the Commons, there remains only one chance of improvement. We look to the Duke of Portland, Earl Shrewsbury, Earl Russell, Lord Hastings, and other noble motorists, to secure some reasonable concessions. It may be too much to hope that any alteration will be made in the principles of the measure, but there are a few points which well deserve fuller consideration. At the last moment a new clause was added giving the Local Government Board power to

A Reminiscence of Luther.

THE accompanying illustration shows a couple of Wartburg cars, of 8½ and 5½-h.p. respectively, ascending a road in the vicinity of the famous Wartburg Castle, near Eisenach. The castle, standing in lonely dignity on an elevation, is interesting because of its associations with Martin Luther, who was confined there for nearly a year at the instigation of Frederick, Elector of Saxony. His incarceration was really a device to save him from worse dangers, and during its continuance he began the translation of the Bible, which, however, was not completed till thirteen years later.

The Magistrates and the Law.

GREAT uncertainty seems to prevail in the magisterial mind as to what to do with motorists in view of the legislative action of Parliament. At Havant, the magistrates have inflicted nominal penalties of a shilling in three cases, in view of the Bill now before Parliament. At the West London Court, however, the suggestion that the police might stay their hand against motorists, pending the passing of the Bill, was scouted by the magistrate as unconstitutional. Mr. H. Pierron, who made the

Two "Wartburg" Cars on the way to the Wartburg Castle.

close to motorists any roads in the country not more than 16ft. wide. Why was such a clause added without previous notice and when discussion was practically impossible?

Closed Roads.

THIS is not a question affecting public safety or convenience, but Mr. Long's proposal will seriously affect tourists and consequently the hotel-keepers and others who are looking to the motorists to restore their chances of prosperity. In Devon and Cornwall, and in many parts of the Midlands, are roads which could be closed without any reason but that supplied by the prejudice of a couple of bucolic opponents of automobilism. As we have previously pointed out, local authorities have neglected their duties with regard to this matter, and it is possible that this neglect will be an important factor in the campaign against motorists. Certainly we are now at the mercy of anybody and everybody.

suggestion when appearing on behalf of the Earl of Carnarvon, pointed out that Mr. Balfour had suggested that the magistrates might stay their hands at the next Brewster Sessions until a Bill for the compensation of publicans was brought into Parliament, and he naturally thinks that principle ought to be applied to motor-car drivers. The magistrate offered no comment, but imposed a fine of £5, and thus ended the plea for suspension of operations.

Motor-Car Imports and Exports.

THE imports of foreign automobiles into this country continue on a very large scale, no less than 722 cars and cycles being imported last month, the value of the same being returned at £210,518. The value of the "parts thereof" is given as £25,429, so that we get a combined total for July of £235,947, as compared with £258,578 in June last, and £118,926 (representing 419 cars) in July, 1902. Some of the imports were only of a temporary character, being reshipped to foreign destinations. Thus last month the reshipments comprised 65

vehicles, amounting in value to £36,102, and £1,396 of parts, bringing down the net imports in July to £198,449, as against only £115,540 in the same month a year ago. For the first seven months of the year the net imports of motor-cars, cycles, and parts stand at no less than £1,221,492 (representing nearly 4,000 vehicles), more than double those during the same period of 1902. As regards the exports of automobiles of home manufacture, the shipments during the past month amounted to 59 vehicles of a value of £27,553. Of parts the exports attained a value of £5,589, making a combined total for July of £33,142 as compared with £22,364 in June last, and £12,799 (representing twenty-nine vehicles) in July, 1902. To the end of July 391 vehicles of British manufacture had been exported this year, these, together with the "parts," representing a sum of £166,031.

Our Hedgerows.

We have already mentioned that the jury adopted a verdict of "accidental death" in the case of the unfortunate accident on Sun Rising Hill. At the suggestion of Mr. H. C. Matthew, of Northampton, they have requested the County Council to improve the road by widening it at the corner where the accident happened, and by cutting the hedges, so that drivers can better see the danger ahead. This cutting of the hedges is a problem to which county councils and other local authorities will have to give earnest attention. Whilst the

Mr. P. W. Fawcett, of Sheffield, on his 12-h.p. Humber.

hedgerows may be the pride and glory of our English landscape, they are certainly a source of danger to motor travellers on the highway, unless they are kept properly in subjection and consistently trimmed. It is to be hoped that those responsible for other hills, besides those in Warwickshire, which have been the scene of motor mishaps, will take the warning that this accident has given.

Look to the Brakes.

IN connection with this unfortunate accident we would warn motorists to always see that their brakes are in good working order, especially when intending to tour in an unfamiliar district. The day is past when cars fail to climb hills or run safely down them, and after seeing Mr. Austin negotiate Patrick's Hill, Cork, no one should need assurance on that point. The Wolseley Company asked Mr. H. Sturme, of Coventry, to inspect the car which figured in the fatal mishap on the Sun Rising Hill, and he found that with the exception of the right hand driving wheel, the hub only of which remained, a burst tyre and smashed lamps, very little damage was done to the car, although it had rolled right over. He gave particular attention to the brakes, and found that the unfortunate driver

had apparently neglected to adjust his foot (countershaft) brake, which showed no signs of having been used; the drum was smothered with oil and the lever came down on the footboard without the brake going full on, so that little, if any, power could have been obtainable from it. The driver had evidently trusted to the holding powers of his side brakes for the negotiation of any steep hills he might encounter. These were leather-covered blocks working on the inside of the wheel flanges. They showed no sign of excessive use, the brake blocks not being worn away to any appreciable degree, though the surfaces were just charred over.

The Cause of the Accident.

THE brake would be subjected to great heat in descending such a hill as Sun Rising, which would account for the charring, but whether freshly charred leather, whilst hot, has any deterrent effect on the power of brakes, Mr. Sturme was not in a position to say. That these brakes were, however, in good order, and of ample power, was clearly shown by the fact that, when a new wheel had been put on, they without adjustment, held the car upon the hill. Not only so but as both engine and gear were in perfect order, the car was reversed up to and around the fatal corner, and was afterwards repeatedly taken round it, and finally down the hill on these brakes alone. It seems to the expert, therefore, that the driver attempted the descent of the hill without seeing that both brakes were in full working order, and apparently commenced the descent too fast. Whatever the cause of the speed, too high a rate for the road conditions was undoubtedly the reason of the accident, and if, as is surmised, the car struck a hump in the road, caused by a water gully, the added stress suddenly thrown on to the wheel on the other side would amply account for the tyre being forced from the rim and the wheel collapsing and overturning the car. So far as the brakes are concerned Mr. Sturme is convinced that, kept in order and applied with reasonable judgment, they were amply sufficient to hold the car down any hill.

The Colour of Cars.

AT Winchester, where the police have some well-prepared traps for wayward motorists, the Rural District Council has been assuming some sort of knowledge with regard to what is safe and convenient to the public so far as the speed of motor-cars is concerned. Not content with this, however, they have resolved that "cars which emitted smoke, vapour, or smell should be licensed seventy-five per cent, higher than those free from such nuisances, also that the Local Government Board should inform motor-car builders that cars painted a dull or dark colour were safest for horses to pass." This, we believe, is the first time that local authorities have attempted to dictate the colour in which owners of cars shall have their vehicles painted. It is becoming the custom for military people to advise that troops shall be dressed in khaki hue, to avoid too conspicuous an appearance in open country, and naval men are advising a greyish tint for the fleet, but that privately-owned motor-cars should also have their hues and colour dictated by an Official Department is quite an innovation. Probably the insistence with which the numbering crusade has been carried on both inside as well as outside the ranks of motorists is responsible for the ridiculous suggestion of the Winchester Council.

For Surveyors' use.

RECENTLY we have shown how useful the motor-car has proved to some surveyors of the Eastern Counties. Now it would appear that the utility of the automobile is being officially proved in the south-western district. At a meeting of the Wiltshire County Council, just held, Mr. Pinckney, in moving the report of the Finance and Parliamentary Committee, said that the new motor-car purchased for the Surveyor had already been of good service, for he found he could do his work much more expeditiously since he had had a car. The vehicle is an 8-10-h.p. Benz-Parsifal, supplied about a month ago by Messrs.

Eastmead and Bigg, of Frome, and it has been doing long journeys from Bradford-on-Avon to remote villages on the other side of the county. Several County Councillors have accompanied Mr. Abye, the surveyor, on his tours of inspection, and, on one occasion, the Chief Constable of the county took a trip across Salisbury Plain. We can thus reasonably hope that purchase of a motor-car for a County Surveyor will prove an educational influence on members of local authorities, as well as an economy for the county itself.

Numbering in Canada.

MR. H. C. BLACK, of the Provincial Secretary's Department, has met the members of the Toronto Automobile Club to discuss the operation of the new law requiring each automobile to bear a registered number for purposes of identification. Mr. Black suggested a black enamelled leather groundwork, with the figures in white leather, stitched on, and the seal of the department at the bottom in gold letters. Those present approved of the idea of the department, and this scheme will be adopted. The owner of every automobile will then be registered in the department. Another matter discussed was the entry into Canada of American machines for touring purposes without the owners having to pay the duty at the frontier. The suggestion was made that the different automobile clubs of the United States should work under a national association, the latter to put up a fund of, say, 5,000 dollars, with the Dominion Government. Automobiles then could enter Ontario, receive the identification numbers of the Ontario Government, and if they were not returned to the States the duty would be paid out of the fund. This suggestion will be placed before the Dominion Government.

Ireland's Scheme.

THE Iveagh-Pirrie scheme of motor transit for Ireland is being carefully thought out, and, as already announced in these columns, three commissioners are now travelling the country with a view to studying the lines upon which the final report will be made. Mr. Malcolm is the engineering expert who will consider the nature of the cars required, their freight-carrying capacity, the nature of the roads to be traversed, and other matters dealing more particularly with the motor-car aspect. Mr. Bailey, who has had considerable experience with the South-Eastern Railway Company, is investigating questions of transportation, packing, etc.; whilst Mr. Callaghan will fix the rates to be charged upon the various classes of freight. All this is very satisfactory, but we wait with considerable interest their report and the promise of a definite date for starting the scheme.

Save us from our Friends.

JUST before going to press we learn that the indignation and alarm with which motorists view the Motor-Car Bill as it now stands were reflected at the joint meeting of the Legislative and Club Committees held on Monday last. The Committees were unanimously of opinion that automobilists were better off under the existing law, even with the twelve mile per hour limit, than under the new one that is now before the Lords. The chairman and administrative secretary reported that they had endeavoured to secure the withdrawal of the measure upon the introduction of the twenty mile per hour speed limit, but their efforts had been nullified by reason of the fact that Mr. Montagu's Parliamentary Committee had agreed to accept the Bill, and to facilitate its passage through the House. The joint committee thereupon passed a resolution calling upon "Mr. Scott Montagu, as a vice-president of the Club, to make known to the House of Commons that the acceptance of the speed limit was expressed without the sanction of the Automobile Club, and that the Club entirely dissents from the views of those who, on this question, were considered to be acting as the representatives in the House of Commons of that organization." Later in the evening a deputation consisting of Mr. Wallace, K.C., Col. Crompton, and Messrs. Calthrop, Staplee Firth, C. A.

Pearson, and Rees Jeffreys, went to the House to ascertain what opposition could be offered on the Report stage. They found little encouragement in the attitude of the recognised representatives of automobilism, but Mr. Dalziel and Major Jameson, M.P., however, who have already established a very great claim upon automobilists for their vigorous opposition to the Bill in the previous stages, kindly consented to continue the fight during Report. Altogether the position is aptly summed up in the title of this comment.

The Lords Adopt the Amendments.

THE House of Lords held a special sitting on Wednesday afternoon, when Lord Balfour revived the engaging topic of speed-limit on the consideration of the Commons amendments to the Motor-Car Bill. In explaining the changes that the Lower House had made, he said the only important alteration was the speed limit of twenty miles an hour. This he feared was a tactical mistake. The outstanding objection to a speed limit was that it must tend to obscure the real importance of the provisions of the first clause, which enacted heavy penalties for furious driving. Taken by itself a twenty-mile limit was not of much importance for the protection of the public. Speaking for himself, he would have liked to see the Bill without any arbitrary speed limit, but in face of the strong feeling in the Commons he felt that it would have been difficult to pass the measure without it. Earl Spencer expressed the opinion that the imposition of a speed limit would be exceedingly difficult to carry out. Nevertheless the Commons amendments were agreed to en bloc.

A word to Horse Drivers.

A CORRESPONDENT calls attention to a growing practice of horse drivers stopping motor-cars merely because they are somewhat nervous. Invariably the horses take no heed of the automobile until the driver notifies its presence by violent tugs at the rein, and in other ways alarming the animals. Care and intelligence should be exercised by horse drivers as well as by drivers of automobiles.

BARON DE REUTER, Mr. J. Hozier, M.P., and Mr. C. T. Yerkes have been elected members of the A.C.G.B.I.

THE directors of the Motor Manufacturing Co., Ltd., report that for the year ending May 31st, 1903, the net profit on the trading is £10,045. The gross sales have increased 61.84 per cent., and the cost of production has been very considerably reduced. The directors recommend that a dividend at the rate of five per cent. per annum be paid, and that the balance—£6,882—be carried forward.

THE official view with regard to the Parliamentary Committee on Automobilism formed to conduct the automobilists' case in the Commons is that it was little in evidence, and some of the hardest fighting for the A.C.G.B.I. was done by men who are not members of the Club, nor, in all probability, motorists themselves. Mr. Dalziel, in particular, made a most earnest effort to protect automobilists against vague charges of exceeding the speed limit, while the militant Mr. "Tim" Healy and the downright opposition of Major Jameson succeeded in winning some small concessions.

UNDER the auspices of the Derby and District Automobile Club, a hill-climbing competition was brought off on a road between Ashbourne and Belper on Saturday. Turnditch Hill was selected, a mile in length, which exhibits a variety of gradients, making it an ideal one for testing cars. The final acclivity in which the hill terminates is very steep, and represents a gradient of about one in six. Sixteen cars and some eight or nine cycles competed. In the car class the fastest time was recorded by Mr. Astle, of Wilne, who drove a De Dion up the hill in 3 min. 30 sec., and next came Mr. Sayer, of Derby, on a Serpollet steam car, who did it in 3 min. 32 sec. In the motor-cycle class the Excelsiors were to the fore, and Mr. Smith made the excellent time of 2 min. 38 sec. The starter was Mr. Leech, and Mr. Allin acted as judge.

THE "ALPHA" PETROL MOTOR.

HEREWITH we give two sectional views of a new petrol motor which has been put on the market recently by Messrs. Johnson, Hurley, and Martin, of the Alpha Motor Works, Coventry. It is capable of developing 12-h.p. on the brake at a speed of 800 revolutions per minute. It has twin cylinders standing on an aluminium base chamber which carries suitable brackets or attachments for fixing the motor to the car frame. The two cylinders are of cast iron, water jacketed; they are each 4 3-16 in. diameter by 4 1/2 in. stroke. The inlet and exhaust valves are mechanically operated and interchangeable. The inlet and exhaust valve lifters are also interchangeable. A carburettor of the Phoenix float-feed type, with throttle in the gas

outlet, is employed to furnish the mixture. The crank case is of aluminium and the brackets carrying the enclosed valve gear are in communication and lubricated from the same, the whole being oiltight. Large gun-metal bushes are fitted to the crank case, these being lined with "Hoyt" white metal. The crankshaft is of mild steel with a collar carrying a fly wheel 16 in. diameter, with conical space bored for the driving clutch. The cam-shaft is of mild steel and is fitted with a gun-metal toothed wheel actuated from the crankshaft by a pinion of vulcanised wood fibre half the size. The pistons and the bearings of the connecting rods, camshaft and crankshaft are lubricated in the usual way by splash.

MESSRS. EVART-HALL AND COMPANY have just supplied a 24-h.p. Darracq car to the Duke of Portland.

FROM the Lytham Ratepayers' Association comes a small but useful guide to Lytham, one of Lancashire's increasingly popular seaside resorts.

AT the forthcoming meeting of the British Association, a paper entitled "The Problem of Modern Street Traffic" will be read by Lieut.-Col. Crompton.

AN automobile club has just been formed in Havana, Cuba. The club will make a special effort to induce American automobilists to visit Cuba next winter.

A NEW garage, capable of accommodating twenty cars, has been established by Mr. E. Mens, in Palmerston Road, Boscombe. The garage is equipped with inspection pit and all the necessary plant for carrying out repairs.

THE Bournemouth Town Council has decided in favour of a new bye-law requiring hooded vans used in the town to be so constructed that the approach of vehicles from behind or from either side can be seen by the driver.

THE Electromobile Co. recently asked the Town Council of Maidenhead to provide housing accommodation at the electricity station for electrical cars when charging. As the electrical engineer reported that the business of charging the batteries of electrical vehicles was a growing and profitable one, it was decided to comply with the request.

LINCOLNSHIRE MEET.

JUST now the Lincolnshire Club is having a series of meets holding them weekly almost, to-day's (Saturday) run being to Skegness. On Saturday last, Dr. W. Gilpin, Bourne, entertained the members, and in acceptance of his invitation there was a very strong muster, some thirty-five cars and about twelve motor-cycles turning up at Grimsthorpe Castle, the beautiful seat of Earl Ancaster, near Bourne, the park having been placed at the disposal of the club by his lordship. Several of the members were conducted over the castle, and inspected its treasures and beauties, and then all the cars, etc., were driven through to the Red Deer Park, where, in the chestnut avenue, Dr. Gilpin had arranged a very nice picnic. Prior to sitting down to tea there was a hill-climbing competition for a prize offered by Dr. Gilpin, and the climb proved very interesting. The cars were sent off from a standing start at the hollow at the foot of the hill, so that, though the gradient was not particularly steep—on the whole it averaged 1 in 18—the cars could get no "way" on. We understand the handicapping to be the weight \times 10,000, divided by the h.p. \times by the time in seconds. Dr. Gilpin was the starter, Dr. Husband was timekeeper, and Mr. E. Cragg, M.D., the hon. sec., was at the finishing point.

The times were as follows:—

Entrant.	Car.	Mins.
W. S. Foster, Lincoln ...	9-h.p. Clement ...	1-275
W. R. Pennell, Lincoln ...	10-h.p. Locomobile ...	—
C. Holland, Boston ...	5-h.p. Baby Peugeot ...	2-185
Dr. Miller, Wrangle ...	—	2-235
R. M. Wright, Lincoln ...	6-h.p. De Dion ...	1-245
B. Smith, Horbling ...	—	3
(stopped too soon.)		
J. D. Sanders, Gainsborough ...	16-h.p. Siddley ...	2-100
Capt. H. E. Newsum, Lincoln ...	12-h.p. Richardson ...	1-200
Dr. Reckett, Boston ...	5-h.p. Baby Peugeot ...	2-125
M. Tryon, Stamford ...	6-h.p. Pick ...	2-075
A. A. Padley, Market Rasen ...	6-h.p. De Dion ...	1-230
(Driven by R. M. Wright).		
M. Tryon, Stamford ...	10-h.p. Pick ...	1-275
Dr. Benson, Deeping ...	6-h.p. Pick ...	1-275
F. Richardson, Sibsey ...	10-h.p. Wolseley ...	1-230
Dr. Gilpin, Bourne ...	8-h.p. Peugeot ...	1-275
M. Smith, Horbling ...	—	2-175

In the handicap F. Richardson was declared the winner with 223 points. The next three were Dr. Gilpin, 215, C. Holland, 192, and Capt. H. E. Newsum, 182.

After tea there was a motor-cycle hill climb, the start being from a little way up the hill, beyond the starting point of the cars, and thus gave a bit of a send off. The cycles were run off in pairs, and in the final Mr. Pogson, Sleaford, 2 1/2-h.p. Minerva, was the winner by a short distance from M. Gilbert, Billinghay, also 2 1/2-h.p. Minerva, but as Mr. Pogson was not a member of the club he had to be content with the honour, Mr. Gilbert taking the prize. No times were taken.

The picnic was a most enjoyable function, but there was so much to do that the meeting of the committee could not be held. The tables were laid out in the chestnut avenue and the tea was altogether *al fresco*. The journey home, to almost all parts of the county, was commenced about 7 o'clock, after a very pleasant time.

SOME trials with motor fire engines are about to be made at Charlottenburg, Germany.

TO-DAY (Saturday), the Kent Automobile Club will hold a run from Maidstone to Sevenoaks.

MESSRS. HUMBER, LIMITED, have opened a motor-car depot at 13, Cambridge Place, Paddington, W.

THE Empress Eugenie, who is at present in Paris, has taken to the motor-car, and went out in one last week to St. Gratien.

DURING the September Reliability Trials a Chelmsford steam car will be used as the official "supplies" car, carrying 200 gallons of water, a supply of spare parts, tyres, etc., for sale to competitors.

TOURING BY MOTOR-CAR.

FOR the automobilist who, having come to a mastery of his car, discovers within himself a desire for new worlds to conquer, there arrives a new and interesting plane of experience. He bids adieu to much that he has been accustomed to in other forms of travel, and takes up a round of new things. It is, first of all, a far step from the innate intelligence and companionship of the horse to the mute power and mere possession of the road motor. To accustom one's self to the change—with the radius of operation multiplied in the process—may often call for preliminary mental discipline, as well as for additional practice of the more tangible sort.

This is due in large part to the greater demands made upon the driver of a motor-car. One may share the ecstasies and the dangers of a trip with a fleet four-footer; relax attention now and then; feel that the responsibilities of the journey are not wholly his, and trust to a discriminating sense in avoiding the perils of street and highway too clever to be merely automatic. But the power-driven vehicle is wholly and directly in the care of the person at the wheel or lever. So long as all goes well, he is the most independent and the most absolute monarch locomotion ever produced, for even the railway engine-driver with the right of way in his pocket is subject to "orders" and signals. But when anything serious happens to the lone motorist, no wayside beggar is, for the time being, so poor or so helpless. Nowhere else is the personal equation of such large relative importance.

Recognising these essential qualifications, and working in league with them, rather than in ignorance or recklessness ignoring them, many special benefits at once appear. One has at his command a means of far-and-wide travel more rapid than cycling, more exhilarating than carriage driving, and—so far as operating cost is concerned—less expensive than railway transportation. The only limitations are those general ones of good roads, fair weather and time.

Travellers by motor-car have unexcelled opportunities for the study of nature and places, and for sightseeing in general. They are independent of time tables, and need not hasten from that which satisfies, or stay when interest flags. Wherever the tourist guides his car, by copse or cliff, in modern village or through ancient town, midst abbey ruins or along secluded valleys, on the borders of lake or mountain tarn, by the side of fringed streams, along gloomy defiles, or to some quiet seaside resort, he cannot fail to be benefited physically and mentally by the ever-changing environment of his holiday.

To be enjoyed to the full, a long journey needs a few preliminary runs, if necessary alone, but better in company with others, since companionship and conversation tend to an even pace and more interesting miles. These preparatory runs are especially desirable if one's vacation be taken in the spring. To come directly from a winter's inactivity to a week or month's continuous outdoor exercise is not always wise. The man who can go and come from business on his vehicle more or less regularly through the year is perhaps the best fixed of all in this respect; he is always ready, and needs only to arrange for his absence.

To lay out a motor-car tour, first determine upon a route through a section of country sure to yield sufficient interest and variety to pay for the time, work and expense involved. If this has been covered by some responsible party and maps and descriptions published, procure same, and use for general information and for suggestions. But, no matter how many helps the motor tourist has, he should travel by his own intuition, aided by a preliminary sketch, pencilled from the most acceptable map available. Then, from this map and all other sources of information combined, make entries beforehand in a convenient sized notebook of the principal towns and villages passed through or by, with the main distances of each from the starting point; and in a parallel column the approximate distances between the principal intermediate points. This will provide a daily working memorandum, giving possible stopping places for meals and lodging. More detail than this is not necessary, but optional with the tourist, who will soon discover that he can safely leave a great deal to be determined in the course of the trip. After each entry it is well to leave sufficient space for remarks, carefully avoiding, however, any not "fit to print."

As a rule, each person should work out for himself the best way to get from his home to the line laid down for some tour which he is anxious to undertake. Then, using the description or some of the maps already published, he will have a very practical suggestion of the best roads open to him.

The motor-vehicle already in satisfactory everyday service is ready for any ordinary tour after a careful inspection, especially of the motive parts and tyres. It is well not only to do this personally but also to have a competent mechanic or repairer do it, as a double safeguard. Opinions differ as to what should be included in the tool-chest, many motorists being content to go along with what is provided for them when the vehicle is purchased. Sufficient wrenches are supposed to go with the car, but the addition of a larger "pipe" wrench is

worth while. A hammer, screwdrivers, cutting pliers and a file ought to be included in the equipment; also a small vice for use in the emergency which sooner or later is sure to arrive.

A goodly supply of nuts, bolts and split pins will be carried, and care should be taken to replace them as fast as used. Spare sparking plugs, valves and valve springs, ready cut packings, cloths and cotton waste will come in handily sooner or later. Lubricants should consist of an oil can and grease injector, with an ample reserve of oil, grease, graphite, resin, French chalk and paraffin, all of which ought to be kept apart from the tools. Screw top cans make the best receptacles for these things. The petrol tank, or tanks, should, of course, be filled full at the start, and care taken thereafter to replenish it on the road well ahead of exhaustion, for, though almost universally procurable, the exception to the rule and the stranded vehicle will connect on the slightest provocation. It is well to go over all connections, as a loose wire is likely to give an irregular current, especially under vibration, and lead to a missing of explosions. In case of ignition by battery, the safest way is to use one fresh from the charging station, with an additional battery wired for use in the event of the first one giving out from any cause.

(To be continued.)

(La France Automobile.)

THE DELPRAT FLYING SHIP.

THE articles on "Mechanical Flight" which appeared in the columns of the *Journal* about a year ago attracted considerable attention, and brought under our notice several designs for new air-ships. Of one of these we are now able to give a diagram, together with some brief particulars. Its designer is M. A. Delprat, who has for many years given much study to the question of aerial navigation. After making many experiments with balloon-sustained and screw-propelled air-ships, he has abandoned these in favour of a machine with mechanically-operated flapping wings. Referring to the diagram, which is not drawn to scale, the section of the ship and the part of the wings within the same being enlarged relatively to the wings themselves, in order to show the disposition more clearly, A A are flat wings or blades, the flapping movement of which is in a vertical plane. B B are similar blades, having a to-and-fro movement in a horizontal plane. The inner ends of these blades are supported by, and are free to be rotated on, ball bearings, in sleeves which are themselves suitably supported. The alternating to-and-fro movement is mechanically given to the sleeves, and from them to the blades. S S S represents a three-cylinder motor, preferably actuated by petroleum-spirit. N is the engine shaft, on which are mounted the eccentrics or cams, D E F G, for operating the wings or blades. H I are sliding or rolling rods, the lower ends of which rest on the cams D E, while the upper ends bear on the sleeves U of the blades A. The rods are not

mechanically connected to either the cams or sleeves, but move to and fro under the action of the oppositely-set cams; thus, when the cams E are pushing up the rods I, and consequently the outer ends of the sleeves U, the inner ends of the latter are pushing down the rods H on to the cams D. Similar rods, not shown in the diagram, are provided to give a to-and-fro motion to the blades B. These rods are, of course, somewhat differently arranged, owing to the blades B being at an angle to the upper ones, A, and are actuated by the cams F G. Mounted on counter-shafts N' N'', above and below the main shaft, by which they are driven, are cams V V', of a special variable-incline form, and mounted so that while these must rotate with their shafts they can be moved laterally along them. It is by this means that the inclination of the blades, one to the other, can be varied; suitable connection being made between the special cams V V' and the inner ends of the blade. The mechanism is so arranged that as the blades A are being lifted by the rods I, those marked B are being pushed forward, the claim being made that the double-acting effect of oars in ordinary rowing is thus obtained.

M. Delprat argues that for a flying machine to raise itself and transport a person or persons in space, the proportion of the length of the part *a* of the blades to that of the portion *b* (the point of support of the sleeve U being the dividing line) must be smaller than the proportion between the number, *M*, of kilogramme-metres per second than that represented by the formula $4 P V + 2 M$, in which *M* is the power of the motor in kilogramme-metres per second, *V* the speed of the centre of action of the blade, and *P* the resistance to be overcome, the latter being the resultant of the total weight of the machine and the resistance of the air to its progress. By means of suitable levers, acting on the cams V V', the conductor

can set his flapping wings at any desired inclination, while a rudder is also provided for steering purposes. The weight of a flying machine, with its passengers, as above outlined, would be equally divided between (1) motor, (2) the hull of the ship, wings, etc., and (3) the passengers.

M. Delprat, who is a French civil engineer and a mathematical expert, has made some careful calculations as to the pressure of flying machines on the air during the action of flying, and the power required for their propulsion, and is incorporating these in an extensive treatise on the subject.

THE TENDENCY OF THE MODERN AUTOMOBILE.

LEAVING out the question of very high-powered cars, there can be but little doubt as to the three leading classes of cars, which now appear to have come to stay. Let us take these classes separately. Firstly, there is the two-seated single-cylinder voiturette of about 5 or 6-h.p., with or without a hood, eminently suitable for travellers and medical men, the price being between £150 and £200. This type of automobile is becoming more *en evidence* every day, and nearly all firms, whether large or small car manufacturers, are turning their attention in this direction, and are producing a reliable vehicle well within the reach of the pocket of "the man of moderate means."

Secondly, there is the medium-sized car. This takes the form of a comfortable four-seated car, propelled by a double-cylinder engine of about 8 or 9-h.p., its price being from £300 to £350. It is designed to carry four people with comfort, and is capable of averaging a good twenty miles an hour over average roads. If we glance at the lists of most manufacturers, whether English or foreign, we find that this type of car is a prominent feature.

Thirdly, there is the high-powered class of car designed essentially for touring. It is a four or five-seated car propelled by a four-cylinder engine of about 12-h.p., and it has these very desirable points:—It is capable of a good speed on the level, say thirty-five miles per hour, and it is speedy uphill—that is, it will surmount the average hill at about sixteen miles per hour, thus enabling a very good average to be maintained during the day's journey. The price of this car will be found to be between £500 and £600, and, although not within the reach of everyone, it is unquestionably the modern touring car. Users of the type of car in the second class mentioned above will, after a year or two's use of the same, dispose of it, and purchase the four-cylinder type. If legislation is going to limit us to twenty miles per hour, it is certainly useless to own a higher-powered car than the last mentioned. After all is said and done, for a good touring car one surely cannot wish for more than an average speed of about twenty-eight miles per hour, and absolute comfort.

R. A. C.

No less than 23 motor-cars will be engaged in the forthcoming manoeuvres of the 4th and 12th Army Corps in Saxony.

THE American Motor League estimates that the number of automobiles in use in the United States amounts to about 51,000, and is increasing at the rate of about 1,200 to 1,500 per month.

Of the American team who competed in the Gordon Bennett race, the first to reach home is Mr. I. P. Mooers, of Cleveland, who, on landing in New York, fell into the hands of the inevitable interviewer. Asked as to his opinion of the Cup race, Mooers replied:—"We were outclassed, and that's all there is to say." The driver of the "Peerless" recounted briefly the troubles that put him out of the race, the first of which was due to a tyre pulling off about forty miles from the starting point, while a similar accident near the end of the first circuit led him to withdraw. He complained very much of his tyres, but admits that he gained much information which will be of great use to him in the design of the racer he intends building for the 1904 contest.

CONTINENTAL NOTES.

By "AUTOMAN."

ALTHOUGH Paris is emptied of its fashionable residents and visitors, who are taking their summer holidays at the seaside, or in the mountains, or in automobile tours through the length and breadth of Europe, there still remain the devotees to aeronautics, who are making the most of the summer time to complete trials of their inventions at the time of the year when the atmosphere ought to be in the most tranquil and favourable condition. I say advisedly "ought to be," for, as a matter of fact, the weather in and around Paris lately can be summed up by a succession of storms. Amongst the above mentioned devotees comes, first and foremost, the little Brazilian, Santos Dumont, whom I happened to meet dining out on the Bois de Boulogne the other night. M. Santos Dumont is hard at work on his aerial omnibus, with which he hopes to carry a large party shortly to Trouville. From time to time he takes short flights about Paris on his smaller air-ship. Amongst the experiments he made with this latter was

the Engineers, M. Hirschauer, to examine with you the measures to be taken to carry out your proposition. Lieutenant Colonel Bourdeaux, one of the heads of my department, will also assist, so that I may be personally informed of the results of your collaboration."

M. SANTOS DUMONT proposes to make the following practical experiment. His little balloon will be packed up and put in the train in Paris, with tubes of compressed hydrogen for inflating it. The War Office will choose a fortified town on which to make the trial, and the train will carry the balloon and the staff of workmen within a short distance of the chosen town. The balloon will then be unpacked, inflated, and Mr. Dumont will endeavour to fly over the town.

THE Paris municipal authorities have ordered a 30-h.p. automobile street watering cart, capable of travelling from ten to twelve miles per hour with a load of over one hundred gallons of water. In winter time it can be transformed into a cart to carry the snow away or to transport any other material. The first trials

Mr. O. E. Bush on a 12-h.p. Gladiator outside "Groote Schuur," the South African Residence of the late Hon. Cecil Rhodes. The gentlemen in the tonneau are Dr. Jameson and Mr. Abe Bailey, M.L.A.

a demonstration at the review which took place on the French National fete day, the 14th of July, on the Longchamps race course in the Bois de Boulogne.

A FEW days after the review M. Dumont wrote to General André, the Minister of War, a letter in which he offered to put his balloons at the entire disposition of France in case of a war with any country except his own, "Brazil." In reply M. Dumont received the following letter from General André:—"Sir,—During the 14th of July review I remarked and admired the ease and certainty with which you steered your balloon. It was impossible not to recognise the progress that the problem of aerial navigation owes to you. It seems that, thanks to you, it is now of practical use, especially from a military point of view. I judge that it can render great service in time of war. I therefore accept with thanks the offer which you make to place your aerial fleet at the disposition of the French republic in time of war. I thank you for your generous proposal, which gives witness to your real sympathy with France. I have chosen the head of the aerostatic battalion of the 1st regiment of

of this useful vehicle will take place in the Bois de Boulogne on the 20th inst.

A STRIKING instance of the absurdity of the numbering system has just come to light in France. M. Ernest Archdeacon was charged on July 30th for having upset a cab on the Champagne road on the 9th of September, 1902, and with having seriously wounded three persons and taken flight. The reason of the delay in making the charge is easily to be understood when it is known that one witness said the number of the motor-car was 706F, whilst another said it was 706S, and a third affirmed that it was 706E, which happens to be M. Archdeacon's number. The magistrates have been trying them all in turn. Fortunately for M. Archdeacon he can prove that he was in Switzerland at the time, and that his car was in the repairers' hands at the time.

THE Laffrey hill climbing trial took place last Sunday for the third time under most favourable conditions. The weather was bright and sunny, and the surface of the roads in good condition. A great crowd assembled to see the race, including

many well-known Parisian enthusiasts. The laurels of the meeting fell to Gobron-Brillie, for not only did two of these cars head the heavy car class and also the general classification, for the hill climbing contest, but the de Caters cup for the kilometre with a standing start fell to a Gobron-Brillie driven by Rigolly in 50 1-5 seconds, beating Serpollet's record last year by just 9 seconds, and also beating a Paris-Madrid Mors car by 7 3-5 seconds.

RIGOLLY climbed the hill in 5 min. 33 sec. at a speed of nearly forty-four miles per hour, and Duray on a sister car was 35 3-5 seconds after him. In the light car class Beconnais on a Darracq headed the list in 6 min. 12 3-5 secs., and another Darracq driven by Osmont took the second place. Two Darracq voitures carried off first and second places in their class, and the first of the two, driven by Wagner, took the fourth place in the general classification. The third, fourth, fifth and sixth places in the general classification fell to Darracqs. In the motor-cycle section, Dorny, on a Clement, was first in 7 min. 58 sec. from a standing start. In the tourist class a 60-h.p. Mercedes was the winner, driven by the Count de Rougemont.

ON Monday a novel competition was decided at Uriage in connection with the Laffrey meeting, viz., a series of trials over

events, namely, one for the heavy class, 100 kilometres, and one for the light class, 40 kilometres.

ON September 13th there will be held at Schottwein-Semmering the annual Austrian hill climbing trial organised by the Austrian Automobile Club, and generally known as the "Semmering Hill Climbing Trial." There will be the usual four classes, namely, heavy cars, light cars, voitures, and motor-cycles.

IN automobile circles the question of next year's racing programme is being actively discussed, and widely differing opinions as to the most interesting course to be followed by the chief organisers are held by various sections. One thing is certain; racing there will be, and probably the chief event of the year 1904 will be the eliminatory trials for the choice of the Gordon Bennett cars, for an arbitrary choice such as has hitherto been made by the racing committee of the A.C.F. will no longer be tolerated. One idea is to have a great eliminatory race, in which each manufacturer will be permitted to enter three representative cars, the three cars which win the race to compete for the Cup.

A MONUMENT in memory of the late Marcel Renault is

An Ader Car in use in connection with the French Military Manœuvres.

[Le Chauffeur.

a 500-metre course, the competitors to make a standing start and a stopping finish—that is to say, the cars had to be brought to a stand on the finishing line. Le Blon, on a Serpollet, and Rougier, on a De Dietrich (Turcat-Mery), shared the honours of the day, both tying for the first place in the general classification and the heavy car class, the time being 39 sec.

A PROPOSITION is on foot to institute a race from Paris to Trouville, down the river Seine, for motor-boats; there are, however, many difficulties, and not the least of them will consist in the question of pilots, for there are parts of the river where sand-banks abound where the channels are continually shifting, and where only an expert pilot can find the way and avoid running aground. These spots are already marked by many wrecks. It remains to be seen, however, whether motor boats with small draft and great ease of manipulation will be better able to negotiate these shallows. The race is, however, to take place on September 6th, and there are already twelve entries.

A WEEK later the "Auto" will hold a motor boat race on the upper reaches of the Seine, above Paris. There will be two

shortly to be erected in Billancourt, on a site granted by the local authorities, near the Renault works.

TROUBLE is brewing for motorists in Vienna. In a circular to the municipal authorities, signed by a number of citizens, and calling for restrictive regulations, the motor-car is described as "an infernal vehicle," which runs about snorting, rattling, clattering, and the occupants of which are rendered unrecognisable by their ridiculous clothing. The chauffeurs drive recklessly, without any consideration for the foot passengers, and it is therefore proposed that automobiles should be silent and odorless, and should be numbered. They should also on all occasions be driven slowly, and women should be strictly forbidden to drive."

THE 5-kilometre per hour regulation in the crowded parts of Brussels is likely to continue in force for some time. The Lord Mayor is at present away holidaying, and in answer to a deputation of the Chambre Syndicale de l'Automobile, on the subject, the deputy-mayor said that nothing could be done in the matter until October.

MOTOR-CYCLING NEWS.

THE 1,000-miles reliability trials for motor-cycles organised by the Auto-Cycle Club were started by a run to Canterbury and back on Tuesday, the weather being anything but favourable. Forty-eight machines have been entered, including most of the best-known makes, but it is to be regretted that in consequence of the objection to certain points in the marking, a few of the leading manufacturers are not taking part. However, among the entries are the Ormonde, Bat, Kerry, Peugeot, J.A.P., Noble, Booth, Roc, Griffon, Ariel, Brown, King, Lagonda, Castell, Jehu, Chase, Matchless, Regina, Evart-Hall, Alldays, Werner, Phoenix, F.N., Weller, Bradbury, and R. and P. The trials will comprise nine journeys in all, making up a total of 1,034½ miles. A minimum average speed of twelve miles an hour must be maintained, but the routes are divided into sections of ten miles, and a minimum and maximum time is fixed for each portion. A rider will render himself liable to disqualification if he arrives at a stopping-place ahead of time more than once on any day or more than four times in the course of the trials. Marks will be awarded for a speed test on the track at the Crystal Palace, accessibility, petrol capacity, style and finish, efficiency of brakes, and other points which enter into the requirements of a motor-bicycle. Hill-climbing tests will be held on two severe ascents, but no marks will be awarded, a record being simply made of the performances, and of the amount of pedalling, if any, which was required. Marks will, however, be deducted for failure to ascend a third slope of average gradient.

THE Rex Motor Manufacturing Co. write us as follows:—"You will doubtless have been surprised to notice that, although we are one of the firms which protested against the rules governing the 1,000-miles motor-cycle trials, a Rex motor-bicycle is nevertheless entered in the trade section. In case this entry may put the trade under the impression that we have not acted fairly in this matter, we shall take it as a favour if you will allow us to state that Mr. H. W. Stones' entry was entirely private, and that we had no knowledge of it until we saw it in print. We immediately took this matter up with Mr. Stones, and when he became aware of the reasons why we, in conjunction with other firms, had refrained from competing in these trials, he immediately decided not to start."

At the Canning Town track on Friday, last week, T. H. Tessier on his Bat motor-bicycle beat world's motor-cycle records from six miles to 15 miles inclusive. His time for the full distance was 16 min. 47.3-5 sec. Tessier also lowered the five miles flying start world's record to 5 min. 3.1-5 sec.

As mentioned last week, the annual race meeting will be held on the Crystal Palace track on Saturday, the 22nd inst., when three events are to be decided: 1, one hour invitation scratch race; 2, a five miles handicap; and 3, one mile time trials (flying start). The entry list closes to-day (Saturday). In the official notice of the meeting sent us by the Auto-Cycle Club, we observe that the name of Mr. D. Citroen is given as the holder of the *Motor-Car Journal* Challenge Cup, in place of that of Mr. S. C. Holloway, who won it last year.

THE Circuit de l'Herault, for motor-cycles, which was to have been held on the 10th inst., did not take place owing to the Prefet declining to give the necessary permission.

At the Celtic Football Club's sports at Celtic Park, Glasgow, on Saturday last, H. Martin, on his Excelsior, beat the five miles motor-cycling record, doing 5 min. 53.3-5 sec., or 29.3-5 sec. faster than the former fastest from a standing start.

A LIEUTENANT in the Russian Army, Nicolas Griboiloff, is at present engaged on a ride from St. Petersburg to Paris on a

4½-h.p. Peugeot quadricycle. The lieutenant, accompanied by his wife, passed through Berlin a few days ago.

EFFORTS are being made to form a motor-cycling club for Manchester and district.

By the use of a motor-cycle a rural postman in Pennsylvania is covering his route in one-third the time it required with a horse and cart.

THIS week we give illustrations of a new driving pulley for motor-bicycles which has been introduced by Mr. F. Brittain, of Twickenham. It is known as the Duplex Pulley, and has been designed to reduce the liability of driving belts to stretch and slip. The drum of the pulley is made cone shape and of sufficient width to allow the round belt to be wound round one complete turn in addition to the amount that would run on an ordinary pulley; this additional winding tightens up at each impulse of the motor and thus gives, it is claimed, the elasticity required to take off the sudden shock at each impulse of the motor. The cone shape of the pulley gives the belt a transverse movement across the pulley as it turns around, equal to the thickness of the belt, each revolution of the pulley. At A the belt is shown running on the pulley, and at B running off. Mr. Brittain informs us that he has ridden his 2-b.h.p. motor-bicycle, with a

Duplex Pulley and a ¾-in. twisted hide belt, several hundred miles many times doing a journey of thirty miles on the road under 1½ hours without dismounting from the machine, the stretch on the belt not being sufficient to need tightening. Mr. Brittain claims for his pulley that the impulse of the motor is automatically eliminated and thus the life of the belt and hook is lengthened many times. The belt is also prevented from slipping by reason of the locking action, which increases as the power of the motor increases. The favourite round hide belt is most suitable for the new pulley, a ½ inch one being ample for 2½-h.p. motors. Oil on the belt is said to rather improve the running than otherwise, there being a reserve of grip with the pulley bright and the belt well oiled.

THE "Auto" is organising a race for motor-cycles based on a limit of quarter of a litre as the cubical contents of the cylinder. The meeting will take place in Paris between the 14th and 20th of September, and the course will be 100 kilometres. The weight of the rider and his saddle must be 75 kilos. at least, that is to say, 1 cwt. 1 qr. 25 lbs. No pedalling will be allowed.

SOME USEFUL NOTES.

A CONSIDERABLE portion of the prejudice which still exists against the petrol car arises from the necessity of having to start the engine by hand. Many automobile motors are, of course, arranged to be started from the seat, and some of the four-cylinder engines which use high-tension ignition are practically self-starting after short stops by the simple operation of moving the spark timer to the position where the sparking circuit of the proper cylinder is closed. The majority of engines, however, must be turned by hand after the preliminary operations are completed.

It is an advantage to have the handle permanently attached to the engine shaft through a ratchet mechanism, as the trouble of attaching it and removing it and of storing it away in the vehicle is thus avoided. The danger of its being lost is also obviated. The necessity of flooding the carburettor in order to secure the first explosion is, remarks Mr. A. L. Clough in the "Horseless Age," one of the steps of the starting process which ought to be done away with, if possible. If it cannot be dispensed with it should be so conveniently arranged as to be the work of an instant, not to necessitate the laying back of any part of the machine or to require stooping under the vehicle or

Mr. L. P. Mooers on his Gordon Bennett "Peerless" Racer.

soiling the hands. In order to prime the carburettor of some machines the bonnet must be lifted before the operation can be performed. The turning on of the lubricating oil is a necessary part of the starting operation unless splash lubrication, a mechanical force-feed system, or cups actuated by the pressure of the exhaust are employed. If a magazine lubricator is used the trouble of turning on the supply is minimized, but where there are several independent cups the operation of starting is correspondingly complicated. Mechanical lubricators are certainly very convenient in this respect.

AN attempt to start the engine with an early spark is likely to result in a sprained wrist, if nothing worse, especially if the cylinder be large. There is nothing more "jarring" to the system than to have a large engine "kick back" when the whole strength of the *chauffeur* is acting in the opposite direction, and the provision of means to automatically set the spark late in the stroke, before starting can be attempted, is a valuable point in any motor-car. An interlocking device connected with the spark timer and acting to prevent the attachment of the crank, unless the spark be in the late position, forms a useful feature of one well-known vehicle. In some cars the spark is normally set at a position sufficiently late for safety in starting, and is advanced by means of a pedal acting against a spring which serves the purpose

of an "accelerator" in speeding up the engine only so long as it is pressed down. The provision of relief cocks conduces to ease in starting, but their use is by no means general except upon single cylinder engines, which, if of any considerable size, should pass compression only with great difficulty.

A PERSON who has just acquired a motor-car is almost sure to make "bad breaks" when attempting to start his engine unless he is very cool and methodical by nature. Too often one sees an owner step jauntily up to his car at the kerb for the purpose of making an exhibition for the benefit of the assembled throng. After making a few passes at the car he gives the crank a smart twist, but the expected does not happen, even after several breathless attempts. He generally finds that the interruptor plug is in his pocket, or that he has not turned on the petrol, when he comes to the thinking stage of the performance. All this bungling hurts the reputation of the automobile as a practical conveyance.

THERE should be a regular routine of operations when starting, and one should be deliberate in performing them. For instance:—The oil may first be turned on and the relief cock opened, if one be provided. The petrol may be turned on and the carburettor may then be primed. A glance should be taken at the spark timer to make sure that it is in its late position; the engine turned, if a single cylinder affair, until it is just over compression; the switch put on and the handle given a sharp turn, when the motor will start as it passes the next spark point. A certain order of precedence, if adhered to, becomes habitual and there is no likelihood of any failure.

If a motor fails to start with its accustomed promptitude, it is folly to twist the handle exhaustively. There is a reason for the failure, which requires for its correction mental rather than physical energy. Of course, the trouble is due rather to a failure of the spark, a lack of charge, or a loss of compression. Perhaps the inlet valve has stuck and fails to operate, allowing no gas to be sucked into the cylinder. If the valve be accessible a touch will determine whether it be free or not. Sometimes in motors having an inaccessible inlet valve, a little stem is provided to allow one to test the valve's condition.

THE auxiliary spark gap, while it may not be a cure-all for ignition difficulties, does furnish ocular evidence as to whether the spark is passing or not, and assists in locating this class of troubles. Sometimes when one has had occasion to leave the machine on a down grade, it may be started without turning the handle, for as soon as the brake is released the car will move by gravity, and after it has acquired some momentum the spark may be switched on and the engine put in operation in this way.

ONE point to be remembered above all others in starting the motor is that a few quick turns of the crank will do more to start the engine than five minutes of slow turning.

FOR motor-cooling purposes always use soft water whenever possible; hard water gradually forms a deposit on the inside of the tubes, which is especially objectionable because of the fact that it soon reduces the efficiency of the radiator. In filling the tank always use a large filtering funnel—a funnel having a piece of wire gauze of fine mesh soldered inside. When the vehicle is new, and after filling the water tank for the first time, go over the circulating system very carefully to ascertain if there are any leaks; if so, repair them permanently before starting out. A temporary repair on the road is sometimes a necessity, but to avoid future trouble always make permanent repairs whenever possible. The smallest leak may develop at any time into a serious difficulty—especially if repairing facilities are far away.

THE Automobile Club of Florence is organising a race from Florence to Viareggio.

HERE AND THERE.

THE King of Portugal has acquired a C.G.V. car.

Two new motor 'buses are to be put on the road at Hastings.

A MOTOR-CAR is to be provided for the use of the Notts County Surveyor.

THE Lincolnshire Automobile Club will hold a run to Skegness to-day (Saturday).

A LONDON company is supplying men to clean the motor-cars of private owners.

ON the last Friday and Saturday in September motor speed trials will be held on the promenade, Southport.

LORD BOSTON has lately joined the ranks of automobilists, his choice having fallen on a 12-h.p. "Magnet" car.

A MOTION in favour of the speed limit being defined, proposed at a meeting of the East Sussex County Council, has been defeated.

THE third exhibition organised by the Belgian Chambre Syndicale de l'Automobile is to be held in Brussels from the 23rd January to 4th February next.

THE Birmingham Motor Express Company has been registered with a capital of £5,000 to carry on the business of motor-car manufacturers, etc.

MOTOR LIVERY, LIMITED, registered with a capital of £500 is the title of a company to carry on the business of manufacturers, repairers, and letters of motor-vehicles, etc.

MR. J. WILSON'S protest against the timing of his car in Class D of the Phoenix Park trials has been upheld. The time was 2 mins. 14½ secs., not 3 mins. 14½ secs., as originally given.

MESSRS. BROOKE AND CO. have established a garage with an inspection pit in Parliament Street, Ramsey, Isle of Man, a few minutes from the landing stage of the Isle of Man steamers.

THE motor 'bus which was hired by the Wolverhampton Corporation has been tested by the mayor and other members of the corporation, and it has started running on the Dudley road route.

AS Captain Low, of Kilshane House, Tipperary, was motor-ing to the Clonmel Horse Show the other day, a tyre punctured, his car was overturned, and he received considerable injuries.

RECENTLY we mentioned the new garage established by Mr. James Fryer at Kington (Herefordshire) on the main road from

London to Aberystwyth. In the accompanying photograph Mr. Fryer, who is an agent for cars as well as a repairer of the same, can be seen at the helm of the Oldsmobile.

AN explosion of petrol in the shop of a cycle agent, Mr. Paley, Morpeth, has destroyed the premises and severely injured the proprietor, an apprentice, and a customer who was in the place at the time.

THE Lancashire Steam Motor Company have just received an order for eight of their Colonial 4-ton tip wagons for Cape Town. It is interesting to learn that the builders have guaranteed delivery of the eight vehicles at the rate of one per week.

THE Automobile Club of New Jersey has voted a sum of money to cover the expense of placing signboards at intervals along the road between Highland Park and Perth Amboy, N.J., for the guidance of automobilists driving from New York or Newark to the coast resorts.

THE staff and employees of the firm of Alfred Dunhill, Limited, have been entertained at dinner on the occasion of the opening of new premises for the manufacture of motor clothing, etc., at Tottenham, N. Over eighty sat down, and Mr. Dunhill, in responding to the toast of the firm, dwelt on the growth of the "Motorities" section of the business, which was materially assisted by the harmonious relationship existing throughout the firm.

MANY motorists drive up too close to the kerb stones, and in doing so the friction on the sides of the cover naturally causes it to wear out on the sides, so that sooner or later the canvas layers are exposed. Although, remark the Continental Tyre Co. in their handbook, this does not make the cover unfit for use at once, it is advisable to send it to the maker for repair immediately. In most cases it is sufficient to replace the rubber which has been rubbed off, and this can be done comparatively cheaply, but in some cases a new rubber tread may be required. This, of course, depends entirely upon the extent of the damage. If, however, the exposed canvas layers become partially or completely destroyed by continued driving against kerb stones, it may become quite impossible to repair the tyres in question. It is therefore advisable to carefully avoid driving against kerb stones.

Dr. H. Nelson Jackson at the wheel of the Winton Car on which he has just made the journey from San Francisco to New York.

MESSRS. JULIUS HARVEY AND CO. have secured an order for a steam motor vehicle with canopy, to be used for carrying hunting parties to the meet. After the hunting season this car, in the form of a light motor-wagon, will be used for general agricultural or farm purposes.

DEPICTED in the accompanying illustration is the 'motor-chemical engine which forms part of the equipment of the Liverpool Fire Brigade, with Capt. Thomas, the chief superintendent, seated at the side of the driver. The engine is mounted on an 18-h.p. Daimler chassis; the road wheels have recently been

fitted with 3 in. high-speed Royal Buffer tyres by the Sirdar Rubber Co., which enables the vehicle, notwithstanding its weight, to attain speeds up to 25 miles per hour, and consequently to reach the scene of a fire in a minimum of time.

THE Automobile Club of America has just published, for the use of its members, a handy pocket volume containing a copy of the full text of the automobile law in each of the following states:—New York, New Jersey, Pennsylvania, Connecticut, Massachusetts, Rhode Island, Vermont, Maine, and Delaware.

THE Holcar Company, Limited, has been registered with a capital of £30,000, to adopt an agreement with Mr. W. K. L. Dickson and the United Kingdom Inventions Association, Limited, to construct and deal in oil and other motors, locomotives, and vehicles, and to carry on the business of engineers, etc.

IT having been freely stated that the successful Mercedes car in the Gordon Bennett Race was fitted with 5 in. tyres, the Continental Caoutchouc Co. write to the effect that the tyres fitted to Jenatzy's car were not 5 in. throughout, but that the front wheels were fitted with 90 mm. or 3½ in. tyres, and the back wheels with 120 mm. or 5 in. tyres. The 3½ in. tyres used on the three competing Mercedes cars stood as well as the 5 in. tyres.

ONE of the new clauses added to the Motor-Car Bill on Tuesday is as follows:—"The Local Government Board may, by regulations made under Section 6 of the principal Act, prohibit or restrict the driving of any motor-cars, or of any special kind of motor-cars, on any specified highway, or part of a highway, which does not exceed 16ft. in width, or on which ordinary motor-car traffic would, in their opinion, be especially dangerous."

THE Rev. F. T. Wethered, a Berkshire vicar, regrets the poverty of the English language. In fact, according to him, "there is no language of any sort half strong enough to express

my detestation of these damnable engines of Satan." The reference is to motor-cars, and the clergyman who is anxious to find adequate expression for his thoughts has made a vigorous start on the road to success. A trip to Billingsgate might assist him.

ON another page we publish some interesting remarks on touring by motor-car culled from an article on the subject by Mr. Robert Bruce in the columns of the "Automobile Magazine."

THE Home Secretary has given notice that he has certified the manufacture of electric accumulators to be "dangerous," under the Factory Acts, and that he proposes to make regulations to apply to all factories and workshops in which electric accumulators are manufactured.

FROM Messrs. W. Butcher and Sons comes a new Primus handbook, "Photography with Roll Films," by Mr. John McIntosh. Having regard to the number of motorists who carry cameras, particularly of the daylight loading kind, this volume of nearly 200 pages gives practically everything that the amateur photographer wishes to know.

THE Albany Manufacturing Company, Ltd., of Willesden Junction, N.W., have recently introduced the automatic injector sight-feed lubricator illustrated herewith. It is specially designed for use on steam motor-cars, and is made of gun metal throughout. The reservoir is detachable from the upper part for replenishing the oil supply. It can thus be filled away from the

car, and the superfluous oil wiped off before replacing, thus preventing the oil being spilled about the vehicle. The best place for the lubricator is in front of the driver, preferably on the splash-board of the car, so that the oil-feed is always in sight; and it can be adjusted to deliver from twelve drops of oil in one minute to one drop of oil in twelve minutes to the engine cylinders, and valves.

THE FRANKLIN PETROL CAR.

ALTHOUGH, so far as this country is concerned, considerable scepticism is shown with regard to the use of air-cooled engines in other than motor-cycles, there are several American manufacturers who claim to be using them on cars with success. The accompanying illustration shows the neat two-seated car, the production of the H. H. Franklin Manufacturing Company, of Syracuse, the feature of which is that the motive power is supplied by a 10-h.p. four-cylinder air-cooled engine. The frame is made of angle iron stayed by cross supports from the same material. To this frame is attached the engine and transmission, the petrol tank, oil pump and ignition dynamo. Four full elliptic springs, thirty-four inches long, are attached to the frame and rest directly on the axles. The motor, which comprises four air-cooled cylinders of the vertical type, is located in the fore part of the frame under a bonnet. The bore and stroke is $3\frac{1}{4}$ inches, while the speed can be varied from 300 to 1,200 revolutions per minute. The valves are integral with their seats, springs, etc., and are easily removed. One oil reservoir with automatic pump supplies oil to the crank case, the lubrication being on the splash system.

The current for the ignition is generated by an Apple dynamo, the auxiliary and starting current being furnished by a small accumulator constantly charged by the dynamo. The sparking plugs are of special design, giving unusually long insulation on the sparking end and preventing short circuiting by carbon deposits. Only one coil is used for the four cylinders. Two forward speeds, controlled by a lever at the side, and a pedal-operated reverse are provided, the gears being always in mesh, the power being transmitted through the desired pair by means of clutches. The gear box is attached to the engine base on the driving shaft.

The running is almost all done on the high gear, on which, by means of the throttle and spark control, any speed from five to thirty miles an hour can be obtained. On the high gear the power is transmitted direct through a single centrally-located chain to the rear live axle. Wheel steering is provided, while a double-acting band brake is attached to the differential on the rear axle. In addition the reverse clutch operates as a brake on the transmission. Both are operated by

pedals. The low speed clutch will, it is stated, also hold the car on any grade, as the weight of the vehicle is not enough to drive it with the low clutch in if the engine is disconnected. The car has a wheel base of 6 ft. and is mounted on 28 in. artillery wheels shod with 3 in. pneumatic tyres. The weight, with petrol tank filled with seven gallons of petrol, comes out at about 10 cwt.

RECORD BREAKING IN AMERICA.

AN interesting afternoon's racing was held on the Empire State track, near New York, on the 25th ult., when a number of new records were established. About 6,000 spectators were present, a large proportion of whom had journeyed to the track by motor-car, there being over 300 automobiles in the enclosure. The first event was a five-mile race open to cars weighing less than 1,200 lbs., in which five competed. The winner was J. Wilkinson on a 10-h.p. four cylinder air-cooled Franklin, who covered the distance in 6 min. 54 secs. Following this came a successful attempt at the mile track record by Barney Oldfield on his Ford-Cooper 80-h.p. racer, with bar steering, who reduced his own figures from 56.2-5 secs. to 54.4-5 secs. A

Barney Oldfield on his Record-Breaking Car.

[Motor Age.]

ten-mile race only brought out two competitors, J. Wilkinson on a 10-h.p. Franklin beating J. Tracy on a 10-h.p. Renault, time 15 min. 15.1-5 sec., claimed to be a record for the distance. The next event was an exciting one, being a fifteen-mile match between three racing cars—the Gordon Bennett 80-h.p. Peerless, driven by C. G. Wridgway, a Paris-Madrid 40-h.p. Decauville, driven by Henri Page, and L. Grosso on a 60-h.p. Mercedes. The latter proved to be the winner in 16 min. 10.4-5 sec., the Decauville being second and the Peerless third. A ten mile race for cars under 1,800 lbs. brought out four starters and was won by J. Sincholle on a 40-h.p. Darracq in 10 min. 52.4-5 sec., Page on the 40-h.p. Decauville being second. A five-mile match, best two out of three heats, was next decided between Barney Oldfield on his Ford-Cooper racer and F. A. La Roche. The latter had to use a 35-h.p. Darracq instead of a 70-h.p. car of that make he had intended to drive, so that Oldfield's victory was not unexpected. The best five miles was done in 5 min. 9.4-5 sec. A fifteen-mile open race brought out the Peerless racer, a 40-h.p., and a 35-h.p. Darracq, a 40-h.p. Decauville, and a 70-h.p. Panhard. This event proved a victory for Page on the Decauville, his time being 16 min. 39.2-5 sec. The afternoon's racing was concluded by a series of mile time trials, the best performance being that of Grosso on Mr. O. W. Bright's 60-h.p. Mercedes, 1 min. 3.1-5 sec. The afternoon's racing resulted, according to "The Automobile," in the breaking of the world's track record for one mile by Oldfield; all world's track records from one to ten miles for petrol cars weighing less than 1,200 lbs. were broken by the Franklin, while Grosso, on the 60-h.p. Mercedes, broke Bostwick's records for eleven, twelve, and thirteen miles made at the Empire City track in October, 1901, and Henri Fournier's records for fourteen and fifteen miles made at Fort Erie, Can., in September of the same year, for cars weighing more than 2,000 lbs.

CORRESPONDENCE.

QUERIES RE ACCUMULATOR CHARGING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a 15-h.p. Panhard, with two 40-A.H. accumulators. I have also an electric light plant with fifty "E. P. S." accumulators for lighting the house. Can I charge the cells for my car from the lighting cells without a resistance? The lighting accumulators have seven positive plates each, and measure 16 in. by 12 in. What I mean is: If I disconnect two of these large cells which give 2.5 volts each, can I connect them up to the little car cells without any resistance, or will the current be too great? Must I reduce the amperage by some means, or will the small

cells just take enough and no more? I enclose sketch of the method of charging I mean,—Yours truly,

NEILAGE CURRIE.

MOTOR-CAR LEGISLATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Might I, as a member of the Bar and one who has driven motor cars since 1898 at least 60,000 miles, suggest the following way of dealing with the question of speed? It seems to me perfectly simple: (1) No speed limit; (2) every driver or owner who drives to have a licence (the fee to be paid for such licence is immaterial, but might reasonably be much lighter in the case of an owner than in that of a paid driver); (3) any one convicted of driving to the danger of the public to be liable to a fine and suspension of licence (i.e., absolutely prohibited from driving any car) for, say, twelve months, under penalty of imprisonment.

This I think should settle the whole difficulty—the paid driver will have his livelihood taken away, and the amateur or owner his pleasure. The new law as framed will give power to prejudiced magistrates to inflict imprisonment without the option of the fine, and I fear that a few benches will not be slow to take advantage of it.—Yours truly,

W. PLAYER BRIGSTOCKE.

THE HORSE-POWER OF PETROL MOTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to the article which appeared in your issue of 25th ult. as to the horse-power of petrol motors, we are afraid it will be difficult to arrive at any satisfactory means of standardisation for the reasons we give below, and we think that probably the best plan would be for the buyers to insist upon being told the diameter and stroke of the engine, and the speed at which the stated horse-power is developed. We think that the brake horse-power given in the description of the car ought to be the brake horse-power which the motor will comfortably develop at the stated speed continuously for at least half an hour at a stretch; not more and not less.

As to the average of column nine, we would point out that, whereas the 173 litres per horse-power per minute would be ample in an engine running at a moderate speed, the probability is that it would be too small at a higher speed. For instance, in an engine running at about 700 revolutions per minute, a brake horse-power could be got comfortably for each 150 litres piston displacement per minute, especially if the engine were fitted with mechanically-operated inlet valves of ample area. At a speed of 1,800 revolutions, however, we would certainly be inclined to allow not less than 200 litres.

The question of compression has, of course, a great deal to do with it. The higher the compression the greater the output for the same piston displacement; but, on the other hand, the higher the compression the more violent is the explosion, and consequently the greater the vibration transmitted to the car. This consideration therefore limits the increase of b.h.p. to be got by modification in that direction.—Yours truly,

ALBION MOTOR-CAR CO., LTD.
F. B. MURRAY, B.Sc., M.I.E.E., Managing Director.

THE MIDLAND HILL CLIMB

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice that on page 452 of your last issue you give the official results of the Midland Hill Climb, but I regret to observe that they give the incorrect time, score, and position in the handicap for the 18-h.p. James and Browne car which I drove in the contest. The previous week you gave the correct gross time of the car as 3 min. 57.3-5 sec., from which it will be seen that the net time, after deducting one

minute for the two official stops, is 177.3-5 sec., and not 277.3-5 sec., as published, and from which the results have been deduced.—Yours truly,
T. B. BROWNE.

HORSE DRIVERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I would like to ask your readers if there is any law against what is now becoming a prevalent practice amongst horse drivers, viz., holding up their hand, signalling motor-drivers to stop the car when they have horses that do not even look at the car and trot by as quietly as if the motor was not near them.

I was driving a friend of mine to Maybole from Ayr (he is a horse driver) the other day, when we met a horse and trap coming in the opposite direction. The driver at once held his hand up. When he was passing, my friend asked him why he stopped the motor, and he replied, "restive horse." My friend told him it was not a restive horse, as he had himself driven the same animal for three years.

Horse drivers of this class cause a great many motor drivers to rush madly on, paying no heed to signals, simply because they think it is mere horse bluff on the part of the driver of the horse. We would have more careful motor drivers if we had more (in most cases) respectful horse drivers. Another point I would like to be made clear in, when a driver overtakes a horse vehicle and the horse driver holds up his hand, is the motor driver compelled to keep behind, or is he supposed to pass him (as long as it is not a restive horse or horses)? Hoping some reader will make these points clear.—Yours truly,

MOTOR DRIVER.

MOTOR-CAR RACING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We have no desire to prolong this discussion on the lines it is now taking, as it does not bring us any nearer the point we want to get at. We do not suppose we shall alter Mr. Nixon's views by anything we can say, and up to the present he has not convinced us, so this will be our last communication on the subject.

Mr. Nixon asks for proof that Benz and Peugeot adopted vertical engines because they were fashionable. We can only say that, knowing the opinions held by the firms named on the horizontal engine, we assert it is so. We may, of course, be wrong, but we think not; and Mr. Nixon on his part produces no proof to the contrary. We do not take the statements of Consuls-General as proof upon all points. Just think what £4,320,000 means, and how many cars it represents. We are just hearing similar stories about the Gordon Bennett and Germany. In fact, £3,000,000 statements were flying about the day after the race. The Mercedes people will undoubtedly benefit by the win, but they are the only firm in Germany that will, to any appreciable extent, and they could not turn out the value named in three years. It means nearly 4,000 £1,000 (retail) cars, which, in the words of Euclid, "is absurd." We think we know as much of the motor trade as Mr. Nixon, and we say that, in the light of that knowledge and of common sense, such statements are absurd, whether they be made by Consuls-General or by newspapers, from which the Consuls-General obtain them.

Mr. Nixon said that it was to racing that we owe the silent car, and now he says he never said that in a race any car was silent, which is right. If he had said that the people who make racing cars have also shown they can make quiet ones, he would be right, but racing has had no effect upon it. Mr. Nixon says Jenatzy's Mercedes was very noisy, "but get the car ready for touring and see the difference." In this he proves our case. If racing has done anything at all, it has made cars more noisy.

We do not say that because the Mercedes firm have adopted throttle control they have copied our cars, but we do say they have adopted a system which we had been using five or six years, and that in doing so they made their cars quiet; and we do say that, because the firm named and other makers of racing cars did not adopt it earlier, the public, who could not believe that petrol cars could be made quiet, as the "best"—i.e., the fastest—cars in Europe were noisy, were deprived for many years of the luxury of (comparative) quietness which they now enjoy, and which would have been "discovered" and appreciated earlier but for the undue prominence given to speed and the makers of it.—Yours truly,

THE DURYEA MOTOR CARRIAGE CO.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The discussion between the Duryea Company and Mr. Nixon is unprofitable. A prospective purchaser who prefers the vertical motor has an almost unlimited selection; but how about the unfortunate individual who prefers a horizontal motor, or a different design of car? He is limited to some three or four patterns. Do not endeavour to deprive him of this limited choice, mistaken though he may be.—Yours truly,

J. W. W. B.

[This discussion is now closed.—ED. M.C.J.]

"FABER" writes:—I should be greatly obliged to any of your readers who have had experience of the Miesse steam car, of which I have heard curiously contradictory reports, if they would give me their opinion of it.

CLUB NEWS.

NORFOLK.

AT the invitation of Lord Hastings, the Norfolk Automobile Club had a most successful meet at Melton Constable Park last week. His lordship had made every arrangement to ensure the enjoyment of his guests, and, the weather being fine, a very agreeable time was spent. There was a large gathering of motorists and their friends, the cars and their owners including the following:—Lord Hastings, 16-h.p. Brooke; Messrs. P. Norgate, 4½-h.p. Eagle; Ray, 5-h.p. Benz; Evans Lombe, 10-h.p. Gladiator; J. A. Mills, 10-h.p. Gladiator; H. Egerton, 16-h.p. Gladiator; Perry, 5-h.p. Wolseley; Griffin, 12-h.p. Gladiator; Major A. V. St. John White, 6½-h.p. Gladiator; J. N. Brereton, 6½-h.p. De Dion; A. E. Fellowes, 16-h.p. Panhard; H. W. Bennett, 12-h.p. Panhard, driven by the Hon. C. S. Rolls; H. R. Everitt, 6½-h.p. Regal; A. E. Jarvis, 9-h.p. Dennis; E. Estcourt, 14-h.p. Brooke; H. G. Barclay, 12-h.p. Napier; A. Tritton, 16-h.p. Mors; H. L. Clark, 6½-h.p. De Dion; H. W. Williams, 4½-h.p. De Dion; B. H. Vores, 5½-h.p. Locomobile; W. C. Crawshaw, 14-h.p. Brooke, Mr. Crawshaw had also present a 6-h.p. Daimler, driven by Miss Savory of Sunrising, Warwickshire; R. Lawrence, 14-h.p. Brooke; and J. J. Dawson Paul, 16-h.p. Napier. The cars were arranged in lines in front of the main entrance to the Hall,

An 18-h.p. Clement Car fitted with special Phaeton Body by Messrs. Rothschild et Fils. The body is made entirely of aluminium; the front seat on the left swings forward, giving direct access to the back seats. The rear passengers are protected from dust by the brougham-like portion at the back, and by the aluminium canopy which forms a continuation of it.

with its splendid pillars and beautiful statuary. The guests of the day were received by Lady Hastings and cordially welcomed into the Hall.

KENT.

THE Kent Automobile Club were most hospitably entertained to tea by Mr. and Mrs. Bernard Arnold on their island in the Medway at Snoll Hatch on Saturday, over fifty members and their friends accepting the invitation. The event was all the more enjoyable as the party had to proceed up the river in boats for about a mile before the island was reached. The club have a run to Sevenoaks to-day (Saturday).

YORKSHIRE.

MANY entries are already promised for the Motor Gymkhana to be held on Monday, the 24th inst., by the Horsforth Agricultural Society, with the assistance of the Yorkshire Automobile Club. Entries should be sent to the secretaries, Messrs. T. Clough and R. B. Thackeray, High Royd, Horsforth, Yorkshire, by Wednesday next. There will be five events, comprising a bending race for motor-carriages, coach-house handicap, motor-cycle, obstacle and bending race, ladies' passenger handicap, and a legal limit contest. The full course will be about one-fifth of a mile over the grass, and the judges are Messrs. H. Briggs and W. Braithwaite.

SCOTTISH.

IN connection with the Scottish Automobile Club, a meet took place on Saturday at Coll-Earn, Auchterarder, by invitation of the Rt. Hon. Sir J. H. A. Macdonald, K.C.B., Lord Justice-Clerk of Scotland and president of the club. Unfortunately the rain came down in torrents both at Edinburgh and Glasgow, thus diminishing the number of guests by quite half. Shortly after noon the first car arrived from Edinburgh, and for an hour afterwards the road presented a stirring spectacle as the cars arrived at brief intervals. They were drawn up in line in front of Coll-Earn, and the visitors, after inspecting the lovely policies, were entertained to lunch, the Lord Justice-Clerk being assisted in receiving and entertaining his guests by his son, Mr. Norman D. Macdonald, advocate, and Mrs. Macdonald; and also by Professor Dawson Turner, M.D., one of the vice-presidents of the S.A.C., who is at present staying with his lordship.

Amongst the cars present was the De Dietrich of Mr. Geo. M'Millan, secretary of the eastern section of the club. Mr. John Adam, chairman of the western section, was on his Wolseley car, and Mr. J. Smith, general secretary of the club, was also on a Wolseley car. Major Reid and Mrs. Reid were on a Renault car, while Mr. Reid's brother, Mr. Andrew Reid, came on a steam car. General and Mrs. Alex-

ander were on an Oldsmobile car, and Mr. Douglas Croal, of Edinburgh, made a good journey on his Napier. Mr. Drummond, Stirling, was on a motor-tricycle. Professor Dawson Turner had his Delahaye present, and the Lord Justice-Clerk also had a car of the same design for inspection by the members in front of the house. The health of his lordship was proposed by Mr. Adam, and the Lord Justice-Clerk returned thanks for the hearty response which had been given to the toast. In the course of a short reference to the Motor-Car Bill, he said he had no doubt that members of the Scottish Automobile Club would act as educative instruments in their own districts and places, and that very soon the public mind would find out how absurd its fears were, and how absurd all this excitement was about motor cars. He further remarked that time was on the side of progress in automobile matters and in the education of the public mind. There was no doubt that automobilism was about to prove of the greatest possible benefit to the public. He was sure that the members of the club would make the best of anything imposed upon them by Parliament, and that the increased knowledge of the public upon the subject would soon cause a more reasonable view to be taken. Tea was afterwards served on the lawn, and, notwithstanding the unpromising weather conditions which prevailed throughout the day, a most enjoyable afternoon was spent. A large number of ladies also accompanied the motorists.

Where no alleged speed is given it is understood to be above the legal limit.

THE driver to the Duke of Marlborough has been summoned to appear at the Deddington Petty Sessions on the 21st, for furiously driving a motor-car. The Duchess of Marlborough and the Hon. J. Choate, the American Ambassador, left Blenheim Palace on Bank Holiday for Broughton Castle, near Banbury. When near Deddington, about six miles from Banbury, the police ordered the driver of the car to stop on account of its alleged excessive speed. The automobile was afterwards allowed to proceed, on its being ascertained that it belonged to the Duke of Marlborough. The police had measured a portion of the highway, and allege that the car was going at a rate of about twenty-five miles an hour.

IN the case against Mr. W. Bashford, who was fined for driving a motor-car above the legal limit at Rake, in Sussex, the usual trap was laid and his distance was taken from a piece of paper in a tree a furlong away from where the policeman was in hiding on a down hill grade. He said the speed was seventeen miles an hour. A fine of £5 was required to settle such a rate of speed, whereas in other districts motorists whose speed is twenty-five miles and more are let off with a fine of £3.

POLICE TRAPS.

MOTORISTS around Tunbridge Wells should be careful in driving between Mark Cross and Frant, the capturing spot being between Mark Cross and Saxonbury Hill.

THE traps on the Portsmouth road and also the Hook road at Surbiton are in active working order.

AT Staups, near Halifax, five roads converge, and there the police have established a trap for motorists.

INFORMATION comes of a trap at East Grinstead, about a mile this side on the London road. It is reported that this is worked with the aid of a piece of boarding, with which the cars of motorists not stopping are threatened. Should a car not stop this may be thrown across the road.

NEWS of a Scotch police trap comes to us for the first time. This is between Kileraggan and Cove, on the north side of the Clyde. We shall be pleased to receive information of others for the benefit of motorists touring north of the Tweed.

THE police in the Crawley district are taking great interest in motorists, who should be very careful in passing the county boundary, about two miles on the London side of the town. Between that point and nearly a mile beyond the railway crossing several traps have been established.

STOP watches have been dealt out to the Barnet police. Great caution will therefore be necessary in the neighbourhood of Barnet.

MOTORISTS in many country places have been annoyed by the inconsiderate way in which strangers have driven through their streets and lanes. Lincolnshire seems to have suffered lately from this cause, and the county, which was once entirely free from police traps, is no longer innocent of such devices. The late chief constable of the county was a friend of motorists and distinctly forbade the superintendents and inspectors to lay traps, and instructed them to only take action where strong complaints were made. Now, however, in consequence of the rapid driving of one or two strangers in the county, the police have decided that the Lincolnshire roads shall not be employed for record making, and traps are no longer unknown.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

VOL. V.]

LONDON, SATURDAY, AUGUST 22, 1903.

[No. 233.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

AN "ACT" OF DISCOURAGEMENT.

THE more we think about the Motor-Cars Act which will come into operation in January next, the more we are astonished and amazed at the simplicity, if not the absolute incompetency, of those who have hitherto been regarded as the leading lights of the automobile world. Time after time have we heard it said that no new industry has been so blessed with the interest of men of intellect and good sense as the automobile movement; in fact, some have gone so far as to compare the committee of the A.C.G.B.I. with the Cabinet. Such being the case, motorists generally have been astonished that the deliberations of these wiseacres have resulted in the passing of a Bill which will have the most pernicious effect upon the motor-car industry in the future.

The Automobile Club and the so-called Parliamentary Motor Party may be expected to indulge in mutual recriminations. That this is not improbable was apparent from the resolution of the former body which we published last week, in which the Club "entirely dissents from the views of those who were considered to be acting as the representatives in the House of Commons of that organisation." Unfortunately, however, the original sin must be laid at the doors of the Automobile Club, for it was within the walls of that institution that the question was first brought forward. We declared at the time it was inexpedient, and all along have maintained that such procedure was quite unnecessary and unwise. As a matter of fact, at the moment the question of the numbering proposals and speed limit were brought forward by the Club, police persecution had mostly ceased, except, of course, in one or two counties and some other isolated instances. Had the matter been allowed to right itself, motorists and the police would probably have been on the best of terms ere now, but the inauguration of a long campaign has done much to embitter the position and to render any armistice almost impossible.

Time also was on the side of the motorists. An increasing number of cars were being sold, and it would have been the matter of only a few years before every country gentleman would have owned a car.

It is interesting, too, to know that the class of vehicle sold in recent years was of a more expensive kind than previously. Four-cylindered cars are greatly in demand, demonstrating that the "classes" have realised the charms of motoring. Had the more practical and active motorists on the club committee listened to other users of the road, it would have been better for the present day-motorist, as well as for future owners. Matters of importance might then have been dealt with in a way more in keeping with the feelings of the average man who motors.

That the Act under which Light Locomotives have been run upon public roads has not, after all, worked so hardly upon motorists is proved in the case of a gentleman who, when being fined recently, stated that he had previously driven 80,000 miles on his motor-car, and had never been summoned. This gentleman has always had the latest machines, and is by no means an exception. In fact, it has been frequently stated in evidence, that motorists had previously driven 8,000, 9,000, and 10,000

miles without having been spoken to by the police. There are a large number of owners of cars who spend nearly the whole of their time on their vehicles, and have never experienced any great hardships in this direction. For ourselves, the total fines and costs which we have had to pay do not aggregate twenty guineas, although our mileage has been considerably more than that number of miles in thousands.

It seemed to all appearances as though the prejudice against motorists was breaking down, when a bomb was thrown into the camp by gentlemen whose legislative position should, at least, have given them experience, and have taught them that in these matters the man who says least often gets his own way when those who precipitate action frequently fail. As soon as the abolition of the speed limit was mooted, the cry was raised that "these motorists want to go faster." That "they were not satisfied with the speeds at which they then traversed the roads," and the public became unnecessarily alarmed. A fit of nerves seemed to have affected rural councils, and the police were harassed into action. This was the direct result of an agitation which the Club, instead of fostering, should have discountenanced.

The Motor-Cars Act which will shortly come into operation, is quite unique so far as the Statute book of this country is concerned. Unfortunately, its application will be at the mercy of prejudiced justices who have hitherto lost few opportunities of showing their opposition to newer forms of vehicular traffic.

With regard to the punishments proposed by Mr. Long's measure, with the introduction of which the Club's action had so much to do, we can only say that they appear to have been admirably framed to either kill a growing British industry or create a new convict class. Safeguards are said to have been introduced, but they will prove in practice generally inadequate to protect motorists from persecution, and will be found practically worthless. True there is a right of appeal, should a driver be fined 20s. or more, and for that small mercy we are correspondingly thankful. But this even is a very slight sort of safeguard, and will be of little consolation to the motorist who drives carefully and with consideration to other users of the road, and then finds the calculations of the police show he has been going a few yards more than twenty miles an hour. For offences not specifically mentioned imprisonment can also be inflicted—whether there is a right of appeal or not, experience will show. Should a few members of the Parliamentary Motor Party fall victims to this particular clause, it will afford them opportunity for reflection on their own weakness during the last few days of the recent Parliamentary Session.

We would have been content with the registration and numbering—irksome and undignified though they be—had the speed limit been abolished, but, as we have already pointed out, the arbitrary fixing of speeds of twenty and ten miles an hour will prove far more dangerous to the public than if motorists were allowed the ordinary privileges of men exercising their common sense. Of course, the enactment of the lower limit within certain populous areas may have been, and probably is, a wise precaution, but had the Act enforced that such districts should have been distinguished with notice boards, calling upon all motorists to proceed cautiously until passing the next, it would have been sufficient. But for the speed limit of twenty miles nothing at all can be said. It is arbitrary, it will not ease the police

of their present unhappy position as acting as trappers to the public, and will give rise to litigation, over which only the lawyers can rejoice.

There is one matter which was put into the Bill at the last moment, however, which should be seriously considered, and, although the Act is now unfortunately part of the law of the land, we trust that the provincial clubs and individual motorists throughout the country will make it clear to the Local Government Board that any strict rendering of the new Clause will absolutely close the larger portion of England to tourists. This reads as follows:—"The Local Government Board may, by regulations made under Section 6 of the principal Act, prohibit or restrict the driving of any motor-cars, or of any special kind of motor-cars, on any specified highway, or part of a highway, which does not exceed 16 feet in width, or on which ordinary motor-car traffic would, in their opinion, be especially dangerous."

This practically gives, as we suggested last week, to an official authority power to prohibit motor vehicles from entering many of the touring counties of the country, as well as entering or leaving hundreds of the smaller towns. Apparently, if a couple of local farmers complain that a passing motor-car has caused dust to be deposited on their cabbages, or if a nervous J.P., full of wrath against innovations, asserts that he cannot cross

Mr. J. M. Sneden, Hon. President of the Automobile Club of Algiers, and his 12-h.p. Georges Richard Car.

to the other side of the lane in safety, the Local Government Board will have power to close that roadway altogether to motor traffic. If this sort of legislation is to be tolerated, there is no reason why the roads should not be divided up into playgrounds for those who live in proximity; and travel, except by railway or on other tracks, absolutely prohibited. We are surprised that Mr. Long should have introduced such a far-reaching clause without giving opportunity for proper discussion; and we are amazed that the Parliamentary Motor Party, reputed to have been over a hundred strong, should have allowed it to be added without a protest. They were keen enough in moving puerile amendments until properly rebuked by the President of the Local Government Board.

This new clause was added at the last moment, and was inserted after the Bill had been through the committee stages. Then it was taken to the House of Lords and received the Royal assent within twenty-four hours. We can only compare this unwonted celerity to the speed of a car capable of winning such an event as the Gordon Bennett race.

After all it is really a pity that the so-called Motor Party was formed, for we believe that the sense of fairness of the

average M.P. would have prevented many of the absurdities of the Bill being passed into law. Unfortunately, however, there were those in the House who claimed to speak on behalf of the whole automobile body, and they, with their constant and wearying suggestions of compromise, were accepted by the bulk of the members as the spokesmen of motorists generally. "Blessed is he who knows no man that calls himself friend" might be said of motorists as of others. The suggestions for compromise so frequently made by our leader (sic) would certainly have done no good, and it would have been far better if the whole of the onus of the legislation had been thrown upon the Government, instead of motorists having been made a party to the Motor-Cars Bill. It is all very well for the Club and Mr. Scott Montagu to disassociate themselves now from authorship of the Bill, but, as we have said, their agitation had much to do with its initiation, and it is somewhat unfatherly on their part that they should now seek to disown their offspring.

In his own journal Mr. Montagu assumes that the dust question is one for motorists to solve. Really, we do not see why they should be regarded as the cure-alls for local neglect. The dust question is one for the road surveyors and the local authorities to consider and solve, for the dust is lying about on the roadways and is often disturbed by the wind without traffic of any sort. Naturally, when motor and other vehicles travel over it at a rapid rate of speed, it assumes greater volume than at other times, but that motorists should be made responsible for this seems as inconsistent as are many other utterances made by our Parliamentary leader. According to this gentleman, there are 150,000 persons connected with the motor industry, probably an exaggeration, which we must forgive, though like many other of his exaggerations, we cannot wholly forget it. But to suggest as some have done that these should not vote for any candidate in any election, unless he promises to vote for the repeal the Act, is absurd. This is advice hardly calculated to add to the dignity of the position, or to do any good, for it must not be forgotten that motorists are in a great minority, and if the majority of the public decided to vote the other way, the precious Act of 1903 would remain on the Statute book for a good many years to come.

In our opinion the proper course now is for motorists to become educators of public opinion in this matter. Motor-cars should be lent to candidates of all shades of opinion in municipal, county, and Parliamentary elections. By thus assisting their campaigns, public men will be shown how safe are motor-cars, and will probably become converts to automobilism. Thus we shall ultimately have in the House of Commons itself a sufficient number of practical persons who may be expected to legislate, not only with full regard to the safety of the public, but also with some consideration for the welfare of a great industry. Although we feel that much of the blame for the present unsatisfactory state of affairs must be apportioned to Mr. Scott Montagu, old acquaintanceship leads us to restrain our feelings. At the same time, we cannot help expressing our regret that he should have failed to carry out the views of motorists in the matter, especially as he himself is interested in the industry. The resolution that the Club committee have already adopted should be sufficient to teach him wisdom in the future. There is no doubt that a great and growing industry has been throttled, and how long it will remain thus hampered depends upon the action of motorists themselves during the next few months. We hope, therefore, that they will adopt no such one-sided advice as to attempt to make the repeal of the Motor-Cars Act a test question, but rather show a better spirit in seeking to teach everyone in a position of influence the safety and absolute control associated with the modern motor-car.

A PROPOSAL is already on foot to hold a special dinner in the autumn and to present illuminated addresses to Major Jameson, M.P., and Mr. Dalziel, M.P., for their strenuous efforts on behalf of motorists. "When all others failed they alone proved staunch and true."

COMMENTS.

Motors and Railways in Ireland.

SEVERAL suggestions have been made with regard to profitable routes for the Iveagh-Pirrie motor transit scheme in Ireland. Mr. R. Galbraith suggests a route from Birr via Portumna, Killimore, Loughrea, Kilchreest, Ardahan, Kinvarra, New Quay to Ballyvaughan, of about 65 statute miles. An alternative route from Birr via Banagher, Eyrecourt, Lawrentown, Kiltormer, Kilreeckle, Loughrea, here cuts in on the other route; the distance, Birr to Ballyvaughan via Banagher, is the same. Both routes would open up large districts of County Galway at present unconnected by public conveyance with existing railways. The routes suggested would connect these large districts with outlets at Birr, Banagher, Loughrea, and Ardahan, and bring the midlands of Ireland into daily touch with the west. At present the journey by rail from Birr to Athenry, via Limerick, a distance of about 124 miles, occupies nine hours and ten minutes, the actual distance from point to point being about fifty miles. Such a service would enable travellers to make the journey from the Midlands to Galway, Sligo, Mayo, etc., in the day easily, at present an almost impossible task. Thus the motor-car might be expected to play an important part in the railway development of Ireland.

And in England.

NOT only is there a possibility of motor competition with railways in Ireland, but the Earl of Onslow has been advising the farmers and fruit growers of Kent to stimulate the railway companies to provide better facilities for the carriage of produce by the use of the motor-car. Already this has proved useful in many ways, and we would urge the fruit growers of Kent to give heed to the advice of the Minister for Agriculture.

Railway Enterprise.

THERE is evidently greatly increased interest among railway managers in the development of motor-car passenger traffic. The few successful services of the kind which have been privately organised have convinced them that if such lines are not lucrative to the extent of cent. per cent. they are, at least, profitable as feeders to main lines of traffic. Here, probably, is one of the most useful advantages of the automobile so far as the railways of the country are concerned.

The Great Western's Venture.

THE Great Western Railway has decided on an experiment in this direction, and the place selected for the inauguration of the venture is the line between Stonehouse and Chalford, in the Stroud Valley, a distance of about seven miles. There motor-cars will be run upon the railways, and it has been decided to try the further experiment of running motor vehicles upon high roads. It is the intention to run these cars at convenient times in connection with the company's trains. Five motor vehicles have been ordered by the company. Two of these have already been delivered, and a service was commenced on Monday between Helston and the Lizard, in Cornwall. The other vehicles will be placed upon the railway during the autumn.

Railway Companies and Motor-Cars.

SPEAKING at the meeting of the Great Western Railway Company last week, Earl Cawdor stated that the company had suffered somewhat from the tram-cars, and, perhaps, also from motor-cars in private hands, and they were about to try two things which they thought worth trying. One was a motor-car service, consisting of a combined car carrying fifty-two

passengers, running on the existing line, stopping at stations which already existed, and also, by the approval of the Board of Trade, at level crossings and roads coming up to the line, thus making a quick local service. The motor-car was to be worked by steam, and it was hoped to be running in October next. The motor-cars on the roads would not only act as feeders to the railway, but would also give an indication of the requirements for light railways. They are covered cars supplied by the Milnes-Daimler Company.

Doctors and the Act.

SIR WALTER FOSTER has made a good point for motorists in saying that among the other objections which he has to a speed limit for motor-cars is that it will affect medical men who are summoned to come in all haste to cases of very serious illness. Whatever the emergency, and however skilful a motorist the doctor may be or may have on the car, he will be prevented from using his resources to the full that safety will permit in an emergency. Sir Walter's main objection to the speed limit is that it will, in his opinion, tend to driving at this rate of speed ordinarily, as it will be very difficult to get a conviction when a driver can plead he was well within the limit. Under the new legislation doctors in hurrying to the bedsides of patients will be incurring heavy penalties—although engaged on errands of life saving.

Care in the Trials.

NOW that the Trial Season is upon us, we would impress upon all responsible in any way for the arrangements the necessity of taking the utmost care in giving publicity to the results. They should be communicated simultaneously to the Press, no preference being shown to organs styled official or to journals unconnected with automobilism. In issuing results before they have been officially confirmed the greatest reserve should be maintained, as hasty publication may seriously injure competing firms. The public naturally pay some heed to the decisions of the judges in connection with Trials, and unless these are given with scrupulous exactitude, injustice may easily be done. Further, when corrections in official timing have to be made they should be issued to all the automobile Press and not merely confined to the competitor directly concerned. To have to go to a Scotch paper for corrections or errors made by the British Club in connection with Irish races is a roundabout way of learning results that is worthy of the Circumlocution Office.

The Proposed Irish Race.

IF Mr. Macredy's suggestion for an alcohol motor race in Ireland next year is likely to be acceptable to motorists, some official body will have to take early notice of the matter. The Act of Parliament under which the Gordon Bennett contest was legalised expires at the end of the present year, and will have to be renewed if the race is to be permitted. Otherwise there is little hope of the matter being allowed reasonable discussion in the Commons next year. The subject of motor road racing is so hemmed in with prejudices just now that even a promise of the conditions prevailing in the Gordon Bennett hardly satisfy some people.

The L.C.C. and Motorists.

AT the West London Police Court the other day, a prosecution was instituted against a motorist for "having emitted smoke," etc., in Kensington High Street, and the London County Council specially instructed a solicitor to prosecute. The case was called for two o'clock, but His Highness the Police Constable did not appear till past four o'clock, and then escaped without a reprimand. Twice the constable swore the defendant was the driver of the petrol car emitting smoke, but then, at the

bidding of the magistrate, had to confess he had made a mistake. In the end the case was dismissed and the defendant was mulcted in solicitor's (Mr. Staplee Firth) costs and the loss of his own time.

Police Rivalry.

SERGEANT JARRETT has a rival who rejoices in the name of Jannaway and delights in catching motorists on the Bath Road at Wargrave. Some results of his enterprise were apparent at the Wokingham Court the other day when he gave evidence against eight or nine motorists and secured convictions every time. Sergeants Jannaway and Jarrett are attaining unenviable fame in connection with motor-car cases; when the motorists commence action against drowsy carters, speedy tram-car drivers, and other roadway inconveniences, they may have to turn their attention to more monotonous duties.

1904 Mercedes Cars.

REGARDING the recent fire at Cannstatt it may be of interest to our readers to know that cars are still being "turned" out weekly, thanks to the assistance afforded by other engineering firms. As to the 1904 models the question of the details of these has been settled, and we understand that

A Roadside Discussion.

they will differ very little from the details of the "famous forties" of 1902, the clutch, gear, etc., being exactly the same.

At Gainsborough.

THE motor problem was to the front at the meeting of the Gainsborough Agricultural Society last week, when one of the speakers referred to "that common enemy of mankind—the motor-car," and thought that, in the interests of motorists themselves, it was desirable that there should be some regulation of speed. Sir Hickman Bacon, Bart., himself an enthusiastic motorist, also spoke of motoring, and commended to notice the successful experiments made in France and Germany with a fuel of alcohol, extracted from potatoes and other agricultural products, instead of the petroleum spirit, imported from America, used in this country. He did not see why a change should not be made in England, so that the fuel for the cars might be almost entirely manufactured at home. If magistrates

would make themselves acquainted with the subject upon which they pretended to adjudicate, he did not think there would be any more trouble with motor-cars than with bicycles. He believed that in twenty years there would be a great many more motor-cars on the road than horses.

The Speed of Tram-cars.

MR. MOFFATT FORD appeared at the West London Police Court on Tuesday to support a summons charging a London United Electric tramcar driver with having driven at more than 10 miles an hour. He explained that his object was to demonstrate how a tramcar could travel at 17 miles an hour, while a motor-car was forbidden by the new Act to go at more than 10 miles an hour in towns and populated districts. The case was adjourned to enable the magistrate to look up the authorities on Board of Trade powers. There is no doubt that the time is coming when motorists will have to carry the war into the camp of the enemy.

Comparative Safety.

ON this point of the speed of tram-cars Mr. A. J. Balfour has made an important observation to a Dundee correspondent. "The new Act," says the Premier, "does not authorise 20 miles an hour where that speed endangers the public safety, about which you are rightly solicitous. I think you probably underrate (if I may say so) the control which a driver of a motor-car can exercise over his vehicle. A motor-car going 20 miles an hour is far safer than a heavier tram going, as they habitually do, 16 or 17 miles an hour, is far more in hand, and involves far less risks." And yet tram cars are constantly allowed to run at the higher speed.

'Ware of Warrants.

UCKFIELD has an unenviable reputation among motorists, and the chairman of its magisterial bench, Captain Noble, hardly lets an opportunity pass without letting his tongue wag freely about automobiles. The other day the Uckfield magistrates announced their determination to issue warrants in future for the arrest of motorists who did not appear when summoned for exceeding the speed limit, and Captain Noble, the chairman, said they were not to be defied by motor-car people any more than by the commonest tramps.

Hurrah for Havre.

IN view of the uncertainty of the administration of the new Act and the genuine fear of its vindictive application, many leading motorists are already discussing the advisability of taking a club-house and garage at Havre with a view of keeping their cars there and enjoying the pleasures of week-end motoring. These men are neither "scorchers" nor "road hogs," but English gentlemen who only desire to take their pleasures in peace, and do not care to risk, perhaps on the evidence of a policeman and road-breaker, their liberty or suffer the indignity of being fined without cause.

Supporting the Clubs.

DURING the next few months motorists will have to be very careful as to their procedure, so that application may not be made for the enforcement of the ten-mile limit in other than the most dangerous places, and the formalities connected with registration and the issue of licenses may be made as light as possible. Throughout the country are many clubs doing good service to motorists, and these should be supported by local automobilists. In thus identifying themselves officially with the movement its influence can be materially strengthened.

**Tit
for
Tat.**

IN view of the introduction of the new Motor Cars Act, which comes into force on Friday, the 1st of January, 1904, a novel state of affairs is likely to be created. Motorists, it is understood, intend themselves to see that the law is strictly carried out, and not only do they propose to obey the law—bad as it is—but they also think of acting as policemen, and in the interests of the general community propose insisting upon the inhabitants of Great Britain fulfilling to the letter the various other statutes now practically remaining dead letters on the books. There is ample scope for motorists' energies, and while Robert reclines 'neath shady trees or basks in sunny glades, puffing dreamily at his pipe, the busy motorist will be carrying out his duties, not necessarily with the hope of fee or reward, but solely from the desire of proving to his fellow citizens that he is no whit worse than they are.

Police Sport.

A NOVEL competition was introduced at the annual sports of the Oxford City Police—a "motor speed-judging competition." A motor-bicycle was driven once around the track and the policemen stood at intervals of about twenty yards. Each, without a watch, was expected to estimate the speed at which the motor was travelling. The winner was P.S. Fumage, who under-estimated the actual speed by one mile per hour, guessing 23 miles instead of the 24 registered by the time-keepers.

Early Action.

THE Hampshire County Council is the first county authority to consider its relation to the new Act, the Earl of Northbrook moving the suspension of the standing orders to allow the discussion to take place. He suggested that a circular should be addressed to all the district councils, requesting them to recommend the various roads upon which they thought the ten mile per hour limit of speed should be applied within their districts; also that the county boroughs of Portsmouth, Southampton, and Bournemouth should be written to and asked whether, in their opinion, any portion of the county ought to be included in the limited area which they proposed. It was possible, for instance, that on the outskirts of Bournemouth there might be certain districts belonging to the county which ought to be included in the limited area. When those returns were received, he thought they should be considered by a committee composed of the following:—Messrs. W. W. Portal, Simonds, Deverell, Gathorne Wood, Colonel Grimston, the Hon. J. Scott Montagu, M.P., and J. Bonham Carter. Besides this, the Standing Joint Committee should be asked to request the Chief Constable to attend the meetings of the special committee, and to give to the District Councils any information and assistance they might require. The special committee might also communicate with the Local Government Board semi-officially, and ascertain the views of the department. Evidently the councils generally will not delay their action in the matter.

**Reliability
Trials.**

THE Automobile Club's reliability trials for motor-cars have attracted a record entry of 130 cars. They will be held this year from September 18th to the 26th inclusive. It will be the observer's duty to note every stoppage for repairs or adjustments, and even for filling the petrol tanks, so that an absolutely reliable report will be obtained as to the performance of the cars over a thousand miles of road. The routes of the trials will extend from the Crystal Palace to various seaside places and back on the same day, so that a large number of people will have an opportunity of witnessing the performance of the cars during the trials. The places to be visited include

Margate, Folkestone, Eastbourne, Bexhill, Brighton, Worthing, Southsea, and Winchester. The trials about to be held will be followed by extensive tests for light delivery motor-vans, which will take place early in next year. The principal aims of the forthcoming trials are threefold: to encourage the makers, to indicate the most desirable types of car, and to afford to the purchasing public reliable and independent reports as to the capabilities of motor vehicles.

Garage Scandals.

FROM time to time we have received particulars of instances where proprietors and managers of garages have abused their trust by using cars left in their charge. A glaring state of affairs prevailing at a West End garage has been brought to light in an action at the Westminster County Court by a Mr. Williams. So far it has been difficult to obtain authentic particulars, sufficiently corroborated for publication, but the facts as narrated to us are that the plaintiff claimed damages of the manager and his staff for having unduly used his car whilst it was stored upon the premises. Counsel were employed on both sides, the plaintiff receiving, after a scathing summing up by the judge, a verdict for £20 and costs.

Friends at Last.

The Irish Demand.

COMING so soon after the automobile tour, the King and Queen's trips by motor-car in Ireland must have wonderfully impressed the gentry of the country with the possibilities of the new vehicle. North, west, and south, the automobile has proved its capabilities, travelling rough roads, climbing the stiffest hills, and altogether behaving in a way that should render easier the paths of the motor agents in Ireland. The motor-cycle has "caught on" there, and there is no doubt that as the prosperity of the country increases, the motor-car industry will share in the result. Those who have hitherto despised the Irish demand should modify their views without delay.

**In
Sunny
Southsea.**

SOUTHSEA has several times been made familiar with motor-cars in connection with official events, and, although the "season" has been an uncertain one there up to the present, automobiles are regarded as ordinary and commonplace in that popular resort. Several local firms have catered with enterprise for local wants and the requirements of travellers through the district, and the locality is about as well provided with suppliers of petrol and repairers as any in the South of England. Of late the place has been growing in popularity with motorists especially for week-end trips, and dozens may be seen

spinning along the delightful sea front every Sunday morning. The rural "bobby" has wakened up to this, and to the opportunities it gives him, and now traps are laid on every side for the *chauffeur* approaching Portsmouth. That some county magistrates, in many cases, are prejudiced against motorists is evident from a conversation which took place at the Fareham police court not long ago. One of the motorists bagged told the Bench that he had never been in the district before. "I hope you won't come here again," was the presiding magistrate's discourteous and quite uncalled, for reply.

Brakes.

THE distressing calamity, terminating fatally, which recently occurred on the Sun Rising Hill should be a warning to all automobilists as to how a very dangerous hill should be descended. The brakes on a car may be excellent, and, without doubt, those fitted to the majority of motor-vehicles are, but, notwithstanding this, one can never tell when anything may happen to them, and if an accident of this nature should occur, the hill may be too steep and winding (as in the case of Sun Rising Hill) for the car to be stopped by other means. Undoubtedly the best and safest method of descending a really dangerous hill is to start with the slow speed engaged, and the engine switched off; this forms a most efficient brake, and the hand-brake, if it does not withdraw the clutch, can also be used as an additional brake. If only the really bad descents in this country were dealt with in this manner, we should hear very little of cars "getting out of control" downhill.

Road Maps.

MESSRS. GALL AND INGLIS are issuing graded road maps of Scotland, and from the specimen we have received, viz., Aberdeen and Deeside, they appear to be admirably designed to meet the requirements of the motorist. Steep and dangerous hills are clearly indicated as well as good and bad roads. The same firm are also publishing "strip" road maps on a scale of half an inch to the mile dealing with some much-frequented districts, such as Manchester, Carlisle, Liverpool, etc. For the benefit of southern motorists, Mr. A. C. Armstrong and Mr. H. R. G. Inglis have compiled and Messrs. Gall and Inglis have published a new "contour" road book, "Short Spins Round London, south of the Thames." This is so well done that we await with considerable pleasurable anticipation the appearance of the volume dealing with the district north of London's great river.

Petrol Motors.

ONE of the interesting items in connection with the recent International Automobile Congress in Paris was a report on the present position of the petrol motor by M. Gaillardet, who gave some very interesting data concerning the dimensions and construction of the various parts. He insisted upon the necessity of giving more attention to the flywheel, which, he said, should be looked upon as an accumulator of energy capable of giving up a certain part of its energy to overcome inertia when starting a car. In other words, more power may be needed to start the car than that developed by the motor itself, and thus during, say, a quarter of a second the energy stored up in the flywheel is added to the power of the motor to move the vehicle. For this reason the weight of the flywheel should be calculated according to the inertia to be overcome, that is to say, the weight of the car and the speed at which it is started. M. Gaillardet is in favour of high compression on account of the higher efficiency it gives to the engine, but in practice it is impossible to exceed a certain limit, because very high compression would mean great difficulty in starting the motor and in regulating the admission, while with small flywheels the force of the shock would cause the motor to run irregularly, and it would be nearly impossible to avoid leakages at the valves and joints. For these reasons the compression ought not to be much more than five kilos per square centimetre. He also concludes that the motor gives highest efficiency

with a comparatively long piston stroke and high lineal speed, and in this respect he is somewhat at variance with current practice, which gives a preference to short stroke motors.

Oiling Indian Roads.

IN Bombay the dust question has become a matter of municipal politics, and the City Engineer has been making experiments with a view to a mitigation of its objectionable features. A portion of the Esplanade Road was treated with crude petroleum, three dressings being given, the first on the 26th of November last, when about 5½ tons or 1,298 gallons of the oil was sprinkled; the second on the 21st December last, when about 3½ tons or 737 gallons was used; and the third on the 22nd of February last, when 1½ tons or 413 gallons was used. The quantity of oil was diminished at each subsequent dressing. The oil was laid by means of the ordinary watering carts and cans, and then equally spread over the road surface by means of brooms and brushes. On the first application the oil soaked quickly into the road surface, rendering it smooth and firm, but it was slightly slippery where, owing to unevenness of the surface, there was a stagnation of oil in the hollows. It also gave off a strong smell for a day or two in the beginning, but it gradually disappeared. The application of oil to the road surface not only lays down the dust and renders the surface smooth, but prevents the road from being cut up.

MR. J. E. HUTTON has just received delivery of the first 18-h.p. Mercedes car which has been turned out of the Cannstatt works since the fire.

THE Selection Trials for the British representatives in the Gordon Bennett race of 1904 will be held during the latter part of April next, entries to be made, accompanied with a deposit of £250, by December 31st of the present year.

MR. W. J. BULL, M.P., who, we believe, is one of the private secretaries to Mr. Walter Long, has written a letter in defence of the way the motorists' case was presented in the House of Commons. Unfortunately its effect is marred by the needless introduction of a spirit of political partisanship.

COLONEL SIR H. MONTAGUE HOZIER has yet to be converted to the automobile. Presiding at the annual meeting of the Cab-drivers' Benevolent Association the other day, he said that cabmen had to resist the invasion of the motor-car. "It is rising up amongst us, but I dislike it, no matter whether I am walking or driving."

MESSRS. H. E. HALL AND Co., of Tonbridge, have sent us two photographs showing part of the new works and garage they have recently erected. In addition to being agents for Darracq cars, Messrs. Hall have every facility for repairs to every make of car, and stock accessories of all kinds, as well as Michelin and other tyres.

THE London Express Motor Service, Limited, is about to put a service of motor hansoms on the streets of London. The cabs will not be let to drivers at a fixed sum per day, as is usual with horse-drawn cabs, but the driver will receive a minimum weekly wage, with a liberal percentage upon the balance taken per week over a certain sum.

MR. CHARLES GLIDDEN, who is making a trip to the Arctic circle in a Napier car, cabled from Gefle, Sweden, on the 12th inst., that he had reached the latitude of 60 deg., and hoped to cross the circle within eight days. A further telegram was received on the 17th inst. from North of Niska, Lapland, stating that he had succeeded in crossing the Arctic circle, at Haparanda, on Sunday last.

MR. JAMES BAGGS, of Southsea, had a serious accident while motoring on Saturday afternoon. When descending West Marden Hill, the most dangerous hill in the county of Hampshire, neither of the two brakes had any effect in checking the speed of the car, and, in order to prevent a worse fate, the driver had to steer it into the ditch. The car was rendered a complete wreck, and the passengers were severely shaken.

THE CHURCH AND THE CAR.

MANIFOLD are the utilities of the automobile, and in no department of public life have they been so conspicuous as in recent electioneering contests. In fact, some have declared that the increase in the number of the electorate who have polled has been due to the better facilities provided candidates and voters by the motor-car. As compared with the ordinary horse-drawn vehicle its advantages are easily apparent.

The uses of the motor-car to politicians are equally available to the clergyman with a large parish. The country clergy often find their enthusiasm cramped and their activities restricted by the absence of travelling facilities in rural districts. Parishioners live miles from railway stations, trains only proceed at regular and often infrequent intervals, and to reach distances comparatively near long journeys have to be undertaken, owing to the cross-country direction of railroads. All these factors contribute to render difficult the pastoral visitation which is the strength of the religious systems of this and other countries.

When Dr. Jacob recently removed from the Newcastle diocese to that of St. Albans, a motor-car was suggested as the most valuable form the farewell presentation could take, and there is no doubt the idea was but anticipating what will be ultimately regarded as part of the ordinary equipage of the Bishops. A few months ago we reported how an ecclesiastical leader in the Midlands would have missed some important cathedral services but for the timely service of a motor-car. Military chaplains have used the tonneau of an automobile as an improvised pulpit, and the appearance of ecclesiastics on motor-cars is nowadays regarded with less public curiosity than was the case a few years ago.

The accompanying photograph is, however, probably unique. It was taken by His Grace the Archbishop of Dublin (Dr. Walsh) after his memorable ride over a portion of the Gordon Bennett course. We had reached Cookstown, near the little village where the American team made their headquarters, and were about to enjoy the hospitality of the Rev. Fr. Warren, who is to be observed seated to the right of the Rev. Dennis Pettit, chaplain to his Grace, who is seen standing in the tonneau. The Archbishop and his chaplain can both bear their testimony to the value that the motor-car would prove in visiting parishes otherwise inaccessible, and thus increasing their opportunities of service. A few days ago His Grace was in the neighbourhood blessing a new bell in Ballymount Chapel and gave some reminiscences of earlier visits. "My first visit to Ballymount and its neighbourhood," he said, "dates back to close upon forty years ago. I was then a student in College, and was brought here by the Archbishop of that time, your illustrious fellow-parishioner, Cardinal Cullen. I recollect even the most trivial incidents of the visit as if they occurred but yesterday. Of one of them, trivial enough in itself, I was forcibly reminded by contrast when I last happened to pass this way on this day four

weeks. Coming from the train at Newbridge, we travelled by that very convenient and not over-pretentious vehicle, an outside car. As I have said to you, I was forcibly reminded of this by contrast when I happened to pass along the road outside four weeks ago. It was on the eve of that exciting contest of which this part of Ireland was recently the scene, and I found myself that day sweeping past Ballymount, along the same road, upon a very different kind of vehicle, and, I must admit, at a wholly different rate of speed." Fortunately for His Grace, the Irish Constabulary are good sportsmen, and were delighted to see him rush along at the rate of over fifty miles an hour. There was no speed limit in Ireland during the days of the automobile tour, and the Archbishop had a practical demonstration, not only of the speed of the modern motor-car but also of the control which the driver can have over his vehicle.

While briefly drawing attention to this matter, there is another point brought forward by the Rev. J. Gregory Forbes, rector of Dickleburgh (Norfolk), which motorists should consider.

Realising the advantage that motorists take of Sunday for the pursuance of their pastime, he has written on the "unnecessary disturbance of Divine worship on Sundays," and asks that they should slow down while passing near to churches or chapels during hours of service, thus obviating the necessity for vigorously blowing the horn and interrupting the flow of pulpit thought while distracting the attention of the congregation.

This is a simple matter in which motorists may well show their consideration for others. Unfortunately in this, as in other ways, the inconsiderateness of a few people has brought discredit on the whole movement, and there are clergymen inclined to regard those who motor as driving "engines of Satan" and having no regard for others. This

is not true of the great majority, who recognise that they share the roads equally with horse-drivers and pedestrians, and do not wish to do anything likely to cause annoyance and irritation to other people.

A STEAM motor-van for the conveyance of meat from the slaughter-house at Bandora to the Crawford Market, in Bombay, has lately been completed. The waggon has a carrying capacity of three and a half tons, and can travel at the rate of five miles an hour. Only the machinery was obtained from England, the woodwork having been made in the local municipal workshops. The van measures 12 feet by 5 feet, the inside being fitted up with hooks on which to hang the meat, the sides being perforated. The suggestion to replace the old noisy meat-carts by the new vans was first made by Khan Bahadur M. C. Murzban, the executive engineer, who, in company with Mr. Hewett, assistant engineer, mechanical branch, made a trial trip in the car. The car was started from the Crawford Market, Bombay, via the General Post Office, to Chowpati, and thence back to the Market. The trip is said to have been exceedingly satisfactory, and it is hoped that ere long the bullock-carts will be entirely superseded by automobile vans.

(His Grace the Archbishop of Dublin.)

CONTINENTAL NOTES.

BY "AUTOMAN."

THE summer weather this year has still to come to the Continent. From all directions the reports bring in dismal accounts of continued rain and wind. The bad weather has even kept some motorists in Paris, and really a most enjoyable holiday may be passed in trips around with Paris as a centre. As many Englishmen spend some of their summer in the French capital, it may be interesting to them to read of trips they may make during a short stay, and I propose, therefore, in the automobile "dog days," when interesting news gives way to "big gooseberry stories," to give a series of pleasant excursions which they may make from Paris.

THE forest of Fontainebleau is sixty-eight kilometres (about 42 miles) from Notre Dame in Paris. It is therefore easy to make the journey there and back in the day in almost any modern automobile, with a few hours to spare to visit the Palace and the Forest. Starting from the Place de la Concorde, cross the river Seine at the Pont de la Concorde, which faces the Chamber of Deputies, and turn to the left into the Boulevard Saint Germain, the most aristocratic quarter of Paris. Follow along until you come to the Boulevard St. Michel and turn into it to the right and continue along uphill until you reach the Boulevard de Port Royal, into which turn to the left and keep on until you come to the Avenue des Gobelins, into which you turn to the right, climbing a steep hill which leads into the Place de l'Italie, which is a large round open space with streets leading into it in all directions. Choose the Avenue de Choisy and keep right on, taking care to take the right hand road where you come to the forked roads (the left hand road is the Avenue d'Ivry, and would lead you to Panhard and Levassor's works). Follow the Avenue de Choisy to the Porte de Choisy, where you declare the quantity of petrol to the Octroi, and then keep right on the Avenue for some miles until you reach a round place with a statue of Rouget de Lisle, the composer of the "Marseillaise," the French national anthem. Opposite the statue turn to the left down the Rue du Pont and cross a level crossing over the railway and a bridge over the river Seine, and a few yards over the bridge turn to the right, down a little road called the Avenue de Villeneuve Saint Georges.

You have now left Choisy behind you, and you will not have much more paved road except in crossing the little town of Villeneuve Saint Georges. The road, however, is not very good, and there are two narrow bridges over branches of the river and a dirty little agglomeration of houses with narrow footpaths and children always sporting in the gutter. Just before reaching Villeneuve the road begins a steep climb, and, with a very awkward bend to the left, crosses over the railway by a bridge. Once on the other side turn sharply to the right and down a steep incline into a badly paved street in Villeneuve St. Georges. Pass right through the little town in the main street, and as you are leaving it you will come to a fork with two roads, one across the railway lines on the level and the other underneath the lines under a quaint little bridge; take the left hand road under the railway bridge and keep right on to Melun. You can "let her out" without any fear of "cannivaux" or "contraventions." Before you reach Melun you have a stretch of nearly twenty miles, through lovely country, passing through the Forest of Senart. Arriving at Melun, if you wish to stop and lunch you can do so comfortably at the Grand Monarch, where you will find petrol and oil; it is in the main street. Should you not stop at Melun you leave it on the right, and an old church nearly opposite it on the left, and keep along a short narrow street until you reach a cross street with tram lines, which you take to the right. It leads you to a bridge across the Seine, and after the bridge you keep on through the town and under a railway bridge. Just at the end of the house you come to a fork, at which you take the left

hand road and spin away to your heart's content for about seven miles or so until you plunge into the Forest of Fontainebleau and come to a little round place with a stone table in the middle of it called the "Table du Roy." Take the second turning on your right, which is a little road, rather indifferent, but which leads you into the main road some three miles further on; here turn to your left and in a very short time you are in the town of Fontainebleau, where you have the choice of hotels between the Aigle Noir and the Hotel de France et d'Angleterre. No tickets are required to visit the palace, and it will take you a couple of hours to see over it thoroughly. To visit the forest you will find plans at the hotel, and you can take your choice of routes, but you should fit out your excursion in the forest so as to finish up in the direction of Melun, and do not be persuaded to return to Paris any other way than by Melun or you will find nothing but paved roads. Should you not be sure of your way back, ask the way to Melun and not to Paris, for if you ask for Paris you will be directed to the main road, which is bad.

THE rules relating to the trials of town and suburban public service vehicles, to be held by the A.C.F. from October 5th to 10th next in Paris, have just been issued. The trials are international and are open to:—(1) Town service vehicles; and (2) Suburban service vehicles, driven by any mechanical propelling power. The awards will be based upon, (1) the net cost of running the vehicles, under the usual conditions pertaining to these types of conveyances, over a course of 60 kiloms. selected at hazard; (2) the comfort and ease of control; (3) the frequency of replenishment required, the importance of, and the ease of effecting, repairs; and (4) the cost price. Section I.—Town Service Vehicles—comprises six categories, viz.:—1.—Cabs for two or four passengers without luggage, open or closed or convertible at will. 2.—Cabs for four persons with luggage accommodation (30 kilogs. per passenger). 3.—Cabs for six persons with luggage accommodation (30 kilogs. per passenger). 4.—Delivery vans carrying a useful load from 500 to 750 kilogs., and providing a seat for a conductor. 5.—Delivery vans carrying a useful load from 300 to 500 kilogs., and providing a seat for a conductor. 6.—Tricycles carrying a useful load of not less than 100 kilogs.

SECTION II., Suburban Service Vehicles, comprises three classes, viz.:—1.—Ten-seated omnibuses with luggage accommodation (30 kilogs. per passenger). 2.—Delivery vans carrying not less than 750 kilogs., useful load, and providing a seat for a conductor. 3.—Wagons carrying not less than one ton useful load. Except tricycles, all vehicles must have a reverse and at least one double-acting brake, and a sprag. Any number of vehicles may be entered by the same maker, but duplicate vehicles of the same type and dimensions will be eliminated if the garage accommodation is not sufficient to admit them. Entrance fees up to September 15th are 200 francs per vehicle, and 300 francs from September 15th to October 1st, on which date entries finally close. The vehicles in each section will make two journeys per day over different routes.

THE number of automobilists touring through Switzerland has greatly increased of late, and the question has arisen of establishing a corps of pilots. There are so many dangerous roads in the mountainous districts that *chauffeurs* have often had to make applications for pilots. It is suggested that pilot stations shall be established at dangerous districts, where expert drivers with a full knowledge of the roads in the vicinity shall be stationed.

AFTER all, Deauville is again to have an automobile race meeting. Instead, however, of the mile trials, it is proposed to carry through a series of 500-metre runs, from a standing start and a stopping finish. Baron Pierre de Crawhez is offering a cup to the competitor who makes the best time in the trials, which are to be run off on the 10th September.

THE Automobile Club d'Avignon proposes to hold its annual hill-climb up Mount Ventoux on the 23rd September.

A **SERIOUS** campaign against the dust has been undertaken by the "Auto." It is becoming a very serious question in France, and it is in the interest of all users of the high roads as well as in the interest of all those who dwell along them to find a means of overcoming this plague. Automobilmism has not created the dust, which was just as noxious and evident on a hot summer's day with a turbulent wind, but automobilism creates wind and makes the pressure of dust constantly evident. Already a French scientist, Dr. Gugliemetti, has devoted great attention to the subject and found a means of treating the roads with tar in such a manner that the surface is protected and the dust absolutely done away with. The Association Generale Automobile has undertaken to treat the road from Paris to Versailles, which has become quite uninhabitable owing to the dust caused by the enormous numbers of motor-cars passing along it daily.

THE "Auto" has boldly undertaken the task of treating the road from Paris to Havre (136 miles), and it will call on the local authorities all along the road to lend their assistance, and will also urge all motorists to help with their subscriptions. The "Auto" concludes that if once a long road like this is rendered

be on a line 500 metres from the start, and the competitor must stop his car with the line between his four wheels. Should his car pass this line he may put in the reverse motion and come back to it, but the time will be counted against him, and should his car go more than thirty metres over the line he will be disqualified.

THE German Automobile Club has decided to allow the Daimler Motoren Gesellschaft of Cannstatt two places in the German team to defend the Gordon Bennett Cup next year. An eliminator race will have to be held for the third place, as three other German concerns have already notified their intention of building special cars for the contest, viz., Messrs. Benz and Co., Messrs. De Dietrich and Co., of Niederbronn, and the Neue Automobil Gesellschaft, of Berlin.

THE newly-formed Automobile Club of Spa is organising a series of competitions. On September 5th there will be a hill-climbing trial between Spa and Malchamps over a five kilometre course, followed by a series of mile trials from a standing start on the Malchamps Hill. A tourist circuit is to be held on September 6th between Spa,

Photo by)

A Motoring Party passing through Ightham, Kent.

(Argent Archer.

dust proof, it will be such a conclusive demonstration of the advantage that the local authorities all over France will have the work carried out without delay. The publicity given to the matter by the "Auto's" campaign, which has been followed up by leading articles in all the French papers, is already assuring the success of the attempt.

THE automobile of 1903 runs too fast for the Deauville kilometre; there is not enough room to get up speed or slow down again, so that, as I have already mentioned, it is to be replaced by a 500 metre race with a standing start. The start will be made under special conditions. A wire will be drawn across the road in front of each competing car, and after the word go, five seconds will be allowed until the car breaks the wire, which starts the chronometer; should a competitor take more than five seconds in breaking the wire the timekeeper will break it himself, and the time will be counted. The object of this is to prevent "trick starts," which the timekeepers themselves cannot prevent, and which enable some drivers to get off sometimes nearly a second before their time. The arrival will

Malchamps, Sart, and Spa, the course to be covered twice. On September 7th a series of driving competitions will be held at the Spa Velodrome, the meeting closing with a banquet.

THE Laffrey meeting was brought to a conclusion on the 11th inst. by an excursion from Grenoble to the Lauteret, a distance of 92 kilometres. The route is a hilly one, the Lauteret being 1,900 metres higher than the starting point. About twenty cars successfully made the journey, M. Pelsier on a 12-h.p. Gardner-Serpollet succeeding on the way in mounting the stiff climb up the Galibier, a rise of 600 metres in six kilometres.

THE postponed reliability trials of the Dutch Automobile Club are now to be held from the 21st to the 24th September. There are to be four daily runs from Utrecht, ranging from 145 to 190 kilometres.

WESTRUMITE, Limited, has been registered with a capital of £150,000.

SOME USEFUL NOTES.

EVERY motor using electric ignition at all times runs the risk of short circuiting the current through the insulation of the wiring breaking down, or other cause, thus rapidly discharging the accumulator and probably buckling the plates and ruining the cells, besides leaving the user stranded. To avoid this danger the neat little safety fuse illustrated herewith has lately been put on the market. It is simply inserted in the primary wiring circuit, by attaching it to either the positive or negative pole of the accumulator, and while perfectly capable of carrying a normal current to flood the coil, yet when the safety point is reached

the fuse wire breaks and severs the circuit. To fix the fuse, remove the usual locking nut from one accumulator terminal, place the eyelet holes of block and fuse over accumulator terminal, and screw down the locking nut in the usual way. Then remove small lock nut from the fuse supporting block, and connect the wire which was previously attached direct to the accumulator terminal; the fuse thus intervenes between the wire and accumulator terminal, and should a short circuit occur, it fuses at four amperes, and thus saves the accumulator from damage. Before replacing a fuse which has gone, care should be taken to locate the short circuit. The fibre supporting block and fibre with fuse have been made to fit most accumulator terminals, but where it is found, as is sometimes the case with motor-cycles, the accumulator terminals are too short to take both the supporting block and fuse, the end of the thick fibre supporting block can, if necessary, be turned on one side or cut away, and the eyelet of the thin fibre piece carrying the fuse alone placed on the accumulator terminal, the terminal screw of the thick fibre block being retained in the other eyelet, and the wire attached thereto as described above. The safety fuse, as also replacements, can be obtained from Messrs. Davies, Kent and Stewart, 17, Berners Street, London, W.

As there are several users of the old type of Panhard car, in which the brake drum is moved transversely when either the forward or backward motion of the car is used, the following hint may be useful (it once saved the rider from a bad smash). Suppose you are descending a hill and circumstances arise necessitating a stoppage. If the foot brake appears useless, place the forward and reverse lever in the forward notch, i.e., the reverse, still keeping the clutch down, and then apply the foot brake, and it may be very often found that oil on one half of the brake drum prevented it working, but when the clean half was exposed to the band the brakes acted perfectly.

IN their useful handbook the Continental Tyre Company state that more than half the tyres they receive daily for repair have become defective through insufficient inflation. This is, they state, entirely the fault of the driver who neglected to inflate the tyres properly. Let us consider what happens when slack or deflated tyres are used. The whole object of a pneumatic tyre is to support the weight acting on the rims, by means of compressed air. If, therefore, there is no compressed air in the tyre, then it is quite unfit for use, and it would be too much to expect it to do the same service as a fully inflated tyre. As stated above, it is not the tyre but the compressed air within it which carries the weight resting on the tyre. If, therefore, there is insufficient air pressure, or no pressure at all, the tyre gets jammed between the rim and the ground, and, if used in this state for any length of time, will soon be destroyed. The damage caused in this way consists in the cutting of the edges of the outer cover, or in the abrasion of the outside layer of rubber in

the place where it comes into contact with the edges of the rim and the inner-tube, which, owing to its being always nipped, gets full of numerous small holes and in time becomes quite decomposed.

MANY motorists and motor-cyclists, if their motor stops or is giving trouble, rush off at once to the nearest "motor repairer or motor expert," whereas had they only spent a few moments in looking round the various parts of the engine, etc., they would have discovered the cause of the trouble and remedied it by themselves in a few minutes. If, however, recourse must be had to a repairer, be sure that whoever is entrusted with the work has had the necessary experience, as much harm can be done to motors by unskilful repairers.

IN a perfectly new car it may be found that on disengaging the clutch to put in the low gear, the male portion may spin so much that the gear cannot be engaged; the reason of this is that the leather of the cone requires wearing down, and this may easily be accomplished by starting up the engine with the low gear already engaged, and then letting the clutch gradually in, at the same time stopping the car from moving by the hand-brake. If this is done for a few moments, the leather will be worn down nicely.

USERS of Panhard cars which have the Centaure carburettor should refrain from roughly depressing the float. As is known, the petrol is regulated by a ball valve with a delicate little spring, and a rough depression of the float will weaken the spring and cause the carburettor to flood.

SOME useful hints with regard to magneto ignition machines are given in the handbook recently issued by the Clyde Cycle and Motor Co., of Leicester, from which we take the following:—Never take the magneto to pieces or interfere with it in any way. There is nothing in the machine to get out of order. It will usually run from three to four years, when the magnets may require re-magnetising, which will cost a few shillings. Neither oil nor wet will affect the magneto. The ignition plug need never be taken out to be cleaned unless the engine has been flooded with oil, in which case the oil will work up into the combustion chamber and will flood the part where the spark should take place. In ordinary use, it will always clean itself. Should oil have got on to the ignition plug through flooding, the engine cannot be started. In this case it will be necessary to take off the ignition plug box and clean off the oil by squirting petrol on it, also letting the oil out of the engine, and turning it round a few times to blow the oil out of the combustion chamber, before replacing the ignition plug box.

WHAT is known as the Petrol Funnel has just been put on the market by Mr. E. J. Willis, of 8, Park Place, New York; it

is claimed for the funnel that it will completely separate water from petrol. It is used in the ordinary way when filling the petrol tank, the spirit passing through the filtering material, the water remaining behind. The funnel is made in two parts, as illustrated herewith, so that the filtering material can be readily replaced.

The "Hercules" Steam Wagon.

STILL another concern to take up the construction of heavy steam wagons is the Hercules Motor Wagon Co., of Levenshulme, Manchester, whose five-ton vehicle is illustrated herewith. The boiler is of the vertical fire-tube type with straight solid drawn steel tubes, suitable for either coke or coal fuel. It is 4 ft. 3 in. high and 2 ft. 3 in. in diameter; the height of the boiler above the floor line when in position is 2 ft. The outside shell can be removed for cleaning; the boiler, which is constructed for a working pressure of 200lb. per square inch and hydraulically tested to 450lb. per square inch, is dropped between the main frame, to which a patent carrier plate is firmly bolted, and is placed in rear of the front axle; the foot plate is below the main frame and the boiler is fired from the front. It is fitted with double safety valves and Klinger water gauge. The water is supplied through a water heater by means of a pump driven by an eccentric upon the compensating shaft; there are also two injectors as an auxiliary supply. The working water level is 16 inches from the top of the fire box. The engine is of the compound link-motion reversing pattern, fitted with piston valves; the cylinders are 4 in. and 7 in. diameter by 6 in. stroke. It can be converted at will from the driver's seat into a double high-pressure engine with separate exhausts, thereby giving increased power in cases of emergency. With this arrangement there is claimed to be no back pressure upon the high-pressure piston. The engine and gearing are contained in dust-proof casings and run in an oil bath. The wagon is fitted with two speeds, differential gear, and patent locking appliance. The change speed is effected by means of a special device, doing away with internal fork clutches. The power is transmitted by two strong roller chains from steel pinions upon the compensating shaft to steel chain wheels upon the triangular drive to the rear wheels. On the high gear, with the engine running at 450 revolutions per hour, a speed of six miles per hour can be attained, increasing to eight miles at 600 revolutions. No condenser is employed, the exhaust steam being superheated and cannot be seen in actual work. The front axle is divided, the steering being on a modified Ackermann principle, operated by worm and wheel, giving a large angle of lock without reducing the stability of the wagon. The

makers inform us that the vehicle can turn in a complete circle of twenty-six feet. The main frame of the wagon, which is carried upon four laminated plate springs attached to the axle by means of strap bolts, is of channel steel braced and constructed so as to carry the whole of the machinery, boiler and tank. The wheels are of the gun-carriage pattern fitted with steel hubs and bronze bushes. The front pair are 2ft. 9in. diameter with 5in. by $\frac{7}{8}$ in. tyres. The back wheels are 3ft. diameter with 6 in. by 1 in. tyres, and are fitted with a triangular drive and band brake drum whereby the drive is taken direct to the wheel felloes. The back axle is of forged steel, and is held in position by means of two strong pivoted radius rods, thereby allowing for the deflection of springs. The water tank has a capacity of 150 gallons, while sufficient fuel is carried for a run of forty miles.

At the recent Royal Lancashire Agricultural Society's Show held at Trafford Park, Manchester, a wagon of this type secured the highest award. The Hercules Company also make a five-ton tipping wagon with a cubical capacity of six yards. The engine and transmission gear is the same as in the standard five-ton vehicle illustrated, the tipping being effected by means of two screws and mitre gear operated from either side of wagon.

THE Cardiff Health Committee has recommended to the Council that two motor-wagons be ordered for use in connection with the department, at a cost of £500 each.

MESSRS. FRANK F. WELLINGTON, LTD., inform us that they have now made arrangements to supply the Brooke and any other make of car on the hire-purchase system.

THE Wolverhampton and District Automobile Club will hold a run to Buildwas to-day (Saturday), the outward journey being made *via* Madeley and the return by Wrekin.

A "TOLEDO" 24-h.p. petrol car has just been driven to the summit of Mount Washington, in the White Mountains, New Hampshire, U.S.A., a feat frequently attempted but seldom successfully accomplished. The car was driven from the Glen House to the summit, 6,300 feet above sea level, in three hours and five minutes, on the 25th ult., by Mr. A. C. Moses.

TOURING BY MOTOR-CAR.

(Concluded from page 459.)

THE driver and each passenger need one suit of good warm clothing, at any season of the year, with woollen underclothing, and of course, a top coat. The reserve suit, underclothing, toilet articles and miscellaneous belongings may go in one dress suit case, to be carried along in the vehicle, or, in special cases with a known itinerary, sent ahead by train. As a rule, however, it is better to limit one's luggage to that which can be carried. Not only will this be ordinarily sufficient, but it will obviate a good deal of worry and delay. A rain-coat and duster will both be carried as a matter of course, with an oilcloth cover for the vehicle optional, but worth while if it can conveniently be taken. The goggles, hats, caps, and other accessories used for ordinary short runs will serve very well for the tour.

The intelligent use of a motor-car for distance work on the road—which means getting the most out of it at the least expense of care and muscle, and without injury to the vehicle—

It is noticed that some automobilists get through a tour in the most comfortable and enjoyable way, while others manage to spoil their journey for themselves or others, or both. The two indispensable qualifications are tact and contrivance. One tactful person doing everything in the right way at the right time, picking up valuable bits of information from those he comes in contact with, having the faculty of securing a comfortable room at a crowded country hotel, and the like, brings enjoyment into a journey when the opposite sort of person would spoil it entirely. Happily for the whole party if the host possess this priceless disposition, for he will impart it also to his guests. The other part is contrivance—the useful faculty, for one thing, of taking along what will be needed and leaving the rest at home. Experience teaches how much to take and what, if any, to have sent on. A good bump of contrivance, aided by common sense, will bring hope out of calamity at a moment's notice. The item of luggage is only a part of it, as all the arrangements from day to day need the same happy frame of mind and spirit to carry them through with the largest amount of pleasure (and no difference of opinion worth the name.

Eugene Sandow on his "Searchmont" Car.

calls for more than a familiarity with routes and road rules—more than a close study of books of instruction in care and management. A good working knowledge, if not, indeed, a fair technical command of the principles of construction individualised in one's favourite vehicle, is essential to complete self-confidence; and this is to be gained only at the expense of considerable personal application. This sort of acquaintance not only tends to a high average of mechanical performance in the course of a tour, but it develops personal enthusiasm as nothing else could do.

One must learn to be his own mechanic as well as his own driver—at times at least—if he would not become at some time or other the unhappy victim of the village blacksmith along the great highway.

As a matter of experience, the breakdown rarely comes inside town limits, with a well-equipped repair shop within walking distance; but almost invariably half-way on the road to or from Nowhere. The right sort of knowledge, backed up by the ability to put it into practice in an emergency, means additional comfort and money saved on every long trip. An ounce of "know how" is worth a pound of profanity when the pinch comes.

From all indications, touring is being indulged in more this season than ever before. The increase in the number of motorists within the past year has been so marked that this in itself has swelled the ranks of road tourists. Apart from this, however, there seems to be a sort of universal public interest in the road performances of automobiles, and tours long and short have been planned wherever motorists meet all over the land. There exists in most men and women, along with an intuitive love of outdoor life, a genuine liking for mechanics and a penchant for travel. One of the most fascinating features to the beginner is the mowing down of the miles, and one accustomed only to the slower progress of the horse can scarcely believe that he has traversed the distance actually covered.

Anyone who wishes to get the most out of his week or two of country touring, both in health and pleasure, will find a motor-car tour superior to any other means. Nothing so completely takes the mind from business; the automobile demands and will have all the attention that is not absorbed by the scenery or circumstances of the trip; business and the ordinary cares of life are forgotten.

HERE AND THERE.

LADY GREY has just acquired a 16-h.p. Siddeley car.

TO-DAY (Saturday) the Lincolnshire Automobile Club will hold a run to Roxholme Hall, Sleaford.

DURING the month of June the exports of automobiles and parts from the United States reached a value of £33,654, as compared with £26,230 in the same month of 1902.

BARNEY OLDFIELD, who has recently made so many sensational American record times on the track, has joined the Winton Motor-car Co., for the purpose of driving the Winton racers in future contests.

MR. H. C. DIGNASSE has lately opened a depot at 5, Marshall Street, Regent Street, W., for the sale of Sunbeam and other cars. He keeps a stock of petrol and accessories as well as a number of cars for hire.

AT the Sandwich Petty Sessions, last week, the Mayor complained of the high speed at which motor-cars traversed the narrow streets of the town, and Superintendent Chaney was asked to take proceedings against offenders.

It is said that Pittsburg physicians have adopted the automobile in their practice to a greater extent than those of any other city in the United States. Nearly three-fifths of them have substituted the motor vehicle for the horse-drawn one.

AN order has been placed for an electric car for the use of the Chief of the Fire Department of San Francisco. The vehicle is to have accommodation for two persons, to be capable of a speed of a mile in three minutes, be able to climb a 20 per cent. gradient, and to possess a radius of action of forty miles.

MR. ALEXANDER WINTON, upon his return to America, is reported to have expressed his intention to abandon for the future participation in all automobile races. "I am still heart and soul interested in racing events," he declared, "but henceforth I shall design and build machines for others and will do no racing myself."

SOME of the Hythe town councillors having objected to motor-cars plying between Hythe and Folkestone, the mayor of the former town recently announced that no further licences for public service motor-cars would be granted. Much indignation is felt in Folkestone at Hythe's action, and a conference has been arranged between representatives of the two towns.

THE Fabry Automobile Company, Limited, has been registered with a capital of £5,000 to adopt an agreement with M. Fabry to buy, sell, let on hire, and generally deal in motors and motor carriages and their parts, and to carry on the business of automobile store and garage keepers, motor-car repairers, &c. The registered office is at 37, Great Marylebone-street, W.

THREE crop experts of Minneapolis, Minn., recently made a tour through Minnesota and the Dakotas examining the crop conditions. Hitherto such trips have been made with horses, and were necessarily limited. With the motor-car, however, the crop experts found they could cover a wide territory and gain a much more thorough knowledge of the crop conditions than ever before.

MR. MACONCHIE, M.P. for East Aberdeenshire, who is touring in his constituency in a motor-car, met with an accident on Saturday. The car was travelling at a rapid rate, when the lamp jumped off the bracket and was caught in the steering gear, causing the car to fall over an embankment. Mr. Maconchie, and Mr. Allen, of Lowestoft, who accompanied him, escaped with a severe shaking.

THE Mohawk Motor Company have just placed upon the market a new car called the "Mohawk Manon." The vehicle is fitted with either a De Dion or Aster governed engine, and is made in two patterns, 6-h.p. and 9-h.p. The speed of the lower powered car is estimated at thirty miles per hour, and the 9-h.p. is said to be capable of attaining forty miles. It has three speeds and reverse on one lever and three brakes—two band brakes on the back axle, and one on the differential shaft.

At the half-yearly meeting of the Taff Vale Railway last week the chairman announced that self-contained steam motor carriages were shortly to be used upon the line for carrying passengers for short distances and at frequent intervals. One advantage of the new system was that the Board of Trade had recognised the desirability of enabling carriages so moved to stop at points for setting down and taking up passengers other than stations on the railway. If the experiment was successful the new method would be applied to the carriage of goods as well as passengers.

MR. R. J. MCCRERY'S Motor Book, which has been published by Mr. John Lane in his useful series of Country Handbooks, will be of service to many motorists in their novitiate. The information imparted is of an elementary kind, the chapters dealing with the motor, change gear and transmission, driving and looking after the car, being noticeably good. The illustrations have been well selected, although the appearance of some French words near an illustration of the clutch on page 67 indicate that they have not all been specially prepared for the work. That, however, does not detract from the high opinion we have formed of the little book as a whole.

MR. B. E. DICKINSON, of the Toledo Engineering Works, Birmingham, has lately introduced the petrol saver and strainer illustrated herewith. The indiarubber tubing used is specially treated so that it will withstand the action of petrol,

alcohol and oils. As will be noted, the delivery tube is fitted with a rigid bend to hang it on or into the tank, and at the other end of this tube a strainer is fitted. The connection between the stopper and petrol can is also of specially treated rubber tubing, so that an air-tight joint may be made with the different petrol cans which are in use. The device can be supplied fitted with connections adapted for ordinary tyre pumps or for the larger motor-car tyre pumps, and is made with a 3ft. 6in. delivery tube for motor-cycles, and with 6ft. of tubing and a larger valve connection for motor-cars. Its use not only prevents waste of petrol, but obviates both the clothes and hands of motorists becoming saturated with spirit. When not in use it can be folded up into a very small space.

SPEAKING at the half-yearly meeting of the London Road, Car Co., last week, the Chairman (Mr. J. Howard Moore, J.P.) said that "six months ago I told you that during the next few months, unless anything unforeseen occurs, you will see on the streets of London several road cars driven by mechanical power. Our expectations in this respect have not been realised, for the unforeseen did occur. Various causes have contributed to this great disappointment, not the least of which was the serious conflagration at Cannstatt, in Germany, and which we are informed destroyed a number of vehicles which were in course of construction for this company. The date when these motor road cars will be seen on the streets is, therefore, deferred."

DURING his stay at Marienbad, King Edward VII. has been making use of a 20-h.p. Mercedes car.

SIR JOHN DICKSON POYNTER has just acquired a 7½-h.p. Wolseley car.

THE Imre Engineering Co., Limited, of Regent Street, W., have opened a garage at 48-50, Tottenham Street, W., where they are able to undertake all classes of automobile repairs.

ON Thursday, last week, a trial of a new motor sanitary wagon was held by Messrs. Savage Brothers, Limited, at King's Lynn, in the presence of a large number of borough surveyors.

THE British Motor Fitting Co., of John Bright Street, Birmingham, are the makers of the new two-cylinder petrol motor illustrated herewith. It is normally rated at 10-h.p., but is stated to develop 12-b.h.p. The two cylinders are cast in one

piece with a water jacket surrounding them. The cylinder diameter is 4½ in. and the stroke 5½ in., the normal speed of the engine being 900 revolutions. A governor is provided, this, as will be seen, being adapted to act on the admission of gas. The motor appears to be well designed and, with a view of long life, special attention has been paid to the bearings.

THE Scottish Office has issued to the various local authorities in Scotland copies of a set of regulations prepared by the Home Secretary dealing with the keeping and storage of petrol for the purposes of light locomotives. After setting forth the dangers which might arise from the careless storage of petroleum spirit, the circular urges the necessity of strict precautions by the employment of thoroughly sound and enclosed vessels, and by avoiding the use of naked lights in dangerous proximity to the spirit. The regulations apply only to petroleum spirit kept for the purposes and use of light locomotives, and do not apply to petroleum spirit kept for sale, or partly for sale and partly for use.

TO-DAY (Saturday) the German Automobile Club is holding a dinner in celebration of Germany's victory in the 1903 Gordon Bennett race.

THE Garage Proprietary, Limited, has been registered with a capital of £20,000 to acquire the business carried on at 34, Queen-street, E.C., as the City Garage, by Garages, Limited, and all the business of the company.

THE Automobile Agency of Dublin took back a quantity of unused spirit from visitors during the Irish automobile tour, with the result that they have been fined for storing more petrol than was allowed by the terms of their licence.

IN connection with a fire at Aberdare last week, one of the Aberdare Valley Motor Service Co.'s cars was called upon to convey a quantity of hose from the adjoining town of Aberaman to the scene of the outbreak, a distance of about two miles.

HIS Royal Highness the Rajah of Pudukota has ordered a 20-h.p. French Gardner-Serpollet steam carriage; Sir Charles Cayzer has also a 10-h.p. brougham of the same type on order from the Speedwell Co.

CONSIDERABLE excitement prevailed at Vauxhall, S.E., on Tuesday afternoon by the breakdown of a steam motor-wagon belonging to Messrs. Farmiloe, the two parts of the back axle coming apart and letting down the rear of the vehicle.

THE Motor Manufacturing Company, Limited, have lately opened a garage and stores at 34, North Street, Manchester Square, W., where any accessories for M.M.C. cars can be obtained. A staff of mechanics is now available to promptly carry out repairs.

THE Khedive, who is taking the cure at Divonne, and who had never seen Aix-les-Bains, has visited that town on his motor-car. The royal visitor left again by automobile, returning to Divonne. Very few people knew of the visit.

LAST week Mr. A. G. Perman, accompanied by a mechanic, accomplished a non-stop run from London to Glasgow on a 10-h.p. Gladiator. Although it was necessary to make a delay of 25 minutes to repair a punctured tyre, the engine was kept running the whole time the car was on the road. The route taken was via Newcastle, Berwick, and Edinburgh.

A verdict of "Accidental death" was returned at Wickford on Tuesday in the case of Mr. Daniel Harper, of Holloway-road, and 2, Russell-mansions, Russell-square, W.C., who died from injuries sustained in a motor-car accident, near Woodham Ferris, about midnight on August 7th. Mr. Harper started from Wickford in his motor-car to travel to Burnham-on-Crouch. In entering the car again after walking up a hill his left foot caught in the chain and was terribly crushed and twisted. The driver drove the car back to Wickford, where Mr. Harper was attended by a doctor. The foot was amputated on Sunday, but tetanus supervened, and death occurred on Monday. Mr. Harper had said that the accident was due to his attempt to enter the car while it was in motion.

ARRANGEMENTS are nearly completed for the course of motor-car lectures to be given next winter under the auspices of the evening institute connected with the Young Men's Christian Association, of Boston, U.S.A. The lectures will relate to the construction, care, handling and repairing of all types of steam, electric and petrol cars. There will be three courses, one, A, being intended for the owners, operators, and prospective purchasers of automobiles, giving information concerning the important points of steam, electric and petrol cars. Course B, a complete draughting course, dealing with the construction of a typical petrol car, intended to prepare machinists and draughtsmen for the automobile trade; and Course C, a practical course of steam, electrical and gas engineering, fully illustrated with engines, boilers and other equipment for the training of professional drivers.

MOTOR-CYCLING NEWS.

THE success of the Auto-Cycle Club reliability trials has been considerably marred by the bad weather which has prevailed. Out of the 48 entries, 43 faced the starter for the first day's run to Canterbury and back. The roads were heavy and slippery, notwithstanding which 36 of the riders reached the Palace at night. On Wednesday, the 12th, the run was to Brighton and back, *via* Westerham and Lewes, and on the return journey all had to climb Westerham Hill, the gradient on the worst part of which is about 1 in 7.5, and the total length about 1,076 yards. In spite of inclement weather, 35 riders turned out. Among the best performances on the hill were those of F. Applebee on a 3-h.p. Rex, A. Wright on the 2½-h.p. Ormonde, and W. Mills on a 2½-h.p. Phoenix. The run on Thursday, the 13th, was to Worthing, and proved a gala day for the police, who, by means of a trap, booked a number of the competitors for furious driving. Eastbourne was the destination of Friday's run, which was accomplished in showery weather.

ON Saturday and Sunday the riders enjoyed a well-earned rest, the trials being resumed on Monday, when thirty competitors set out for the journey to Folkestone. Brighton was visited on Tuesday, and Basingstoke on Wednesday; the trials will be brought to an end by a series of tests on the Crystal Palace track to-day (Saturday).

FOR the runs to Canterbury and Brighton on the 11th and 12th inst. the following machines, as a result of a preliminary enquiry, gained full marks:—Peugeot (one), Booth (one), Star Griffon (one), Bat (two), Ariel (one), King (one), Ormonde (three), Chase (one), Matchless (one), Alldays and Onions (one), F.N. (one), Rex (one), Bradbury (two machines).

A MOTOR-BICYCLE has just been turned out of the workshops of the Carbine Cycle and Motor Company, of Melbourne, which, according to the "Australian Cyclist," comprises many new features not seen in European or American motor-cycles. The machine has been built to the design of a well-known Melbourne motorist, Mr. H. B. James, and will be used in the forthcoming motor-cycle race from Warrnambool to Melbourne on August 22nd. The principal departure from the ordinary lines is in the frame, which is built fairly high in the front, and then sweeps down until the saddle pillar lug is only about 15 inches above the bottom chain stays, the top of the saddle being only some 33 inches from the ground. The frame provides a long wheel base—52 inches from centre to centre of wheels. The motor is a M.M.C. 2½-h.p. set vertically well forward in the frame, and is fed through a Longuemare carburettor. The transmission is by means of a flat belt 8½ feet long. The wheels are 26 inch diameter. Provision for petrol, cells, lubricating oil, coil, tools, and repair outfit is provided for in one large copper tank. The machine was built with a view of affording a comfortable touring motor machine, capable of climbing any ordinary hill without pedalling assistance, and at the same time fast, and what is of more importance, strong enough for any speed work over the average Australian roads. Trial runs around Melbourne have proved the machine to be easy of control, with a speed range of from four to thirty miles an hour. The machine weighs 195 lbs. with cells and a supply of petrol sufficient to run the motor from 130 to 150 miles.

THE motor-cycle trials organised by the Southampton Motor Club are to be held on Monday next (weather permitting), a run from Southampton to Salisbury and back twice having to be made by each competitor. The route throughout the run will be divided into sections of about twelve miles in length; an official honorary timekeeper will be stationed at the end of each section, who will note on his time sheet the hour at which each cycle passes him; marks will be deducted for a speed below twelve miles an hour over any section. If a driver shall have arrived at a compulsory stopping place in advance of his time on more than three occasions throughout the trial he will be liable to disqualification.

There will be three compulsory stops in the day, viz.:—Five minutes at the Salisbury end each journey, and half an hour at the Southampton end first return. The total number of marks for the trial is 100. Any cycle making a speed of less than twelve miles an hour over any section of the route will lose 2½ marks, while a speed of less than twelve miles an hour over two sections will entail a loss of 7½ marks. All repairs necessary during the day's run must be made by the driver himself, without any outside assistance whatever. Any replacements must be made from parts actually carried on the machine or the person of the rider. Each dismount will cause a loss of five marks, except at stops. At the latter 2½ marks will be deducted for every five minutes over the regulation time allowed. Five marks will be taken off for replacing or changing any part, such as accumulator, plug, trembler, etc. Adjustments are allowed at Southampton only; for any made on the road 2½ marks will be deducted in addition to the five for stopping. No deductions will be made for punctures, except those for the dismount to repair them. The winner will be presented with a £5 5s. silver vase given to the club by Messrs. Humber, Limited.

A MOTOR-BICYCLE hill-climbing competition, under the auspices of the Motor Cycle Union of Ireland, will be held on the hill at Ashford, Co. Wicklow, to-day. The Northern Centre of the Union is also holding a reliability trial from Belfast to Garvagh, Co. Londonderry, and back, a distance of about 150 miles. The President of the Union, the Hon. Leopold Canning, has offered four silver champagne cups, one of which will be given in each of the classes. Mr. Canning is entertaining the competitors at Garvagh Castle.

MESSRS. J. A. PRESTWICH AND COMPANY, of Tottenham, have lately introduced the automatic lubricating device for motor-cycles illustrated herewith. The pipe A projects into the oil container which Messrs. Prestwich usually fit to the front of the tank. The vacuum is maintained in the crank chamber of the engine by the patent vacuum valve which draws the oil up by pipe A through the needle valve and along the

pipe B to the motor. The number of drops per minute is regulated by the needle valve C, which when once set requires next to no attention. The glass D allows the dripping of the oil to be seen. Messrs. Prestwich inform us that they have had these lubricators running for the past fifteen months, and find that they are very economical and reliable in working.

THE Moto-Cycle Club de France has decided to organise a 1,000 kilometre reliability trial for touring motor-cycles, to be held in October next.

FROM Messrs. Thos. Noakes and Sons comes a very complete catalogue of fittings and accessories for steam and petrol cars, these including cocks, valves, unions, oil and water pumps, lubricators, and pressure gauges. We notice that Messrs. Noakes have taken up the construction of the James and Browne patent oil distributor.

CORRESPONDENCE.

THE MOTOR CARS BILL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—A very natural irritation has prevailed in the automobile world at the result of the debate on the Motor Cars Bill recently brought forward by the Government and passed through Parliament. Some automobilists seem under the impression that (1), I am the author of the Bill; (2), that the Parliamentary motorist party had it in their power at any time to stop its passage or alter it in any way they chose. Both these ideas are erroneous. The Bill was brought in by the Government on their own initiative, in consequence of a peremptory demand from the general public for more protection, which produced a feeling in the House of Commons so strong that neither this nor any other Government could have resisted.

The measure, though admittedly far from satisfactory from a motorist's point of view, is much better than might have been anticipated a fortnight ago. The Government, instead of being abused, ought to be thanked for having endeavoured, to the best of their ability, to hold the balance fairly and having resisted as far as they could the strong unreasoning anti-motorist prejudice shown by the majority of members of Parliament irrespective of party. If some Bill had not been passed this Session, the Government intended carrying through a two-clause Bill early next year, solely providing identification and increased penalties without any alteration of the speed limit at all, a proceeding which would have been very disastrous from a motorist point of view. Those who were not in the House of Commons can hardly realise the violent feeling existing against motor-cars, and on behalf of the Automobile Parliamentary Committee I may say that if every point worth fighting had not been fought for and the most strenuous opposition offered to many deleterious amendments moved from the other side, the measure would be far worse than it is.

It matters little to me how much my actions during this crisis may be either unintentionally or intentionally distorted, but in justice to the forty-five members of Parliament who did their best to protect the interests of automobilism against overwhelming odds, I think that instead of abuse they should receive the thanks of the motoring community. For nearly twenty-four hours of Parliamentary time they fought hard to improve a measure which they were unable to throw out, and the number and value of amendments accepted testifies to their labours.

My own opinion (for what it may be worth) is that the Act will not turn out to be as bad as many think, and if all motorists—amateur and professional—show proper consideration and courtesy during the next three years to the public and road user it is possible that Parliament may modify the meagreness of the speed limit, and diminish the harshness of the penalties in 1906.—Yours faithfully,

JOHN S. MONTAGU.

A NEW AIR-COOLING METHOD.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have recently secured a provisional patent in regard to the most efficient method of cooling air-cooled motors, etc. It is known that a multiplicity of points affords the most rapid radiations of heat from surfaces, and this is the principle of my method. Instead of the usual cast flange radiators, I electrically weld or cast lengths of wire on to the plain cylinder, giving it the appearance of a hairdresser's revolving brush. The wires, however, are not so closely arranged that there is any difficulty with the welding or moulding, and there is little limit to the speed of the welding operation; in fact, for a standard motor the jig could effect the welding in a few seconds. The method can be applied to cooling water jackets, as it cools more rapidly than the present honey-comb radiators and can be made much cheaper.—Yours truly,

M. R. D. ROBERTS.

THE MIESSE CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reference to the enquiry from "Faber" in the last issue of the *Motor-Car Journal*, I think my experience last week on my new 10-h.p. Miesse steam car may interest him. I had a most satisfactory run, and as I was a complete novice, never having driven a car before, I consider my tour speaks very well for the construction of the car and the simplicity of the control. We had no trouble except one short stop owing to a joint in the steam gauge leaking, due to forgetfulness on the part of the driver; this was quickly tightened. Many of the hills we met with were dangerous and precipitous. The car ran throughout extremely smoothly, and literally flew up some of the hills.

I left the works at Wolverhampton on August 2nd, at 8 a.m., with three people on board. As soon as we got through the town I took over the car and drove myself via Shrewsbury into Llangollen. After a short stop to refill tanks we ran on to Bettws-y-Coed, arriving there at 7 o'clock (a distance of about 100 miles). The next day we left Bettws-y-Coed at 10 a.m. for Barmouth via the Pass of Llanberis and Carnarvon. We stopped at Carnarvon for lunch, and then went on to Beddgelert, passing by the foot of Snowdon through Harlech along the coast to Barmouth, arriving there at 8.15 p.m. The hills in this district are very precipi-

tous, but the car tackled them all in good style. The next morning we left Barmouth about 10 a.m. for Llanurig, going via the coast, Penmaen Pool, Towyn, Aberdovey and Machynlleth, arriving at Llanurig about 7 p.m. Wednesday morning we left Llanurig at 10 a.m. for Harewood End (nine miles beyond Hereford) passing through the valley of the Wye. Thursday morning we left Harewood End at 10.30 for Gloucester by a very circuitous route, stopping at various places of interest, including a stop of two hours at Symonds Yat and Tintern. From Tintern we journeyed through Monmouth by a very hilly route to Chepstow and Gloucester, arriving at 8.15 p.m. On Friday morning we left Gloucester, passing through Taunton en route for my home in Devonshire, which we reached about 9 p.m. This was a total mileage of about 500 miles in the six days. We did not hurry in any way as we stopped to see all the places of interest on the way, and also several places of interest out of the way.—Yours truly,

A DEVON MAN.

EXPERIENCES WITH STEAM AND PETROL CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—May I add my word to that of "Faber" in last week's issue asking for reports of Miesse steam car? I should like some independent owner, i.e., one who is not interested financially in the car, to give your readers some account of the working and the difficulties to be overcome in using this type of car, also its special advantages. I am myself much interested in the Miesse, but, like "Faber," can only come across isolated reports, generally of a technical and apparently interested nature and usually contradictory. May I also suggest, that if you could arrange for similar details to be given of other good makes I think it would serve a very useful purpose. I particularly want to hear some account of the Lanchester myself. Unfortunately I am not yet the happy possessor of a car, and hence my anxiety to hear more details of various makes before deciding in which to invest.—Yours truly,

"SILENCE."

AFFILIATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I see that in a letter recently published in the *Journal*, Mr. E. Cragg, M.D., the hon. sec. of the Lincolnshire Club, mentions that some eight out of the (at least) twenty-eight motor clubs have replied. Lincoln is far and away the best place for the proposed conference, being very central and easily reached either by road or rail. Every provincial club, including the motor-cycle clubs, ought to be invited to send two delegates to a conference, and the chairman and hon. sec. of each club would be best. The question of how all the clubs could be banded together, and an effort made to work with the A.C.G.B.I. in some form should be discussed, the secretary of the A.C.G.B.I. being invited down to the conference. The famous Lincoln Guildhall would no doubt be lent for the purpose of the conference.—Yours truly,

G. J. WILKINSON.

ACCUMULATOR CHARGING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having at one time been in similar difficulty to your correspondent who signs himself "Neilage Currie," let me give him my solution of it. I purchased a Riches accumulator charging outfit, by which you can charge a car accumulator from any available installation. I charge mine from the circuit in my own house, which is a 50-volt installation. In charging cells you must have a resistance, and the lamp which is in series with the voltage in your correspondent's installation is a suitable one. When charging my car accumulator I usually connect it up at night, and it is always fully charged by morning.—Yours truly,

A COUNTRY PRACTITIONER.

MOTOR WAGONS AND ROAD WEAR.

At the Barnard Castle Police Court, last week, an important prosecution under the Light Locomotives Act was heard. Charles Hubble, the driver of a motor-wagon, plying between Cow Green and Middleton-in-Teesdale Railway Station, with barytes, was charged with driving a wagon with grooved tyres, contrary to the Act. The information was laid by Superintendent Cameron, at the instance of the Chief Constable of Durham County, and Mr. J. H. Holmes, solicitor, Barnard Castle, defended. Sergeant Nicholson said he examined the wheels on the 25th of July, and they were grooved. Wilfrid A. Young, an expert, denied that the tyres were grooved. He said the width of the wheel was twelve inches, and the plates were eight inches long. Supposing the wagon was standing on three inches of space, that would make forty-eight square inches, and thirty-six inches of that space would be solid plate, and the other twelve would be recess between the two. That recess was simply filled up with ordinary road dirt and small stones. If the tracks which the wagon made on the road were examined, it would be found that no damage to the road was sustained. There were eight rivets to each plate, with counter-sunk heads. The plates were five-eighths of an inch thick, and, always at work, would last eighteen months. The witness further stated that the wheels were all made to one pattern, and when these motor-wagons were taken off the road by the Govern-

ment Mechanical Transport Service and brought into fields and on to soft land, studs were placed in the wheels for grip. The Bench, after retirement, dismissed the summons.

THE HORSE-POWER OF PETROL MOTORS.

THE engines fitted to motor-cars are rated by some makers at powers which could only be obtained if the mean pressure during the working stroke was 120 lb. to 150 lb. per square inch. We have always had great hesitation in accepting these figures, although assured by the makers that the actual powers stated have been recorded on the brake. Even in the Korting gas-engine, where the compression is 125 lb. per square inch, and the maximum pressure about 400 lb. per square inch, the mean effective pressure on the piston is only 90 lb. per square inch. Further, the motors supplied to the North-Eastern Railway Company for their Hartlepool service, which were rated at 100-horse-power, have, it is reported, proved quite inadequate to the requirements of the traffic. These considerations all point to the conclusion that the engines fitted by some motor-car makers yield in actual fact much below their nominal horse-power. Brake trials by independent experts would, of course, settle the matter; but until authoritative figures of this kind are published we are inclined to the opinion that the actual power of a motor-car or motor-bicycle is often not much more than one-half to two-thirds of its nominal rating.

A confirmation of this opinion is afforded by some tests made by M. E. Hospitalier on a motor of a leading French maker. The object of the trials was really to test a new type of indicator specially designed for use with very small and quickly-running engines, for which indicators of the usual type are in every way unsuitable. The working agent

and was rendered unconscious. Upon subsequent examination it was discovered that her skull was fractured and most of her teeth had been knocked out or loosened. The accident also caused concussion of the brain and partial paralysis of the left side of the face.

The jury retired to consider their verdict, and upon their return into Court found a verdict for the plaintiff, with £125 damages, and judgment was given accordingly.

A FATAL ACCIDENT.

ON Saturday an old man named Joseph Manns was knocked down at Amesbury by Lord Wimborne's motor-car and killed. Captain Guest, Lord Wimborne's son, and another officer stationed at Bulford Camp, were the occupants of the car at the time of the accident. A coroner's jury on Saturday night returned a verdict of accidental death, and exonerated the driver, Frederick Long, from blame.

REFUSING TO STOP.

W. CREYKE, of Oxford, was fined £3 at Banbury last week for refusing to stop his motor-car when requested by a farmer, who was driving a restive horse, on the Oxford road. Defendant was driving at twenty-five miles an hour, and said he never saw complainant hold up his hand.

A NOVICE'S EXPERIENCE.

AT the Mansion House on Monday, Albert Tucker was charged with being drunk and driving a motor-car to the common danger in the

The Meet of the Lincolnshire Automobile Club at Skegness.

in the engine tested was carburetted alcohol; the mean pressure is stated by M. Hospitalier to have been 61.8 lb. per square inch. No doubt petrol may yield a somewhat higher mean pressure, but brake trials show that the gain is not very great. In a recent issue of the *Motor-Car Journal* we find a table giving the dimensions and nominal horse-power of a large number of motor-car engines by different leading makers. The differences are extraordinary, the maximum piston displacement allowed per nominal horse-power being nearly two and a half times as much as the smallest. The average piston displacement (reckoning out-strokes only) is 173 litres per nominal horse-power per minute, which corresponds to a mean pressure of 75 lbs. per square inch in the cylinders. With the highest rated engine the mean pressure would be 115 lb. per square inch, a figure which, for reasons stated above, we are by no means inclined to accept. M. Hospitalier, who has experimented a good deal with motors of this type, suggests that 200 litres piston displacement (out-strokes only) should be allowed per nominal horse-power, and the mean pressure corresponding to this is about 65 lb. per square inch.—"Engineering."

PERSONAL INJURIES.

AT Leeds, last week, before Mr. Justice Grantham and a special jury, the case of "Greaves v. Whitaker" was heard. This was an action to recover damages for personal injuries sustained by the plaintiff owing to the alleged negligence of the defendant in driving a motor-car. Mr. E. Tindal Atkinson, K.C., and Mr. A. P. Longstaffe appeared for the plaintiff, a lady, 54 years of age, living in Leeds; the defendant, Mr. Thomas Whitaker, of Newlay, near Leeds, being represented by Mr. Macaskie, K.C., and Mr. Bairstow. It seems that the plaintiff was, on December 27th last, crossing the Kirkstall Road, in Leeds, when she was knocked down by a motor-car, which was being driven by the defendant,

Minorities. When taken into custody prisoner said it was the first time he had ever driven a motor-car. The Alderman said the prisoner's conduct was most reprehensible, and he might have seriously injured half-a-dozen people. He would have to pay a fine of 40s. or go to prison for one month.

CLUB NEWS.

LINCOLNSHIRE.

THE Lincolnshire Automobile Club, undismayed by the ill-success of last year's meet at Skegness, when it rained heavily, had another meet at this popular resort on Saturday last, but the weather was again very unfavourable, a heavy gale having to be encountered. The strong wind, however, dried the roads, so that the going was not so bad, and a fair number of members turned up from different parts of the large county. The members met at the Pier Hotel, and "parked" their cars opposite, at the entrance to the pier. Tea was afterwards partaken of at the Pier Hotel. Some of the members stayed the week end, the others leaving at about 6 o'clock.

POLICE TRAPS.

ON the Christchurch-Lyndhurst road is a measured 220 yards; the police taking their mark from a bend in the road, and declaring that the result is accurate.

THERE are several traps on the London to Basingstoke and Salisbury roads. Near the fifty-fourth milestone at Deane Gate is a measured 200 yards with constables in plain clothes and mounted on bicycles. Another trap is at Laverstoke and Freefolk, which is worked from behind a building, and a third trap in the district is at Whitchurch, on the Andover side.

Where no alleged speed is given it is understood to be above the legal limit.

FINES amounting to £51, exclusive of costs, were inflicted on motorists at Arundel on Monday.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

VOL. V.]

LONDON, SATURDAY, AUGUST 29, 1903.

[No. 234.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

MOTORISTS must be on the look-out if they intend to steer their vehicles into a calmer haven than that in which they have been of late. Elsewhere in the present issue we print the full text of the Motor Car Act, and would suggest its serious study by every motorist. The Local Government Board have powers wider even than the 16-ft. road in respect of the closing of roadways to automobile traffic, and in Scotland there will be no appeal unless the unlucky motorist is fined £10 or more. The Act must now be accepted as one of the ills from which there is no escape, and motorists will have to make the best of a bad job.

An "Act" of Discouragement.

MR. STAPLEE FIRTH, in his letter in our correspondence columns, demurs to the statement made last week that the blame for the present unfortunate legislative position must be laid at the doors of the A.C.G.B.I., and then writes as though our reference was solely confined to the speed limit. We recognise that the Club was sound on this latter point—sounder even than its Parliamentary champions. What we did say was that in fostering the earlier agitation for legislation the Club was unnecessarily bringing the question to the front. Had motorists lain low the matter would probably have been postponed for a season.

The 16 feet Clause.

It is dawning upon motorists generally that one of the worst clauses of the Motor Car Act is, as we pointed out two weeks ago, that which gives the Local Government Board power to close any roads of a width less than 16 ft. to motor-cars. This may prove an inconvenience and hardship to motorists on tour, prohibiting them from many of the most delightful spots in the country, and, in fact, closing half the land from their vision. Of course, everything depends on the view taken of the matter by the central authorities. We hope they will interpret their duties in a liberal and reasonable spirit; but a note of warning is necessary to motorists to be exceptionally careful during the next few months, so that the wrath of local authorities may not be aroused and the central office incited to the closure of roads unnecessarily.

The Ten Miles Limit.

THE Public Control Committee of the London County Council is being asked to receive a deputation from the automobile trade with regard to the suggested restriction of the speed of motor-cars in the County of London to ten miles per hour. Other vehicles are allowed greater latitude in this respect. As has been conclusively demonstrated, the power of control over motor-vehicles is so absolute that at the (maximum legal) speed of twenty miles per hour, where traffic permits, they are more under control and less dangerous than horse-drawn vehicles at twelve miles per hour, which speed is

often exceeded even in so frequented a thoroughfare as Victoria Street, Westminster, in the middle of the day. It is impossible for either the driver or an observer to estimate exactly the speed of a vehicle, so that in effect, in order to avoid incurring the danger of the heavy penalties imposed for a technical breach of this speed regulation, motor-vehicles would be compelled to proceed so slowly as to frequently become an absolute obstruction. At slow speeds, too, the noise is greatly increased. These and other points have already been brought to the notice of the Council, and it is to be hoped that its Public Control Committee will receive the proposed deputation.

Legal Police Tactics.

THE pronouncement of the Attorney General in the recent debate on the Motor-Cars Act that it was illegal for a constable in private clothes to attempt to stop automobilists, has resulted in the presence of the constables now being on duty in their uniforms. In a ride to Frensham, last week-end, constables were largely in evidence, and very miserable they looked, stationary on point duty. At Ripley there were two, one at each end of the village, and they were very conspicuous with their white gloves. On the Fair Mile there was one in the centre and so all along the route, but we understand very few captures were made. The ride to Frensham is a charming one and can be varied almost indefinitely. The roads were a trifle dusty and the views over Merrow Downs were very lovely, the hills standing out sharp and clear, a sign of rain in the near future. At Frensham there is the Pond Hotel, a very comfortable place, while at the Hut Hotel, Wisley, belonging to the Surrey Public House Trust, first-class accommodation at reasonable charges can always be depended upon. It is a charming "pull up" here, and facing the lake, it is interesting to sit and watch the numerous motor-cyclists and cars pass.

An Artist Motorist.

ON another page we reproduce an interesting photograph of the well-known artist, Professor Hubert von Herkomer, on his 10-h.p. Panhard, taken outside his house at Bushey. The Professor, who is a member of the A.C.G.B.I. and the German and Bavarian Automobile Clubs, is at present holidaying in Bavaria, and writes that "Although many of the roads leave much to be desired, Southern Bavaria is a glorious country for motoring. The people are friendly, and good inns are everywhere."

The Herkomer Touring Competition Trophy.

NEEDLESS to say Professor Herkomer is an enthusiastic motorist, and has just given a noteworthy proof of this by offering, through Professor Poehlmann, the President, to give a trophy of the value of £500 to the Bavarian Club under somewhat the same conditions as Mr. J. Gordon Bennett presented his now famous cup to the A.C.F. There is this difference, however, that while the Gordon Bennett cup is for a race, the "Herkomer prize of the Bavarian Automobile Club," as it is to be known, is for an international competition of touring cars, the details of which have yet to be arranged.

Park Regulations in Glasgow.

THE Parks Committee have recommended the Glasgow Corporation to make the following by-law regulating the use of motor vehicles in the parks, the penalty for contravention being £5 for each offence:—Except on the public streets in Glasgow Green, known as King's Drive and King's Bridge, no vehicle of any description propelled by steam, gas, oil, electricity, or other mechanical power, shall be used or driven in any park (including Glasgow Green), recreation ground, or open space, except on the roads marked as carriage drives, and on these only between sunrise (or in the case of parks the carriage-drive gates of which are closed at night and not open till after sunrise, the opening of these gates in the morning) and 2 p.m., and no such vehicle shall be used or driven on any portion of any carriage drive oftener than once in 15 minutes. The speed must not exceed eight miles an hour. Alarm bells or other means of giving audible and sufficient warning of the approach or position of the vehicle must be used when necessary to prevent risk or accident. In foggy or dark weather the vehicles must also be provided with efficient lights. The vehicles must be either hackney, job, or private carriages.

Capt. J. A. Cole, Chairman of the Lincolnshire Automobile Club.

Motors v. Horses.

MESSRS. McNAMARA AND CO., who are the Post Office contractors for London, are trying an experiment with a motor-van, and according to the chairman at the meeting of the shareholders just held, it has so far proved satisfactory. They must, however, have an extended trial under the varying climatic influences of this country before they will express an opinion as to the practicability of utilising motors for this purpose on an extensive scale. The points they have principally to consider are reliability and cost of working and maintenance. Whatever be the result of this experiment, they will have gained knowledge and experience which the directors will be able to turn to account to meet the wishes of customers requiring motors in place of horse-drawn vans. But the cheapest form of traction for a free vehicle is the horse, according to this authority.

The Useful 'Bus.

REFERRING to the various forms of vehicles as affecting a solution of the traffic problem, the chairman of the London General Omnibus Company (Alderman J. Pound) has just told the shareholders of that concern that no other form of street traction was known which in practice would carry such vast numbers of passengers with so little congestion as an omnibus. Considerably over a million people were carried every day by London omnibuses, and any point of congestion of traffic where the public was served would show to an impartial man the fact that the vehicle which actually carried the largest number of passengers to the least hindrance of other traffic was the much maligned omnibus. As to whether the London omnibus was going to remain a horsedrawn vehicle, he could not say. At present, motor-omnibuses had been delivered to them, and, while the authorities were deciding if they would license them, the company was testing them in various ways. With regard to motors, the two main points to consider were safety and economy of working. At the present time the company's position was such that they could profitably adopt motors, but they must first be satisfied that motors would carry the public safely, and would be worked at least as economically as their present vehicles.

Litter on the Highway.

A CASE of interest to motorists has been heard at Wilmslow, a Warford farmer being summoned under the Cheshire Council's new by-law respecting hedge cuttings on the highway. The police found that cuttings likely to cause annoyance and danger to users of the road had been left for a longer period than one hour after sunset. Defendant was fined 5s. We welcome such action on the part of the police, not in any vindictive spirit, but as proving to the public that the hedges and lanes of the country must be kept in order. Heaps of stones are frequently left in dangerous places on the highway by road menders, and a campaign in that direction would also be of service to users of the road.

Trees and the Width of Roads.

A SOMEWHAT similar question arose at the quarterly meeting of the Roads and Bridges Committee of the East Suffolk County Council. There has been alleged obstruction of the main road from Lowestoft to Beccles by trees on the Hon. A. J. Mulholland's estate, the clerk reporting that there were two oak trees in a live fence. The average width of the road was 24 ft., and in one case a tree reduced the width to 20 ft., and in the other to 22 ft. The Chairman said he understood that these two trees had been removed. The surveyor said he was unaware of it. Mr. Mobbs remarked that there had been a tree or two cut down. The surveyor was instructed to view the spot again and report. In view of the new legislation this reduction of the width of the highway by trees is a serious matter to motorists.

Another Royal Motorist.

ONE by one the crowned heads of Europe are joining the ranks of automobilists. Hitherto motoring has made relatively small progress in Portugal, but now that the King has entered the ranks of motorists a great impetus is likely to be given to the movement in that country. Dom Carlos's choice has fallen on a 15-h.p. C.G.V. car, of which we give an illustration on another page of the present issue. Messrs. Evart-Hall, the English agents, inform us that the vehicle is one of the new 15-h.p. cars, with four steel cylinders and mechanical inlet valves, and is the first one of the type delivered. The chassis, which is extra long, is fitted with a special touring body designed and built by Messrs. Muhlbacher, of Paris, and seating eight persons. It is beautifully upholstered in dark tufted leather, fitted with glass wind shields and curtains. A feature of the body are the two revolving seats in the side; these run on ball bearings, and persons seated in them can

either face towards the front of the car or turn round and converse with persons seated in the back of the vehicle.

Motor Hansoms.

THE motor-hansom shown in the illustration on page 501 is one of those to be shortly placed on the streets of London by the London Express Motor Service, Ltd. The driver sits in advance of the passengers, but somewhat lower and to one side, so that their view is not obstructed. The dimensions of the cab itself are somewhat larger than in the ordinary hansom, while an additional folding seat is fixed alongside the driver which can be adjusted and used for a third passenger when required. The glass front is fixed with a spring attachment, and can be operated by the passenger. A distance indicator is placed inside the cab, so that the fare can see precisely the distance travelled. Luggage in the shape of portmanteaux can be carried in the boot at the rear of the body and under the seat. The engines used are 12-h.p. double cylinder Aster, governed and slow running, the power is transmitted through a Panhard type of gear to a cardan driven axle.

Cab and Motor.

At Llandudno two cases have just been heard on the same day which reveal such an unusual state of affairs that it deserves comment. A cab driver was charged with furious driving to the public danger. He was fined 20s. and costs. The next case heard at the same court was that of a motor-car driver summoned for a similar offence. He was fined 10s. and costs. Evidently the Welsh magistrates recognise the proportion of things.

The Midland Hill Climb.

At length the official result of the hill climbing competition organised by the Midland Automobile Club on Sun Rising Hill is to hand, and Mr. Cecil Edge has been awarded the President's Cup. The next four places were taken by Messrs. J. V. Pugh, A. Millership, A. E. Crowdy, and G. Iden respectively. Some discussion has arisen with regard to the formula adopted in connection with the event, and the letter

One of the Great Western Railway Company's Public Service Cars leaving Helston for the Lizard. There are two cars on the service; they can each accommodate twenty-two passengers, and are of the standard 16-h.p. four-cylinder Milnes-Daimler type. (Photo by) (Gilson & Sons, Penzance.)

Great care has been exercised in the distribution of the weight, in order to reduce any tendency of side slip to a minimum. The vehicles are geared low, to give hill-climbing power, and to remove the possibility of an excess of speed on the part of the drivers; the limit of speed being about twenty-six miles an hour on the level.

At an Agricultural Show.

THE gymkhana held under the auspices of the Yorkshire Club and the Horsforth Agricultural Society on Monday proved a sorry spectacle for horse breeders, and that an agricultural society should have had to enlist the services of automobiles to draw a crowd must have made the farmers weep. Unfortunately the elements were watery, with the result that interest in the competitions was dampened considerably. Perhaps the most interesting contest was that in which the prizes went to those who drove at the slowest speed without actually stopping their cars. Mr. A. Farnell was the last competitor to reach the finishing post with a 5-h.p. Oldsmobile, and was awarded the first prize, Mr. W. R. Booth being second with a 6-h.p. Prunel. The North of England Motor Company won the bending race for motor-carriages, with Mr. W. R. Booth next.

from Mr. T. C. Aveling on another page opens up an interesting question.

An Early Steam Car.

THE credit of having produced in the early part of last century a steam coach, excelling in commodiousness and luxuriousness the horse-drawn stage coaches and travelling carriages of the time, is due, it would appear, to a Mr. W. H. James, who, in conjunction with Sir James Anderson, Bart., constructed and ran about 1829 the road coach illustrated on page 498. This commodious vehicle was driven by two separate engines, each comprising a pair of horizontal cylinders, one engine being allotted to the near side driving wheel, and the other to the off side, the axle being made in two distinct portions. Indeed, it was a twin-carriage both in regard to engine and boiler, the advantages of which were demonstrated on one occasion when, in running through Epping Forest, one of the boiler tubes—which were nothing more nor less than ordinary gas pipes—split, and put out one of the fires; with the remaining boiler and engine the carriage returned home at the rate of seven miles an hour, carrying a load of more than twenty passengers. It was a very heavy and substantially built vehicle, weighing, with its complement of passengers, something like seven tons.

The G.N.R. Converted.

THE Great Northern Railway Company is the latest of the British railways to recognise the value of the motor-car on a track. A car of standard gauge is now being constructed from the designs of Mr. J. D. Roots to carry thirty passengers. It will be propelled by a Roots oil engine of 40-h.p., and there will be four speeds in either direction. A cab will be provided at each end for the driver, so that the car may be driven at either end. In the first car the top speed will not be high; as a matter of fact, about 35 miles an hour. The ordinary petroleum oil, paraffin, or kerosine will be used, as in the Roots engines for road vehicles. The engines and the rest of the propelling mechanism will be manufactured by Messrs. Sir W. G. Armstrong, Whitworth and Company, Ltd.

Mails by Motor.

THE election in Argyllshire has again drawn attention to the varied merits of the automobile. The Liberal candidate relied to a great extent on his motor-car in canvassing the constituency. Occasionally he was able to render assistance to others, notably when the Clachan mail coach stuck in the mud. By Mr. Ainsworth's good nature the mails were transferred to the motor-car, together with several passengers, and they were conveyed to Tarbert. For once the mails reached Tarbert in advance of schedule time.

Canals for Automobiles.

THE suggestion that motor roads should be provided for motorists has led a correspondent of the London "Echo" to recommend that the canals should be drained and adapted for the purpose of automobile traffic. The railway companies and the location of the canals are two difficulties in the way of the actual operation of the idea, which has little to commend it. Among practical men the idea of specially constructed motor roads does not appear very attractive, and Sir Fortescue Flannery, M.P., is the only one of a dozen M.P.'s who has written to our contemporary in support of the scheme. Even he gives a guarded approval of the plan, and does not think that at present there are sufficient motors in existence to justify the establishment of special roads.

No Escape from License Fees.

THE new legislation will prove of utility to the revenue authorities, and from the list of registrations the latter will be able to ascertain the owners of cars. The result will be that few will escape the payment of licenses. Recent regulations in the United States have given English automobilists a foretaste of what may happen here. Fully two thousand New Yorkers own New Jersey licenses for automobiles. As these vehicles represent an average of fifteen hundred dollars each, the Secretary of State called attention to the fact that assessors of personal property had not taken advantage of the records in his office to get names and addresses of automobile owners, so as to assess these amounts in their personality. Till then no assessors excepting the Board of East Orange had thought of this method of increasing the rateable value. These assessors went to Trenton recently and secured the names of every automobile owner located in that municipality, and, as the affidavits attached to application for licence disclose the value of the cars, it was a very easy matter to make correct assessments.

Oil on Roads.

It is generally agreed that the reason some roads treated with oil have turned out well and others ill is due to the differing bases of oils. The "San Francisco Chronicle," with the experience of California roads in view, says:—The crude oil used on the London and Aldershot road proves to have had a paraffin base, which in itself explains the cause of its failure. Everything depends upon the base of the oil used. If

paraffin is the base nothing but failure can be expected, for when the volatile substances contained in the crude petroleum evaporate the residuum left is a brittle, greasy substance, which affords absolutely no protection to the roadway. The secret of the success of the oil treatment of roads in California lies in the fact that American crude petroleum possesses an asphalt base, which leaves an asphalt covering on the surface of the roadway after the volatile elements have been evaporated by solar action. This asphalt covering is as complete a protection to the roadway as if its surface were paved with a coating of bituminous rock. And every successive oiling received in the treatment thickens the asphalt shield of the crown of the road, more thoroughly protecting the underlying foundation from the action of water, let it rain ever so hard.

Fines on Motorists.

DURING the month of August we have recorded no less than 399 cases of alleged furious driving of automobiles, 343 relating to motor-cars, and 56 to motor-cycles. Of these eighteen of the former and three of the latter were dismissed, while one was withdrawn by the police. The total amount of fines imposed was £1,487 9s.—a substantial gain to the county funds. The average fine imposed upon drivers of cars was £4 5s. 6d., and upon riders of motor-cycles £1 15s.—a fairly heavy addition to the ordinary expenses of automobilism. Even the amounts thus totalled do not represent all the cases heard at the courts, but only those of which we have been able to obtain prompt and authentic particulars and find space for their publication. When the new Motor-Car Act comes into operation at the beginning of next year the county funds will be largely augmented, for the great majority of the fines at present imposed are in cases when the drivers have been alleged to have only exceeded the new legal limit by a few miles.

An American Endurance Trial.

THE most thorough endurance test of automobiles ever held in America will take place in October over roads from New York to Pittsburg, and under the auspices of the National Association of Automobile Manufacturers. The classification of the vehicles will be according to selling price instead of by weight as formerly. The contest will not be one of speed, it being the aim to make the run as nearly as possible under ordinary touring conditions. Only standard motor vehicles of stock pattern, regularly catalogued and offered for sale, will be admitted to the test. Six thousand points will be the maximum score. Every stop en route will be penalised at the rate of one point for each minute lost excepting those stops called for by the schedule and those required by the law or for the safety of persons in the road. One thousand points will be awarded for weight, and every vehicle to attain it must carry 30 per cent. of its own weight. Points will also be awarded on the following basis:—The condition of each competing car at the finish of the test. The cost of repairs to each car and the time required to make them. The efficiency of brakes. The hill-climbing capacity of each car.

ON Tuesday Mr. Albert House held a sale of motor-cars on the premises of the Bradford Motor-Car Company.

THE Firefly Motor Co. have arranged an auction sale of motor-cars and accessories at their garage, at Croydon, for the 5th prox.

MESSRS. B. THOMPSON AND COMPANY, of Frome, are introducing a four-seated 9-h.p. "West Country" car. One, built to the order of Mr. Walter Case, has just made a trial trip to Cheddar and back again to Frome in good style. It is now nearly four years since Messrs. Thompson and Company became identified with the motor-car industry.

IN the Legislative Assembly of New South Wales the adjournment of the House was recently moved by Mr. E. M. Clark, in order to call attention to the "present unsatisfactory administration and control of the metropolitan street traffic."

THE TOTTENHAM MOTOR CHEMICAL FIRE ENGINE.

THE new Motor Fire Station and Depot at Tottenham, which was opened on June 25th, does not mark an era in the Fire Brigade in Tottenham, being merely an extension of the District Council's excellent brigade, owing to the enormously increased population. The brigade was taken over by the Council about ten and a half years ago, prior to which it was purely a voluntary brigade on the most primitive basis. The inhabitants of Tottenham may congratulate themselves upon the fact that it is now amongst the best equipped and one of the most efficient in the kingdom. The oil-fuel motor steam fire engine which has been placed in the station is one of the "Fire King" pattern, built by Messrs. Merryweather and Sons. It is fired by means of vaporised oil, and is capable of pumping three hundred and twenty gallons of water per minute. Standing in the

ing a hose tender, chemical fire engine, fire escape and motor in one car. The vehicle has been designed for the special purpose of combining all the latest and most scientific improvements intended to save life or extinguish fire. It is fitted with a 20-h.p. petrol motor and with a change speed gear giving three speeds, viz., fifteen, ten and six miles per hour, and a reverse at the latter speed. Specially designed fittings are provided for shipping and unshipping the 50 ft. sliding carriage telescopic escape in a few seconds. The ladders are trussed with steel tubes up each side, thus ensuring a maximum amount of strength with a minimum of weight. By an ingenious device the same hoisting gear and winch which wind up the sliding carriage are used to extend the ladders. The chemical cylinder is of polished copper with gunmetal fittings. It holds sixty gallons, and is fitted with acid bottle and patent apparatus for mixing the liquids. A brass reel carries one hundred and eighty feet of hose for the discharge of the chemical fluid. The hose tender carries three hundred feet of hose. The machine is designed to carry six men besides the driver. It

The New Motor Chemical Engine and Fire Escape.

fire station the engine will be kept, by means of a gas jet, with about five pounds of steam always in the boiler, and on a call being received the vaporised oil can be at once ignited, and in less than a minute and a half it can leave the station to respond to the call. Any speed up to thirty miles an hour can be obtained. On arrival at a fire the driving machinery can be easily thrown out of gear and the pumps put on, so that by the time the hose has been run out and the branchman is ready the engine can immediately commence pumping. The fire can be regulated at will by the engineer, who has it under complete control. The engine carries two cylinders containing thirty-six gallons of oil, or sufficient to last at an ordinary fire for several hours. Two tanks are fitted, one on each side of the boiler, for the storage of water, and a main feed pump works all the time the engine is travelling. There is also an injector placed in a convenient position in case the main feed should at any time fail. The combined motor chemical fire engine, hose tender and fire escape illustrated herewith has also been built by Messrs. Merryweather under the supervision and direction of Superintendent Eddington, of Tottenham, who originated the idea of combin-

may be mentioned that there are no horses kept for Fire Brigade purposes at this station, the stabling provided being for the horses used in road-cleaning, watering, &c., for the Tottenham Council. After the formal opening of the station, trials were made of the new motor fire appliances, which turned out in 20 seconds from a test call, and after a short run both the chemical engine and the steamer were got to work with various jets, and the use of the fire escape for saving life was also demonstrated to the entire satisfaction of those who witnessed it.

THE Neue Automobil Gesellschaft, of Berlin, is reported to have secured an order for six 10-h.p. public service vehicles for Pietermaritzburg, South Africa.

WITH the view of encouraging the use of electrical motor vehicles, the Edison Electric Illuminating Company, of Boston, U.S.A., is preparing a guide which will contain a road map, showing the best routes from point to point, with a list of all accumulator charging stations within a radius of twenty-five miles from Boston.

THE "CLYDE" LIGHT CAR.

—X—

WE are this week able to give an illustration and a brief description of the latest type of two-seated petrol car made by the Clyde Cycle and Motor Car Co., Ltd., of Leicester. The motive power is supplied by an Aster 6½-h.p. single-cylinder engine, set under a bonnet in the fore part of the frame. The cylinder cooling is effected by pump and radiator, while the usual form of high-tension ignition is adopted. The engine is equipped with a governor acting on the inlet, in conjunction with which is a pedal-operated "accelerator." The motor is so arranged that when the bonnet is raised the valves, pump, commutator, etc., can be examined and adjusted without difficulty. It is started from the right-hand side by a handle at the side of the bonnet. It can easily be started by a lady. The power is conveyed through gear wheels and Renold's silent chain, running on shafts parallel with the rear axle. Ball bearings are fitted to both axles and also to the countershaft, so that there is a minimum loss of power through friction. In addition to a reverse, two forward speeds are provided, which, with the motor running at its maximum rate, gives nine and thirty-seven miles per hour. Any other speed can be obtained down to four miles per hour, by means of the ignition and the governor. Gear changing is effected by a lever at the

side of the car, which is so placed that it does not interfere with free ingress and egress from the vehicle. The friction clutch is made with metal faces. The car is controlled by two pedal levers, one of which actuates the friction clutch, and the other puts on a band brake on a large drum on the countershaft. For emergency, or for holding the car stationary when the driver is out, two back wheel brakes are provided, worked by a lever at the side of the driver. The road wheels are 26 in. diameter, shod with pneumatic tyres. The dimensions of the car are, width over all, 4 ft. 6 in.; length over all, 8 ft. 2 in. The petrol tank is fixed at the rear of the dashboard and holds 2½ gallons. We are informed that the car illustrated has run 105 miles on a consumption of two gallons of petrol.

WE hear that Lord Northampton has placed an order for a Duryea car.

TO-DAY (Saturday) the Kent Automobile Club will hold a hill-climbing competition at Wrotham.

FINDLAY'S CARRIAGE, WAGON, AND MOTOR WORKS COMPANY, LIMITED, has been registered with a capital of £3,500, and registered offices at 190, Great Brunswick Street, Dublin.

CONTINENTAL NOTES.

By "AUTOMAN."

—X—

IN order to reduce the weight, and therefore increase the speed, it has become the custom in kilometre races to take off the brakes and all other parts which can be dispensed with for such a short run. I have even known of the radiator and water tank being taken off, the motor being run for a record kilometre without any cooling arrangements whatever. The competition at Deauville will preclude any such performances, for the engine must not be stopped at the end of the race, but the car must be ready to move off again on the order being given by the judge, nor must the tyres be torn or injured by a too sudden stop. The car must be in good condition in every way after the race. The Baron Piere de Crawhez has offered an £80 cup in connection with the race for the car weighing between 650 and 1,000 kilos. which makes the best time in the speed trials.

THE committee of the German Automobile Club have begun to seriously consider the organisation of the Gordon Bennett race for 1904. It is pretty nearly settled that the race will be run to the north-west of Berlin, in the Grand Duchy of Mecklenburg, where there are magnificent roads through country where the population is very meagre, and where there are few villages on the main roads.

THE summer (if such a title can be given to the series of cold deluges of rain we have had for the last two months) is rapidly passing away, and the latest sign of its recess is the shutting down of the balloon experiences of the Lebaudys. The famous air ship "La Jaune" has been deflated definitely, and the aeronauts are about to set to work on a new model, full of improvements, for 1904.

THE Automobile Club of Avignon proposes to hold a hill-climbing trial at Mont Ventoux between the 20th and 27th of September next. Mont Ventoux is for many reasons an ideal hill for a competition, and quite suitable for becoming the site of the world's championship in motor hill climbing. In the first instance the climb is a long one and covers 21 kilometres (13 miles) of hills averaging 8 per cent. of slope, and with gradients of as much as 13 per cent. One most important feature is that the road leads to nowhere except the summit, where there is a hostelry, and thus the traffic can be completely suspended without interfering with anyone; the sole traffic consists of the 'bus belonging to the hotel.

FROM the Transvaal to the Littoral is a long cry, and the change of scene, of food, of climate, and above all of roads, must be striking to Captain Walker, of the Engineers, who, after spending four years in South Africa, is passing some portion of his well-earned leave in an automobile tour through Europe. His car is well fitted out for all eventualities, down even to a big waterproof sheet fitting over the whole car, and meant to act as a tent in case of emergency.

THE Criterium of one quarter of a litre for motor-cycles is to be held at the Velodrome at the Parc des Princes, over a distance of 100 kilometres, between the 14th and 20th of September. The event is open to any machine whose cylinder or cylinders have a total capacity which does not exceed 250 cubic centimetres, that is to say, one twentieth of a gallon, or nearly half a pint. The capacity is to be calculated according to the volume displaced by one complete stroke of the piston or pistons. No pedalling is to be allowed, and no means of propulsion save the motor; at the same time the competitors may be pushed to start them or to restart them during the race. There will be a double classification—that is to say, individual and by series of three.

CHANTILLY is 63 kilometres (39 miles) from Paris, and a good road out is from the Place de la Concorde to the Rue Royale up to the church of the Madeleine, and then turn to the left in front of the steps of the church and take the Boulevard Malesherbes. Follow it until you are right in front of the church of St. Augustin. Cross over this wide square with the church on the left hand side and a railed-in public garden on the right and turn sharp round to the right at the far side of the garden into a little wood-paved street, the Place de Laborde, which in fifty yards leads to the Rue de Vienne, paved with setts. Here turn sharp to the left up hill and keep on in a straight line across the Place de l'Europe, which is an immense bridge over the railway lines coming out of the Gare St. Lazare. Across the Place de l'Europe in a direct line, take the Rue de Saint Petersburg, still uphill, and into the Place Clichy, which must be crossed nearly opposite the Avenue de Clichy, which is followed right on to the Porte de Clichy, where petrol must be declared to the Octroi. After passing through the gates take the Boulevard National and follow it through Clichy to the River Seine, which is crossed on two bridges. Then in Asnieres take the Rue de Paris into Gennevilliers and continue right on to Epinay, where the

banquet in honour of Germany's success in winning the Gordon Bennett cup, among those present being the Duke Adolphe Frederic of Mecklenburg, Herr Moeller, the Minister of Commerce, the Count de Talleyrand-Perigord, and M. Jenatzy.

THE new clubhouse of the Russian Automobile Club in St. Petersburg was inaugurated on the 8th inst. It is located at No. 30, Galernaja, and comprises a garage and repair shop, which has been put in charge of a French expert.

THE first lady motorist in Berlin presented herself to be examined by an expert as to her capabilities in driving a motor-car through crowded streets, etc., on the 18th inst., and received the police certificate for efficiency.

A RUMOUR is current in Paris that an English syndicate has contracted for the whole output of the new type of Leon Bollée car during the next three years.

MOTOR-CARS are to be largely used in the forthcoming Italian military manoeuvres. A number of cars are to be placed at the

The King of Portugal's 15-h.p. C.G.V. Car. (See page 490.)

country begins. At Epinay ask the way to Engien, and when in front of the lake at Engien take the first turn to the left past the Casino, down a bad road and under a railway bridge. Ask for Soisy, from whence inquire for Montlignon. After passing right through the long winding street in this pretty village, a long climb is made through a lovely wood and down a hill on the other side, with winding, wonderful turns, on to a plain, which is crossed. Under a railway bridge and on to Moiselles, a tiny village, where a sharp turn to the left for about a mile or so brings the traveller to a corner on the worst *pavee* I have ever crossed. Then take the right hand turn towards Viarmes, which is marked on the signpost of a house at the bad corner. On the road to Viarmes is the pretty village of Belloy on the right. Do not pass through it but go straight on down a very steep hill and under a railway bridge into Viarmes, where the route is through the main street, past the church, and on to Royaumont and through the hamlet of Le Lys, where is the forest of the same name. A few miles further on are cross roads, where the right hand road is taken to Gouvieux. In Gouvieux ask the way to Chantilly, which is only a few miles away.

disposal of the principal officers, and it is anticipated that they will prove very valuable in enabling them to keep in close touch with all points of the manoeuvres. It is also announced that the King of Italy will follow the manoeuvres in his motor-car.

THE Minneapolis Automobile Club has inaugurated a new method of calling attention to abuses in the operation of motor-cars. In future bulletins will be issued from time to time, citing instances of careless driving, without giving the names of the offenders. It is believed that this will impress chauffeurs with the importance of exercising care in operating their vehicles. Occasional Bulletin No. 1, just issued, reads as follows:—This sheet will be issued by the Automobile Club of Minneapolis whenever material accumulates, the dissemination of which would tend to place automobiling on a better basis. Inasmuch as all Minneapolis automobile owners are not members of this organization the widest publicity will be given the information, in the hope of preventing abuses and of enlisting the co-operation of all for the wise protection of all interests. It is believed that the mere mention of some abuse will be the surest method of stopping it, especially as no cases will be cited in these bulletins which are not based upon specific complaints.

ON Saturday last the German Automobile Club held a

SOME USEFUL NOTES.

It may happen that in lubricating the mechanism or wheels, some of the oil may drop on the tyres, in which case it is necessary to clean them immediately. Though perfectly waterproof, rubber is easily affected by oil or acids, and, if exposed to their action for any length of time, soon becomes totally destroyed. The Continental Co. inform us that it is not always possible to repair covers decomposed by oil; it all depends how far the decomposition has advanced. It is therefore in the interest of the driver himself to take good care that oil or acid does not come in contact with the tyres.

HEREWITH we illustrate two useful little accessories which have recently been introduced by Messrs. Salsbury and Son, Limited. The first is the "Tydee" tray oiler, which, as will be

seen, is a handy and neat fixing made to attach to the dashboard under the engine bonnet; it consists of a tray of such a design that it holds the largely used force-feed oil can securely in position when not in use. The second illustration shows the "Tydee" waste tray; this is made to fit underneath the bonnet in any

convenient position, and is a very handy receptacle for carrying cotton waste, oil rags, etc., used by the mechanic; it obviates these having to be carried anywhere about the car where they would be likely to damage the upholstery or fittings, and ensures them always being to hand when wanted.

SOME gear-boxes are made in which the wheels that move (the sliding sleeve) are the larger ones, that is, the driven shaft and not the driving or clutch shaft; with this type of gear difficulty may be experienced in coming back from third speed to second, and second to first, but it may be easily overcome in the following way: Depress the clutch at the change, and as soon as the wheels touch, let the clutch in, at the same time pulling the speed lever into position. The change will then be effected without any difficulty.

THERE is often considerable doubt as to how the firing cam should be set, so the following simple method may be useful to note. Place the advance spark lever in the centre of its rack, and when it is in this position, the cam should be set to fire when the piston is just at the top of the compression stroke. This method gives an equal range of firing, both before the dead centre and over the dead centre. It will be found that engines vary, according to whether they are high-speed or low-speed engines, and in the case of a high-speed engine, the method above described may be found to set the firing a little late. With a high-speed engine, to set the cam, it is best to place the advance spark lever three-quarters of its rack towards late firing, and then set the cam to fire when the piston is at the top of the compression stroke.

USERS of four-cylinder engines should note that it is not necessary to turn the engine round to get any particular

cylinder on contact. All that is necessary is to connect the commutator brush of the required cylinder to the frame, and contact is made.

To facilitate the setting of the firing and the valves, the flywheels of most four-cylinder engines are marked in the following way. Suppose we turn the flywheel round until the marks are at the top (i.e., in a vertical line with the ground), and we read 1, 4, we know that pistons 1 and 4 are at the top of their stroke, and consequently that if 1 is exhausting, 4 is firing, and vice versa.

THE cranks in the average four-cylinder car are set at 180°, so that 1 and 4 are up together, and 2 and 3 are down together, the order of firing being 1, 3, 4, 2, counting from the radiators.

A GOOD way to carry tools on a car is to have a neat little leather handbag provided with a good lock. If this plan is adopted, spanners and pliers, etc., will not vanish in the mysterious way they do sometimes when the car is out of the owner's hands.

SOME people have been troubled to know why, on some occasions, their gears jump out of mesh. It will usually be found that this occurs on cars in which the clutch-shaft carries the sliding sleeve, and if the sliding sleeve is too tight or too loose a fit upon its square when the clutch is either withdrawn or engaged, the gears may be carried with the shaft. It should be noted that this cannot happen if the speed lever quadrant is fitted with square slots.

SOME motorists, when adjusting their chains, do not seem to realise that there is a correct position for the shackles on the back scroll. The top of these side-plates, or shackles, should always be leaning away from the hollow of the scroll.

EVERY owner of a car should be thoroughly conversant with all the working parts, engine, gear-box, etc., or he may find himself in difficulties in a very short time, as the following note will show. A gentleman who owned a car with a gear box which was the exact copy of a Panhard gear-box, found that the reverse was inclined to stick, and finally did not come free. He did not know how the reverse was worked and was in difficulties, and as there are several people who are rather hazy on the Panhard reverse, a word or two dealing with it may be useful.

THE reversing gear in the Panhard box (single lever control) is designed so that there are no wheels running idly when the other speeds are engaged. The reverse shaft, which carries two pinions, lies alongside of the clutch-shaft, and is kept in its normal position by a spiral spring in one of its bearings. When the change lever is moved back beyond the neutral notch, the draw-bar which shifts the gear moves the reverse shaft against the spring, and by means of the two wheels on the shaft a reverse motion is obtained; as soon as the lever is moved back to the neutral, the reverse shaft goes back to its normal position by the action of the spring.

IT is not often that a piston cracks, but it has happened, and if a case of want of compression should occur, and all the valves, etc., are perfect, remove the cylinder. Then scrape the deposit off the top of the piston, and a crack may be found, the mystery then being solved.

WENTWORTH CASTLE is the destination of to-day's (Saturday) run of the Sheffield Automobile Club.

THE Wolverhampton and District Automobile Club will hold a run to Market Drayton to-day (Saturday).

AN automobile club has lately been formed at Auckland, New Zealand, and already the membership list comprises 43 names.

THE Portuguese Government has granted to the Conde de Vizella for fifteen years the exclusive concession for automobile service on various roads in the districts of Loanda and Lunda, in Portuguese West Africa.

THE EXPERIENCES OF AN IRISH PIONEER MOTORIST.

IN our issue of April 25th last we published a description of the novel electrical vehicle designed by Mr. J. Brown, of Dunmurry, Belfast, well-known in the scientific world as an electrician and to the automobile and cycling world as the inventor of the Viagraph—an instrument for testing the quality of road surfaces. Below we print a letter received from Mr. Brown, who is an enthusiastic motorist, in which he relates some of his experiences with motor-cars:—"I enclose you a photograph of my first motor vehicle—the first modern automobile to enter Ireland. I imported it in March, 1896, having purchased it second-hand from my friend the late M. Doazan of St. Omer, who was a very ardent automobilist. It was one of Serpollet's early types, coke fired, steel tyred, weighed 27 cwt., and was not difficult to keep within the legal limit as to speed. It was very easy to work, and pleasant to ride in once it got under way, but this was a work of time. Its former owner said he could heat up the boiler for a start in forty minutes, but he had a forty-foot flue up the side of his house to get a draught. Of course he left this behind—on the house—when he rode out on the car. I had only a twelve-foot pipe to put on to start the fire, and this took two to three hours to 'warm up.' I had nevertheless a good deal of

The First Modern Motor-Car in Ireland—A Serpollet Imported in 1896.

amusement out of this car, and finally sold it for a few pounds more than it cost me originally. I was anxious to get another car that would not take quite so long to get ready. I have always had a peculiarly strong objection to noise in a car; I want it to 'fold up its tent like the Arab and silently steal away.' In 1897 I therefore made a tour via Glasgow, Keighley, Birmingham, Coventry, to London, but found no car that did not clatter to a quite prohibitive extent. As I could not find what I wanted, I decided to make it. Electricity was the only motive power possible, and after much thought and care the vehicle which you illustrated and described in your issue of April 25th was evolved, my friend Professor Fitzgerald, of Queen's College, Belfast, helping me with what I called the dogged details. The slowness of the car on hills and the trouble of re-charging, however, led me to keep on looking out for a quiet petrol or steam car, flexible in speed and suitable for the rough roads we have to put up with here.

"After much hunting about I developed a feeling that it might be best not to spend a large fraction of £1,000 on a car that would probably be superseded in a year or two, and so finding the Oldsmobile came up to my ideas of quietness in running, flexibility, and also ease on rough roads, I bought one last year, and I do not regret it. At first I had a good deal of trouble, but it was chiefly due to ignorant management, and

a too feeble ignition battery. I send a photo of its progress through the floods recently experienced in Belfast. When not too deep, floods have the advantage that one can hop off on to the footpath, using this as a kind of wharf, while the street boys (who are such a dreadful nuisance when the car is left by itself) cannot get at it."

A NEW ACCUMULATOR.

IN the course of the recent Engineering Conference at the Institution of Civil Engineers, Mr. T. E. Gatehouse gave some particulars of a new cell which had been brought before his notice. The Elieson cell, to which he referred, was a pure Planté cell, and, as constructed up to the present, consisted of five plates, two positive and three negative, weighing altogether 16lbs. The total weight of cell, complete with box and acid, is 22lbs., and it has a capacity of 100 ampere-hours at a 5-hours' duration of discharge. In the Elieson cell the whole plate except the central tube is active surface right through, and being perfectly porous permits free circulation of the electrolyte. This is shown very clearly by the fact that while at a discharge rate of twenty amperes the capacity of the cell is 100 ampere-hours, when the discharge rate is fifty amperes the capacity is still ninety ampere-hours, and even at the high rate of 100 amperes a capacity of seventy-three ampere-

Mr. J. Brown on his Oldsmobile in the Floods at Belfast.

hours is still obtained. In charging the same thing holds good. While most cells on the market take four, five, or more hours to charge, the Elieson cell can be charged easily in from 40 to 45 minutes without any loss of capacity, and with a very high ampere-hour efficiency. A practical test has been made of the Elieson battery in a small car. Twenty-four cells have been put in this vehicle, arranged in two batteries of twelve cells each, in parallel, thus running on twenty-four volts. The cells are invariably charged at about ninety-five amperes, which was the largest current conveniently obtainable. For charging the two batteries are in series. The full charge is about eight B.T.U. This car has been running regularly since Easter, and has frequently had two charges in a day. Some of the principal runs are as follows:—(1) A run was made to Reading with only eighteen cells (two batteries of nine cells each, i.e., eighteen volts). The car was charged there in about an hour, and came back on that charge to London the same day. Distance forty miles each way, two passengers. (2) Another run was made to Reading in 3 hours 25 minutes. As the battery was not nearly discharged, a further run was made of ten miles, and the battery was still not fully discharged. Distance, fifty miles, two passengers. (3) The following day the car was charged in one and a quarter hours, and ran back to London with one passenger in 2 hours 50 minutes.

THE THEORY OF THE SILENCER.

IN the design of a silencer for petrol motors there are three conflicting conditions to be met. The silencer must efficiently deaden the noise of the exhaust; it must not offer any appreciable resistance to the exhaust; and it must be compact. In the actual design, of course, still other factors must be considered, but these conditions are the three which determine the general lines. These requirements, as stated, are conflicting. If, for instance, space and weight were no consideration on a motor-car, it would be comparatively easy to devise a silencer thoroughly muffling the exhaust and offering no appreciable back pressure. But the above are very weighty considerations, and the silencer must, therefore, be compact.

On the other hand, the two remaining requirements lead also in opposite directions. Thus a gain in the efficiency of silencing can usually be secured if a sacrifice is made in the matter of back pressure. It must not be inferred from this, however, that in silencers muffling efficiency and back pressure are

less abruptly from a small pipe into a large pressureless chamber.

The expansion chamber is usually divided into a number of compartments, the number of these being entirely dependent upon the form of construction employed. If the silencer is of the sectional type, built up of a number of similar parts, there are usually quite a number of compartments, while in other forms of construction the number is less. One advantage of multi-compartment silencers is that in case of an explosion in the silencer, which is not an infrequent occurrence, the latter is less liable to be seriously damaged.

In this class of exhaust box the form of the final outlet where the gases pass to the atmosphere becomes of less importance, and often consists of a plain circular opening, provided with a short nipple. In silencers in which the expansion chamber has only one or two compartments the form of the final outlet is of the greatest importance, as the retarding effect of all the communicating passages in a multi-compartment silencer must be produced here by this single passage. The

The James-Anderson Steam Omnibus, built about 1829. (See page 491.)

necessarily reciprocal quantities. This is only the case so long as the general features of design remain identical. It is a well-known fact that in the production of sound the action of edges plays an important role. Shrill, penetrating sounds are usually produced by an air column striking the sharp edge of a solid body, while rounded edges will admit of a column of air or gas being drawn into or discharged from a passage with little or no noise.

The silencer always contains an expansion chamber, which allows the charge of burnt gas to expand and the pressure to fall so that it issues from the discharge orifices at a low pressure. The manner in which the exhaust pipe opens into this expansion chamber has considerable influence upon the silencing efficiency. If the chamber be cylindrical in form, for instance, and the exhaust pipe lead into it centrally through one of the heads, cutting off sharp with the inner face of this head, then considerable noise is produced at this entrance, which is transmitted to the outside. The entrance from the exhaust pipe to the chamber must, therefore, remarks the "Horseless Age," be made so that the column of gas passes

question then arises, whether it is best to have a large number of small circular openings or a single narrow angular opening. Another question which does not seem to have been definitely settled is the cubic capacity of the expansion chamber with relation to the displacement of the engine piston.

A SERIOUS motor-car accident was disclosed in a case heard on Monday by the Spelthorne magistrates, the victim being a motor-car driver named George Ridgeway, of Page-street, Westminster, who was said to be lying in a critical condition in the Hounslow Cottage Hospital. Henry Appleton, a carman, was fined 10s. for being drunk while in charge of a van and two horses on the Staines-road, Bedford. A collision occurred between the motor-car and van. This was due to Ridgeway coming suddenly from behind a market-garden cart. He was thrown out and badly injured internally, while one of the brewery horses was struck by the motor-car and severely wounded in the chest. Appleton was also thrown from his van, but escaped with a shaking.

SOUTH AFRICAN NEWS.

[FROM OUR OWN CORRESPONDENT.]

CAPE TOWN, July 21st.

FOR the information of readers of the *Journal*, and more especially of manufacturers at home, I may state that Mr. O. E. Bush, late superintendent of motor-cars to De Beers Consolidated Mines, South Africa, is leaving for England to-morrow by the R.M.S. "Briton." Mr. Bush first came out to South Africa in 1898 with three M.M.C. cars, which were the first imported into the country. Mr. Bush, who was likewise the first man to drive a motor-car in South Africa, has probably had more experience of the roads in the interior than any other motor driver in the country, and with his wide knowledge he should be able to give much valuable advice to builders with regard to the construction of cars for the South African market.

ONE of his most notable trips was during a recent electioneering campaign, when he drove Mr. Abe Bailey on a 12-h.p. Panhard through Griqualand West, the total distance covered in fourteen days being 900 miles, and the average speed of the car

company with a Lanchester from the Rudge-Whitworth garage. On the return journey the "Brush," driven by Mr. Fenton, ran out of petrol when fifty-five miles from Cape Town. None was to be got in the vicinity, and the Lanchester only had enough to carry her back to Cape Town, so the Lanchester's driver, Mr. Saunders, posted back to Cape Town at full speed to fetch petrol. Mr. Graaf, having urgent business in Cape Town, returned with Mr. Saunders. Just as Mr. Fenton was turning in for the night at the hotel, Mr. Pippard, of the Rudge-Whitworth Company, dashed up in a Wolseley with plenty of petrol, so the two cars left for Cape Town the same night, arriving next morning. The Brush is to be fitted with a lower gear, as the existing one is too high for the roads out here.

THE second South African motor meet is to be held on Saturday next, the 8th, in the grounds of the late Mr. Rhodes' residence at Rondebosch, when some interesting speed trials will be held over a flying mile. Dr. Jim has matched his 22-h.p. Daimler against Mr. Graaf's car of the same make and horsepower, the former to be driven by Dr. Jim's mechanic, Mr. Wilson, and the latter by Mr. Fenton. Your correspondent.

Mr. Donald Menzies at the helm of a 12-h.p. Panhard Car at Colesberg, Cape Colony. It will be noticed that the tyres are shod with auxiliary covers called "veldschoons." Mr. W. G. Nettleship, whom we have to thank for sending the photograph, reports that they are found a good means of preserving the tyres from the awful roads.

twenty-two miles per hour. Mr. Bush it was, too, who persuaded Mr. Bailey to go in for a 22-h.p. Daimler, and he also ordered the car, besides ordering two Panhards for De Beers. He is now making his second trip home since his sojourn out here, and intends securing some good motor-car agencies for South Africa.

At the Opera House, Cape Town, where Mr. John Le Hay and Company are playing the musical comedy opera, "Faust up-to-Date," Mr. Le Hay, as Mephistopheles, makes his entrance in the first scene on a motor-car, amidst the usual thunder, lightning and slow music—scene shifters dancing a cellar-flap on an unoffending piece of sheet iron. The mechanic is attired in brilliant red silk motor clothing. The car makes the circuit of the stage two or three times, and then makes its exit on the prompter side, to the accompaniment of flashes of property lightning.

August 5th.

THE recent spell of fine weather here has brought out the motor-cars again, and the roads are now in pretty good condition in and about Cape Town. Mr. D. P. Graaf started out last Friday on his 12-h.p. "Brush" car for De Villiersdorp, in

will act as mechanic to Mr. Fenton on that day. I have heard that the driver of Mr. John Garlick's 24-h.p. Darracq intends challenging the winner of this test.

THE current number of the "Badminton Magazine" contains "More Hints to Modest Motorists," a series of useful notes of value and interest.

As a result of the decision of Eastbourne Corporation to run motor omnibuses, Messrs. Chapman and Sons, the local bus proprietors, have decided to sell their seven vehicles and thirty horses.

A FRENCH driver in the employ of a Manchester gentleman staying at Llandudno has succeeded in driving a 24-h.p. Panhard up the slopes of the Great Orme's Head. The roadway up the mountain is narrow and dangerous, and the gradient at places is about one in seven. Having succeeded in reaching a height of between 500ft. and 600ft., the car was turned round and the return journey made by the same route. The length of the road traversed is about half a mile.

MOTOR-CYCLING NEWS.

HELD under most adverse conditions as regards weather, the Auto Cycle Club's reliability trials were brought to an end on Saturday last. Out of the 44 competitors who started, 32 set out for the run to Basingstoke on Wednesday, the 19th inst., the route taken being via Croydon, Epsom, Leatherhead and Guildford. The Hog's Back was made a compulsory hill climb, every rider having to mount it with or without pedalling, the penalty for failure being the loss of ten marks. At the top of the hill the riders were stopped and sent down the hill again, with instructions to pull up on their brakes and dismount whenever they heard a whistle blown. The hill-climb was successfully made by the bulk of the riders, but the brake test gave some very fluctuating results. Mishaps to three of the machines caused their riders to return by train.

ON Thursday, the 20th inst., thirty-one riders set out for Eastbourne, the climb up River Hill, near Sevenoaks, being included in the return journey. The hill, in the steepest part, has a gradient of 1 in 9.8. Only one rider succeeded in mounting the hill without pedalling, but, in one way or other, all but six managed to make the ascent. The best time was made by the Jap machine (2 min. 3 2-5 sec.), the Chase being second (2 min. 12 2-5 sec.). The last run was to Worthing on Friday, the 24th inst. Owing to the police traps on the previous visit, the route was quietly changed, much to the annoyance of the police at Horsham, whose elaborate preparations were rendered useless. Of the thirty riders who started twenty-eight safely reached the Palace at night.

The "Motor-Car Journal" Challenge Cup, won by J. Leonard on "Humber" Motor-Bicycle.

SATURDAY morning was devoted to a series of five mile speed trials on the track. The machines had to be in exactly the same condition as that in which they had run in the road trials, no stripping of any kind being allowed. F. W. Chase, on the 3-h.p. Chase motor-cycle, covered the distance in 8 min. 8 1-5 sec., or 37 miles per hour, gaining four marks out of a possible five. The next fastest was A. C. Wright on the 2½-h.p. Ormonde (four marks), his time being 8 min. 27 sec. Other performances were: 2½-h.p. Matchless, 9 min. 18 sec., three marks; the 2½-h.p. Bat, 9 min. 20 2-5 sec., three marks; the 3½-h.p. Booth, 9 min. 25 sec., three marks; the 2½-h.p. King, 9 min. 25 2-5 sec., three marks. Only three riders exceeded thirteen minutes. Altogether twenty-one competitors completed the five-mile time trials, the average speed working out at 28.3 miles per hour. The final awards have not reached us up to the time of going to press, the judges meeting on Thursday to go over the reports of each machine.

THE motor-cycle section of the Cyclists' Touring Club is organising a tour from London to Land's End, John o' Groat's, and back to London. The start is fixed for September 24, and it is expected that London will be reached on the return journey on October 14.

THE French authorities, in preparing new designs for the "plaque," which every cyclist in France is compelled to carry on his machine, have decided to issue a distinctive tablet for motor-

cycles. The accompanying illustration shows the special design of motor-cycle plaque, of which 40,000 have been ordered. The new plaques will be issued from January 1st next.

THE Motor Cycling Club will hold the third 200 miles reliability trial to-day (Saturday) at Hatfield, starting at 6 a.m. The Committee has decided to continue the trial upon the same course as before. In addition to the trophy presented by Mr. Edge, and which will be of the value of £20, the Club is giving a second prize of a gold centre medal, and a third prize of a silver medal, while certificates will be given to all competitors completing the distance at an average pace of not less than eleven miles an hour. Any motor-cyclists or cyclists who are willing to assist in the checking of competitors should communicate with the sec., Mr. G. E. Roberts, 17, Fieldhouse Road, Hyde Farm, Balham, S.W. The run on Sunday, the 30th inst., will be to Reading, making the George Hotel the headquarters. The meeting place will be the Marble Arch, 10.30, lunch being fixed for 1.30.

FULLY 9,000 persons were at the Athletic Grounds, Canning Town, on Saturday, to witness the sports promoted by the West Ham United Football Club. H. Martin, on his Excelsior, made an attempt to lower the fifty miles motor-cycle un-paced record. He made a good start, and rode 14 miles in 16 min. 37 2-5 sec., when the belt of his machine came off, and he left the track. Later he attacked the twenty miles record, but owing to the oil tank breaking and flooding the belt he was again obliged to leave the track, after covering 10 miles in 11 min. 54 1-5 sec.

THE motor-cycling hill-climbing competition at Ashford, co. Wicklow, on Saturday, was spoiled by the rain. By the time fixed for the start of the event the road was in such a condition that many of the entrants did not consider it safe to race up the hill at any speed. Consequently only a small number of the thirty-three entrants essayed the attempt, and none of them were able to climb the whole of the hill. Acting under the proclamation of the County Council of Wicklow, the police closed the road to all traffic at 11 a.m.

A DANGER board is to be erected 100 yards from the top of Sun Rising Hill (Warwick) by the Midland A.C.

DRASTIC measures have been adopted to capture a few well-known automobile scorchers who refused to stop when signalled to do so by policemen in Lincoln Park, Chicago. Iron posts have been driven into the ground at various points, across which heavy cables are stretched when occasion demands. As soon as a motorist enters the park at excessive speed the information is telephoned to policemen stationed at the iron posts, and the cables are stretched across to stop him.

HERE AND THERE.

THE motor-bus service between Oxford Circus and Cricklewood has been stopped.

THE Bann Motor Co., Limited, has been registered in Ireland with a capital of £12,500.

London's New Motor Hansom (see page 491.)

THE Duke of Newcastle, in company with some American friends, is on a motor tour in Wales.

THE directors of the Furness Railway Co. are considering the adoption of a combined engine and car to carry fifty passengers.

AT New Brighton, Ashford, and several other places, motorists have lately been fined for driving motor-vehicles without lights.

THE Inland Revenue authorities in London are displaying great activity just now with regard to the owners of motor vehicles.

MADAME LOCKERT, of Paris, who has already made the journey to Berlin, Vienna and Madrid by motor-car, is about to start on an automobile tour to St. Petersburg on a Tony-Huber car.

MR. W. R. McTAGGART, whose place in Grafton Street, Dublin, was a centre of interest during the Irish Fortnight, has taken premises in South William Street, Dublin, for garage purposes.

MESSRS. J. E. HUTTON, LTD., has been registered with a capital of £50,000 to acquire the business of Messrs. J. E. Hutton and J. A. Stirling, who will remain as the first directors of the concern.

A PETITION has been forwarded to the Great Western Railway Company asking them to institute a motor-car service between Witheridge and Tiverton. The former place has no railway facilities.

MR. C. F. PAISLEY has just had a successful run from London to Edinburgh on a 10-h.p. Automotor car. Every hill was negotiated satisfactorily and the car made a good performance throughout the run.

A SERIES of conversion tables for foreign moneys and measures has been issued by the "Commerical Intelligence" Publishing Co., Limited. These should be of service to all having export business dealings.

MR. ARGENT ARCHER has issued a catalogue of photos of the Gordon Bennett race, and of scenes in connection with the Irish automobile fortnight. More than two hundred photographs were taken by him.

MR. C. FIPPARD, of the Horley Motor Works, undertakes any kind of motor repairs. He has enlarged and remodelled his works and put in a new plant of machine tools. Motorists in trouble near Horley will find Mr. Fippard a friend in need.

AMONG the many interesting reports presented to the recent Automobile Congress in Paris was one by M.R. Arnoux on "The Ignition of the Charge in Explosion Motors." The report has now been reprinted in pamphlet form by Madame Lockert, of *Le Chauffeur*, Paris, from whom anyone with an interest in the subject may obtain copies.

A DELEGATION of motorists appeared before the county commissioners at Minneapolis, U.S.A., recently, and asked for the straightening of some of the crooked portions of the road from Shakopee to Eden Prairie. The county surveyor was instructed to survey the land in the neighbourhood with a view of ascertaining the cost of the work.

IN our last issue we mentioned the case of an abortive prosecution by the London County Council against a motorist for emitting smoke, etc., from a petrol motor. We now learn that two more summonses have been issued against owners of petrol motors for an alleged similar offence, so it behoves motorists to be careful of their flow of lubricating oil, otherwise a vigilant policeman will have their names and addresses.

THE Wolseley Tool and Motor Car Co., Ltd., have sent us a copy of the new catalogue of Wolseley motor-vehicles they have issued. The list is beautifully got up, the illustrations being particularly clear. It gives details of the Wolseley 5, 7½, 10, 20, and 50-h.p. cars, a considerable portion of the catalogue being usefully devoted to a description of the motor, change-speed gear, cooling system, etc. Altogether the list is one which does credit to the Wolseley Co.

On the way to the Arctic Circle.
(Das Schnauser's Muntch.)

THOUGH it contains little that is new, the latest volume in the Library of Useful Stories published by Messrs. George Newnes, Limited, is more than usually interesting to our readers. It deals with the development of Rapid Transit, and Mr. Beckles Willson traces the subject from the passing of the Turnpike Act of 1633 to the coming of the mono-rail and modern motor-car. The chapter dealing with the latter subject is very well done, although from our point of view it might have been usefully expanded without encroaching upon the general plan of the work.

THE Carlton Motor Company, Limited, has been registered with a capital of £800.

MR. THEO. MASUI, the agent for the Germain cars, has opened a repair department and garage at 14, Coach and Horses Yard, Old Burlington Street, W.

MESSRS. FRANK F. WELLINGTON, LIMITED, have just supplied one of their 14-h.p. "Brooke" cars to Lord Hastings for use at his country seat at Melton Constable, in Norfolk. The

Lord Hastings on his "Brooke" Car.

car is fitted with a removable canopy and finished with a natural wood varnished body. It is, of course, well known that Lord Hastings is a keen automobilist and takes great pleasure in driving his various cars himself. It may be mentioned that with this car was supplied a double pair of driving wheels, one with "Sirdar" tyres and the other with pneumatic.

AUTOMOBILISTS are to assist Chicago in celebrating her centennial jubilee, which is to be observed during the week ending October 1st. In addition to races, an evening automobile parade, with two thousand illuminated cars in line, three abreast, will be one of the pageants.

SAINSBURY'S Anti-skidders, Limited, is the title of a company registered recently to adopt an agreement with Mr. W. D. Sainsbury, and to carry on the business of manufacturers of and dealers in devices for preventing side-slipping or skidding of motor-cars, cycles, vehicles, and velocipedes of every description, cycle, motor-car, carriage, and tyre manufacturers and dealers, &c.

As showing the signs of the times, we may refer to the presence the other afternoon, in Piccadilly, W., of an Oldsmobile, with Mr. Peckham; an electric hansom, similar to that shown by M. Jeanteaud at the exhibition at the Agricultural Hall in 1896, and a Foden steam wagon of Messrs. Mears, with a trailer, all following one another; while, proceeding in the opposite direction, were two ordinary "City and Suburbans" and a petrol car.

MOTOR-CARS are to be employed on an unusually large scale during the annual manoeuvres of the German army in Saxony next month. Twelve cars in all are to be used. Six of them are the permanent property of the War Department. They include a 16-h.p. Mercedes, a 12-h.p. and a 16-h.p. German Daimler, a 10-h.p. and a 16-h.p. Benz and a 15-h.p. Dürkopp. The other six vehicles will be lent by various German makers. Herr Willy Poege, of Chemnitz, has also put at the disposal of the Crown Prince of Saxony, commanding the 12th Army Corps, the 60-h.p. Mercedes car with which he recently won a trophy at the Ostend meeting.

MESSRS. SHIPPEY BROTHERS are placing on the market a new "Puncture Proof Jelly Compound" which is likely to fill a long felt want. A number of owners of Locomobiles, Toledos, and other steam cars as well as of Oldsmobiles, were invited last week to witness some experiments as to the merits of the new compound. Several Locomobile tyres were filled with it, pumped up and then punctured, time after time, with bradawls, French nails, etc.; the tyres were instantly healed up and no holes whatever could be discovered beyond a small dark speck on the rubber, which had been closed up by this new process. Another experiment was made in which a tyre, of a porous nature, and leaking very badly at the valves, was filled with a pint of "Rubberine" compound jelly, as it is called. After being pumped up the tyre was put to the water test, but no leakage could be discovered. The process of repair is a very simple one; all that has to be done is to unwind the wire and remove the valve, put into the tyre about one pint of the jelly compound, replace the valve, pump up, and twirl the wheel round a few times, so as to evenly distribute the compound over the inside. Another advantage claimed for the compound is that it will keep the canvas of the tyre cool and pliable, thus retaining the elasticity of the rubber when running on the roads. The new compound should find a ready sale amongst owners of light cars shod with "Diamond" single tube or other American single tube tyres, for which it is apparently best suited.

A NEW catalogue of their lamps and "motorcessories" comes from Messrs. Salsbury and Son, Limited, in which some idea of the growing importance of the motor industry is revealed in unmistakable fashion. According to the firm's own observations the ideal lamp for motor-vehicle purposes should not give a mere glimmer just sufficient to indicate the presence of the automobilist, but it should throw a good light ahead to show the way and enable the driver to avoid obstructions. It should also be so constructed as to show the side of the road. The most important feature of all is that the construction of the lamp and the method of its attachment on the vehicle should be such as to reduce to a minimum the possibility of gas from escaping petrol coming in contact with the light of the lamp, which has been the cause of several serious accidents and burnings of cars.

THE Vehicle Equipment Company, of Hartford, Conn., U.S.A., has recently completed what is claimed to be the largest electrical motor-car in the world. As will be seen from the accompanying illustration, it is a huge char-a-banc, having eight rows of seats sufficient to accommodate forty persons, including the driver. It has been built for the American Sight Seeing Company, of New York, which hitherto has employed six-horse

coaches to convey tourists round New York. The vehicle is driven by means of electrical motors, geared to the rear wheels. Current is furnished by a battery of forty-four Exide accumulators of the same size as is used on the company's five-ton electrical wagons. The controller is adapted to give four speeds forward and reverse, the top speed being eight miles an hour, at which it is estimated the car will be able to cover a distance of thirty miles on one charge. The char-a-banc is 22 ft. long by 7 ft. in width, and its weight complete is about three-and-a-half tons.

CORRESPONDENCE.

THE MIESSE STEAM CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "Faber," after considering the merits of all the leading steam cars, I purchased a 6-h.p. Miesse, and certainly consider it an excellent car and quite in the front rank. Having had considerable personal experience with the railway locomotive, I decided to try steam in place of petrol, and I certainly do not regret my decision. The absence of vibration and complication, and the advantage of being able to burn common paraffin oil, are to my way of thinking most essential. I may remark I do not employ a mechanic or driver, and perhaps my opinion is worth more than that of an owner whose car is looked after and driven, as the owner in the latter case knows very little of the minor troubles which attend all kinds of cars, as these are eliminated before he takes his seat, probably.

I may add that the Miesse is a very simple car, and devoid of the

specified width brings the great majority of roads within its scope. Moreover, even the most careful drivers will suffer from it, and, indeed, they more than the scorcher, for the latter naturally confines himself to the main roads, and will therefore be little inconvenienced by it.—Yours truly,

FABER.

STARTING AND STOPPING TRIALS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice from your last issue that the novel and useful starting and stopping speed trial inaugurated at the Laffrey meet the other week is to be repeated at Deauville. Might I suggest that the A.C.G.B.I. or one of the provincial clubs might copy the idea and organise a similar event in this country? It could be carried out in many private grounds, as only a relatively short stretch is required, and would be an interesting competition, as it not only tests the cars, but also gives scope for display of the skill of the drivers. The short dis-

Professor Hubert von Herkomer on his 10-h.p. Panhard. (See page 489.)

[Allgemeine Automobil Zeitung.]

many automatic arrangements used in some steamers, and my experience with automatic arrangements is they add great complication in oiling the number of working parts and often fail at the critical moment. Personally I prefer a car that requires intelligence to drive, as where the control is more in the hands of the driver, more pleasure is derived from its use.—Yours truly,

A. G.

THE MOTOR CAR ACT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Sir Walter Foster's anxiety—alluded to by you in the last issue—lest the speed limit should prove a detriment to doctors and their patients, is, I fear, needless, for the simple reason that no country doctor will be able to use a motor-car at all, since the operation of the "16-foot clause" will prohibit its employment in large areas of his district. I earnestly hope that early and energetic measures will be taken to restrict as far as possible the application of this clause, which seems to me by far the most important and mischievous of an ill-judged Act, especially as its applicability to any road of which a part merely is of the

tance speed trial from a standing start and a stopping finish is perhaps rather hard on the tyres, but, as motorists have been found willing to enter for brake trials of a severe character, it is probable they would be still more ready to take part in these tests, which are of a much more sporting and interesting character. Cannot such an event be included in the programme of the coming meeting on Southport promenade?—Yours truly,

START AND STOP.

MOTORING IN SOUTH AFRICA.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice in your issue of July 18th, under the heading of "South African News," you have a paragraph with regard to the Cape Town police which I think, in justice to them, I cannot allow to pass unchallenged. It is therein stated "that constables have had instructions not to take anybody's name and address, but to march them straight away to the charge office." Instead of this being the case, the relations between motorists and the police are of a most cordial and satisfactory nature, and there is no case on record of such an action on

their part. The chief of the Cape police, Colonel Robinson, is most sympathetic and friendly in his attitude to the Automobile Club, and he has been good enough to advise us that he will not proceed against any members of the club for furious driving without first advising the club of the intended action of the police.

The Automobile Club of South Africa is doing all in its power to get its members to exercise reasonable care and caution in driving, and it feels that the publication of such a paragraph as the one referred to in your paper tends to give a most erroneous and unfair impression of the attitude of the Cape police to motorists.—Yours faithfully,

A. T. HENNESSY,
Chairman Automobile Club of S.A.

AN "ACT" OF DISCOURAGEMENT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read your article under the above heading in your valuable paper of the 22nd inst., and while I am in entire sympathy with every right-minded man and every automobilist who looks upon this Government measure as a disgrace to the Statutes of an enlightened country, I cannot agree with the statement contained in your article which suggests that the Automobile Club has been a party to the weakness and blundering so conspicuous in the action of the Government in regard to it. You say, and I take exception to the words, "Unfortunately, however, the original sin must be laid at the doors of the Automobile Club," for I think you must be aware, although perhaps you have not realised the full force of it, that the Cabinet Ministers responsible for this measure have been repeatedly pledged to the responsible members of the Automobile Club for at least two

stupidity, sooner or later raise such a cry from natural justice that it will bring about its own extinction.—Yours faithfully,

T. W. STAPLEE FIRTH.

HANDICAPPING CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—So many remarks have been made re the handicaps at the Midland Club's hill climb, on July 25th, that it has occurred to me that a formula for determining the results in future should be decided upon. In handicapping, the determination of the h.p. has always been the bugbear. Now 33,000 ft. lbs. per 60 secs. = 1 h.p. From this we obtain the following, having obtained the rise in feet on the hill, viz.,

$60 \times W. \text{ in lbs. } \times \text{rise in feet}$

$T. \text{ in lbs. } \times 33,000$

equals actual h.p. given off by each car. Now in the case of Sun Rising Hill we actually had a rise of 285 ft. If we have a course 100 yds. shorter, it would give us a rise of 275 ft. This would reduce the formula to

$W. \text{ in lbs.}$

$2 T.$

and would give the actual h.p. Why not use this as a constant? Cylinder dimensions, revolutions, etc., fall out of the calculation, and a certain result is obtained.—Yours truly,

T. C. AVELING, A.M.I.C.E.

RENEWAL OF PARTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—May I be allowed to protest, through the columns of your

The Meet of the Lincolnshire Automobile Club at Roxholme.

years to abolish the speed limit, if the Automobile Club would support the Government getting registration and numbering of motor-cars. This the Club considered as being the only plan for putting a stop to those men, who, in the guise of gentlemen and sportsmen, make use of the public roads without the slightest consideration for other users, and dash about under circumstances which are wholly incompatible with the best traditions of the gentleman and sportsman. These are amongst the real enemies of the automobile movement.

You and your readers are well aware that this pledge was loyally carried out by the House of Lords and the speed limit was abolished. Subsequently, when the Bill was sent to the lower House, an adverse shout went up from a delirious section of that House, and the Cabinet, who were directly responsible for the pledge they had given the automobilists throughout the kingdom through the Automobile Club, tore up their pledge and deliberately broke their word without a moment's notice to those to whom they had pledged to abolish the speed limit, and they, in the teeth of the fact that the County Councils and chief constables throughout the kingdom had voted against the speed limit, truckled to an ignorant section of the House, and brought forward this speed limit at the very last moment.

It is obvious from past experiences that this great industry is more or less in the hands of the most uneducated section of our community, namely, the policemen. In a few places, these men have been making promotion and capital by trumping up cases under a stupid law, and they have resorted to underhanded methods in order to manufacture evidence and trump up cases against motorists, and have in a few places, notably Kingston, Reigate, Horsham, etc., obtained a willing stalking horse in magistrates whose good sense as such seems to have entirely left them.

The enactment which has now been passed must, from its inherent

paper, against the way in which importers of foreign cars overcharge the buyer for any parts or renewals that he requires? I have lately had a case before me in which a friend of mine had occasion to send to London for a small part for a French car; the whole thing could not have possibly cost more than a few shillings, and he was charged several pounds for it.—Yours truly,

FAIRPLAY.

ADDRESS WANTED.—The address of Mr. R. Galbraith, who has made some suggestions with regard to profitable motor-car routes in Ireland, is wanted by an English correspondent.

WITH regard to Mr. M. R. D. Roberts' letter on a "new air-cooling method," Mr. Henry Sturmey writes:—"In reply to Mr. M. R. D. Roberts in your last issue permit me to state that I have also secured provisional protection for a method of radiation by points very similar to that described by him, and I believe I am in front of him. There may be others, of course."

CLUB NEWS.

LINCOLNSHIRE.

THE series of successful gatherings held by the Lincolnshire A.C. was followed up on Saturday by a large meet of members at Roxholme Hall, on the invitation of the chairman of the club, Capt. J. A. Cole. There was a very good muster, among those present being Mr. E. Cragg, M.D., hon. sec.; Mr. and Mrs. J. R. Richardson, Major E. Goddard, Messrs. C. H. Gilbert, E. N. Bell, W. R. Pennell, Holloway, Rich. Godfrey Lorne, G. J. Wilkinson, F. Richardson, C. Holland, R. M. Wright, Dr. Gilpin, Messrs. C. W. Pennell, Linnell, Capt. Lyall, Dr. Husband

G. H. Preston, Dr. Russell, R. Gleed, and B. Smith; most of the motorists were accompanied by ladies. After the cars had entered the park, tea was taken on the lawn, and then a very interesting competition was held for a prize offered by the chairman. The cars were started in the "coachhouse," run out of the gates and down the drive, reversed along a hill, returned and reversed into the "coachhouse." The winner proved to be Mr. C. Holland, Boston, 7½-h.p. Wolseley; time, 2min. 2 4-5sec. Other competitors included Mr. R. M. Wright, Lincoln, 12-h.p. Georges Richard, in 2min. 5sec.; Major Goddard, 12-h.p. Richardson, 2min. 8sec.; Capt. J. A. Cole, 12-h.p. Durkopp, 2min. 15 2-5sec.; Dr. Gilpin, Bourne, 8-h.p. Peugeot, 2min. 35 3-5sec.

SHEFFIELD.

THE Sheffield Club is having a run to Wentworth Castle to-day (Saturday). The cars will meet at Wortley at 3.30 p.m. and proceed via Thurgoland to Stainborough Park. On the 5th prox. there will be a special week-end run to Buxton to meet the Manchester and other automobile clubs.

WEST SURREY.

A HILL-CLIMBING handicap was held by this club on Saturday last, at Hind Head, the course being from the Red Lion Inn to the summit, a distance of 2 miles 1,458 yards, with a rise of 520 feet, the steepest gradient being 1 in 13. Eleven cars had entered, of which nine appeared at the starting point, the results being as follows:—

Driver.	Car.	Time.	Handicap.	No. of
		m.'s.	m. s.	passen- gers.
Major Matson	6½ Benz	15.2	9.30	4
Mr. Fennings	4½ Pieper	14.	7.30	1
Mr. Buttmer.....	10 Decauville	11.0	4.0	3
Mr. Ponsford	8 Clement	11.15	3.30	2
Mr. Crothers, jun....	9 Darracq	14.25	4.30	4

Preparing for the "Motor Car Journal" Cup Handicap.

MOTOR CYCLE RACING AT THE CRYSTAL PALACE

KING SOL, who seems to have this year taken a protracted holiday was kind enough to favour England—at least the southern portion—with his welcome presence on Saturday last, and so enabled the annual race meeting of the Auto Cycle Club at the Crystal Palace to take place under most satisfactory weather conditions. The result was that the grand stand was fairly well filled with spectators, while an interested crowd gathered together on the bank on the north side of the track. The first event of the day was a one-hour scratch race for the "Autocar" Cup, limited to motor-bicycles with engines having a total capacity in which the diameter in mm., multiplied by the diameter in mm., multiplied by the stroke in mm., does not exceed 343,000, that is 70 by 70, such machines not to exceed 114 lbs. in weight. Of the nine entries for this event seven faced the starter, including J. Van Hooydonk, the holder of the Cup. J. F. Crundall on a Humber quickly took the lead, followed by Hooydonk (Phoenix), and it was soon seen that, except for accidents, Crundall was to be the winner. Early in the race E. Burgess (Weller) and E. Kickham (Leader) retired, leaving only five competitors on the track. The result was: J. F. Crundall (distance, 42 miles 1,260 yards), first; J. Van Hooydonk (38 miles 880 yards), second; S. C. Holloway (Minerva) (38 miles 140 yards), third.

The five miles handicap for the "Motor-Car Journal" cup brought out the largest number of entries. The event, which was open to motor-bicycles with engines having a total capacity in which the diameter in mm., multiplied by the diameter in mm., multiplied by the stroke in mm., does not exceed 440,000, machines not to exceed 170 lbs. in weight, was run off in four heats and a final, in which the fastest loser was allowed to compete. Heat 1 brought out S. C. Holloway (holder of the Cup) (Minerva), scratch; J. Leonard (Humber), 5sec.; E. Kickham (Leader) 5 sec.; S. Wright (Excelsior) and F. P. Prestwich (Triumph) 20 sec. The race proved a tussle between Wright and

W. Parry on his "Rigid" finishing his Flying Mile.

MOTOR-CYCLE RACES AT THE CRYSTAL PALACE.

Dr. Thorne-Thorne	6 Benz	19.50	8.30	2
Mr. Pullman, jun. ...	4½ De Dion	17.5	6.0	2
Col. Fairtlough	12 Darracq	13.45	2.0	4
Mr. King.....	3½ Benz	22.50	12.0	2

Mr. R. W. Buttmer acted as starter, assisted by Mr. Pullman, sen., whose 15-h.p. Durkopp (the scratch car) had unfortunately not arrived from the makers in time to take part, and who therefore followed the trials in a 1-h.p. hippomobile, which would not have come in last had its time been taken. The timing at the finish was undertaken by Mr. Crothers, sen. (hon. treasurer) and Mr. Muntz. The handicapping was somewhat in favour of the weaker cars, whose performance was nevertheless highly creditable. Mr. Crothers subsequently entertained the members to tea at "Moorlands," Hind Head.

LEICESTERSHIRE.

MARKET HARBOROUGH is to be visited by the Leicestershire Club to-day (Saturday), the outward journey being via Lutterworth and Bosworth. The return route will be by way of Bosworth.

NO LICENCE.

At Retford Borough Police Court, J. H. Denman, of Carolgate, Retford, was summoned by the Inland Revenue authorities for having in use a motor-bicycle and trailer without having a licence for them. It was pointed out by the prosecution that the defendant was liable to pay 15s. each for the motor-bicycle and trailer. For the defence it was stated that the motor-bicycle had been used to carry goods in the defendant's trade, and that as it was not used for pleasure he was not aware that he needed a licence. The Bench inflicted a fine of £1, including costs.

The defendant was also fined £1, including costs, for storing a larger quantity of petrol than is permitted by the Explosives Act.

Leonard, the former winning in 7 min. 10 4-5 sec. Owing to the judges considering the silencer on Wright's motor-cycle inefficient, he was, however, disqualified. Heat 2 brought out five more riders:—J. Van Hooydonk, scratch; C. R. Collier (Matchless), 5 sec.; W. Genn (Eland), 10 sec.; E. Burgess (Weller), 15 sec.; and P. Harris (Minerva), 40 sec. Collier proved the victor in this event, finishing first in 7 min. 26 3-5 sec. but an inefficient silencer was also the cause of his disqualification, his place being taken by the second man, Hooydonk. For Heat 3 another batch of five competitors came out:—J. F. Crundall (Humber), and H. W. Stone (Rex), both being on scratch, W. Parry (Minerva), 5 sec., C. H. Richards (Minerva), 25 sec., and B. Gylee (Minerva), 40 sec. This proved to be the most exciting and yet the most disappointing race of the afternoon. Crundall and Stone rode a neck and neck race, and quickly overhauled two of the riders. Unobservedly, however, Richards had been steadily forging ahead on his Minerva, and, to the surprise of the spectators, passed both Crundall and Stone. Steadily increasing his lead, the heat seemed a foregone conclusion when, to the astonishment of everybody, it was seen that Richards had stopped—for want of petrol! The heat finished with Stone in the first place (7 min. 58 2-5 sec.) followed by Crundall. There were five entries for Heat 4, but only Bert Yates turned out, his time for the five miles being 7 min. 13 3-5 sec. The final was a battle of giants, as will be seen from the fact that the time was only 6 min. 54 4-5 sec. The competitors were J. Leonard, J. Van Hooydonk, H. Stone, B. Yates and J. F. Crundall. The latter started as the fastest loser, but did not finish owing to ignition troubles. The race proved a victory for J. Leonard (Humber), J. Van Hooydonk being second, B. Yates third.

The third event of the programme consisted of a series of mile time trials with a flying start for the "Automotor Journal" cup, open to motor bicycles with engines having a total capacity in which the diameter in mm., multiplied by the diameter in mm., multiplied by the stroke in

mm., does not exceed 440,000, that is 76 by 76. Machines not to exceed 170 lbs. in weight. Out of the fourteen entries, thirteen competed. The best time was made by C. R. Collier (Matchless), 1 min. 15 sec., but he was again disqualified on the silencer question, the result being J. F. Crundall, 1 min. 19.2-5 sec., first; J. Van Hooydonk, 1 min. 19.3-5 sec., second; J. Leonard, 1 min. 24.3-5 sec., third.

In addition to the cups, first, second and third prizes, consisting of gold, silver and bronze medals, were awarded to the riders of the winning machines in each event.

THE MOTOR CAR ACT, 1903.

THE following is the text of this Act to amend the Locomotives on Highways Act, 1896:—

Be it enacted by the King's most Excellent Majesty, by and with the advice and consent of the Lords Spiritual and Temporal, and Commons, in this present Parliament assembled, and by the authority of the same, as follows:—

1.—(1) If any person drives a motor-car on a public highway recklessly or negligently, or at a speed or in a manner which is dangerous to the public, having regard to all the circumstances of the case, including the nature, condition, and use of the highway, and to the amount of traffic which actually is at the time, or which might reasonably be expected to be, on the highway, that person shall be guilty of an offence under this Act.

(2) Any police constable may apprehend without warrant the driver of any car who commits an offence under this section within his view, if he refuses to give his name and address or produce his licence on demand, or if the motor-car does not bear the mark or marks of identification.

(3) If the driver of any car who commits an offence under this section refuses to give his name or address, or gives a false name or address, he shall be guilty of an offence under this Act, and it shall be the duty of the owner of the car, if required, to give any information which it is within his power to give, and which may lead to the identification and apprehension of the driver, and if the owner fails to do so he also shall be guilty of an offence under this Act.

2.—(1) Every motor-car shall be registered with the council of a county or county borough, and every such council shall assign a separate number to every car registered with them.

(2) A mark indicating the registered number of the car and the council with which the car is registered shall be fixed on the car or on a vehicle drawn by the car, or on both, in such manner as the council require in conformity with regulations of the Local Government Board made under this Act.

(3) A fee of twenty shillings shall be charged by the council of a county or county borough on the registration of a car, except in the case of motor-cycles, for which the fee shall be five shillings.

(4) If a car is used on a public highway without being registered, or if the mark to be fixed in accordance with this Act is not so fixed, or if, being so fixed, it is in any way obscured or rendered or allowed to become not easily distinguishable, the person driving the car shall be guilty of an offence under this Act, unless, in the case of a prosecution for obscuring a mark or rendering or allowing it to become not easily distinguishable, he proves that he has taken all steps reasonably practicable to prevent the mark being obscured or rendered not easily distinguishable.

Provided that—

(a) A person shall not be liable to a penalty under this section if he proves that he has had no reasonable opportunity of registering the car in accordance with this section, and that the car is being driven on a highway for the purpose of being so registered; and

(b) The council of any county or county borough in which the business premises of any manufacturer of, or dealer in, motor-cars are situated, may, on payment of such annual fee, not exceeding three pounds, as the council require, assign to that manufacturer or dealer a general identification mark which may be used for any car on trial after completion, or on trial by an intending purchaser, and a person shall not be liable to a penalty under this section while so using the car if the mark so assigned is fixed upon the car in the manner required by the council in accordance with regulations of the Local Government Board made under this Act.

3.—(1) A person shall not drive a motor-car on a public highway unless he is licensed for the purpose under this section, and a person shall not employ any person who is not so licensed to drive a motor-car.

If any person acts in contravention of this provision he shall be guilty of an offence under this Act.

(2) The council of a county or county borough shall grant a licence to drive a motor-car to any person applying for it who resides in that county or county borough on payment of a fee of five shillings, unless the applicant is disqualified under the provisions of this Act.

(3) A licence shall remain in force for a period of twelve months from the date on which it is granted, but shall be renewable, and the same provisions shall apply with respect to the renewal of the licence as apply with respect to the grant of the licence.

(4) A licence must be produced by any person driving a motor-car

when demanded by a police constable. If any person fails so to produce his licence, he shall be liable, on summary conviction, in respect of each offence, to a fine not exceeding five pounds.

(5) Any person under the age of seventeen years shall be disqualified for obtaining a licence (except that a licence limited to driving motor-cycles may be granted to a person over the age of fourteen years), and any person who already holds a licence shall be disqualified for obtaining another licence while the licence so held by him is in force.

4.—(1) Any court before whom a person is convicted of an offence under this Act, or of any offence in connection with the driving of a motor-car, other than a first or second offence, consisting solely of exceeding any limit of speed fixed under this Act—

(a) may, if the person convicted holds any licence under this Act, suspend that licence for such time as the court thinks fit, and, if the court thinks fit, also declare the person convicted disqualified for obtaining a licence for such further time after the expiration of the licence as the court thinks fit; and

(b) may, if the person convicted does not hold any licence under this Act, declare him disqualified for obtaining a licence for such time as the court thinks fit; and

(c) if the person convicted holds any licence under this Act, shall cause particulars of the conviction and of any order of the court made under this section, to be endorsed upon any licence held by him, and he shall also cause a copy of those particulars to be sent to the council by whom any licence so endorsed has been granted.

(2) Any person so convicted, if he holds any licence under this Act shall produce the licence within a reasonable time for the purposes of endorsement, and if he fails to do so shall be guilty of an offence under this Act.

(3) A licence so suspended by the court shall during the term of suspension be of no effect, and a person whose licence is suspended or who is declared by the court to be disqualified for obtaining a licence shall during the period of suspension or disqualification be disqualified for obtaining a licence.

(4) Any person who is by virtue of an order of the court under this section disqualified for obtaining a licence may appeal against the order in the same manner as a person may appeal who is ordered to be imprisoned without the option of a fine; and the court may, if they think fit, pending the appeal, defer the operation of the order.

(5) If any person, who under the provisions of this Act is disqualified for obtaining a licence, applies for or obtains a licence while he is so disqualified, or if any person whose licence has been endorsed applies for or obtains a licence without giving particulars of the endorsement, that person shall be guilty of an offence under this Act, and any licence so obtained shall be of no effect.

5. If any person forges or fraudulently alters or uses, or fraudulently lends or allows to be used by any other person, any mark for identifying a car or any licence under this Act he shall be guilty of an offence under this Act.

6. A person driving a motor-car shall, in any case, if an accident occurs to any person, whether on foot, on horseback, or in a vehicle, or to any horse or vehicle in charge of any person, owing to the presence of the motor-car on the road, stop, and if required, give his name and address, and also the name and address of the owner and the registration mark or number of the car; and if any person knowingly acts in contravention of this section, he shall be liable, on summary conviction, in respect of the first offence to a fine not exceeding ten pounds, and in respect of the second offence to a fine not exceeding twenty pounds, and in respect of any subsequent offence to a fine not exceeding twenty pounds, or, in the discretion of the court, to a term of imprisonment not exceeding one month.

7.—(1) The Local Government Board may, under section six of the Locomotives on Highways Act, 1896 (in this Act referred to as the principal Act), make regulations—

(a) providing generally for facilitating the identification of motor-cars, and in particular for determining, and regulating generally the size, shape, and character of the identifying marks to be fixed under this Act, and the mode in which they are to be fixed and to be rendered easily distinguishable whether by night or by day, and with respect to the registration of cars, and the entry of particulars, including particulars of the ownership of the car, in the register, and the giving of those particulars, and for making any particulars contained in the register available for use by the police, and for making the registration of a car void if the regulations as to registration are not complied with; and

(b) with respect to the licences to be granted by the councils of counties or county borough, under this Act, and in particular with respect to the register to be kept of those licences and the renewal of licences, and for providing special facilities for granting licences to persons not resident in the United Kingdom, and for communicating particulars thereof to adjoining and other county or county borough councils, and for making any particulars with respect to any persons whose licences are suspended or endorsed available for use by the police, and for preventing a person holding more than one licence.

(2) The councils of counties and county boroughs shall comply with any regulations so made by the Local Government Board, and may if

authorised by those regulations and in accordance therewith charge in respect of the entry of particulars of the ownership of a car on change of ownership such fee, not exceeding ten shillings, as may be prescribed by the regulations, and in respect of the issue of a new licence in the place of a licence lost or defaced such fee not exceeding one shilling as may be prescribed by the regulations.

8. The Local Government Board may, by regulations made under section six of the principal Act, prohibit or restrict the driving of any motor cars, or of any special kind of motor-cars, on any specified highway, or part of a highway, which does not exceed sixteen feet in width, or on which ordinary motor-car traffic would, in their opinion, be especially dangerous.

9.—(1) Section four of the principal Act (which relates to the rate of speed of motor-cars) is hereby repealed, but a person shall not, under any circumstances, drive a motor-car on a public highway at a speed exceeding twenty miles per hour, and, within any limits or place referred to in regulations made by the Local Government Board with a view to the safety of the public on the application of the local authority of the area in which the limits or place are situate, a person shall not drive a motor-car at a speed exceeding ten miles per hour.

If any person acts in contravention of this provision he shall be liable, on summary conviction, in respect of the first offence to a fine not exceeding ten pounds, and in respect of the second offence to a fine not exceeding twenty pounds, and in respect of any subsequent offence to a fine not exceeding fifty pounds, but a person shall not be convicted under this provision for exceeding the limit of speed of twenty miles merely on the opinion of one witness as to the rate of speed.

(2) Where a person is prosecuted for an offence under this section, he shall not be convicted unless he is warned of the intended prosecution at the time the offence is committed, or unless notice of the intended prosecution is sent to him or to the owner of the car as entered on the register within such time after the offence is committed, not exceeding twenty-one days, as the court think reasonable.

(3) The Local Government Board may, without any application from the local authority, after considering any objections which may be raised by the local authority, revoke or alter any regulation made by them under this section.

(4) For the purposes of this section the expression local authority means—

- (a) as respects the City of London, the mayor, aldermen, and commons of the City of London in common council assembled; and
- (b) as respects a municipal borough with a population of over ten thousand according to the last census taken before the passing of this Act, the council of the borough; and
- (c) as respects any other area, the county council.

10.—(1) Local authorities within the meaning of the last preceding section shall give public notice of any regulation of the Local Government Board made in pursuance of this Act prohibiting or restricting the use of motor-cars on any highway or part of a highway, or limiting the speed of motor-cars within any limits or place, and for the purpose of giving effect to any such regulation shall place notices in conspicuous places on or near the highway, part of a highway, limits, or place to which the regulation refers.

(2) Subject to regulations as to size and colours to be made by the Local Government Board, local authorities within the meaning of the last preceding section shall within their areas cause to be set up sign posts denoting dangerous corners, cross-roads, and precipitous places, where such sign posts appear to them to be necessary.

11.—(1) A person guilty of an offence under this Act for which no special penalty is provided shall be liable on summary conviction in respect of each offence to a fine not exceeding twenty pounds, or in the case of a second or subsequent conviction to a fine not exceeding fifty pounds, or in the discretion of the court to imprisonment for a period not exceeding three months.

(2) Any person adjudged to pay a fine exceeding twenty shillings under this Act may appeal against the conviction in the same manner as he may appeal if ordered to be imprisoned without the option of a fine.

12.—(1) The Local Government Board by regulations made under section six of the principal Act may, as respects any class of vehicle mentioned in the regulations, increase the maximum weights of three tons and four tons mentioned in section one of that Act, subject to any conditions as to the use and construction of the vehicle which may be made by the regulations.

(2) The power of the Local Government Board to make regulations under section six of the Locomotives on Highways Act, 1896, shall, as respects motor-cars exceeding two tons in weight unladen, include a power to make regulations as to speed.

13. The definition of "male servant" in subsection three of section nineteen of the Revenue Act, 1869, as amended by section five of the Customs and Inland Revenue Act, 1876, shall be construed as if a person employed to drive a motor-car were included in that definition.

14. Subsections one and five of section eighty-seven of the Local Government Act, 1888 (which relates to local inquiries), shall apply for the purpose of the carrying out by the Local Government Board of any of their duties under this Act.

15. Nothing in this Act shall affect any liability of the driver or owner of a motor-car by virtue of any statute or at common law.

16. It is hereby declared that this Act and the principal Act apply to persons in the public service of the Crown.

17.—(1) A motor-car shall not be driven on or over Menai Bridge except in accordance with regulations made by the Commissioners of Works.

(2) If any person acts in contravention of this section he shall be liable on summary conviction in respect of the first offence to a fine not exceeding ten pounds, and in respect of the second offence to a fine not exceeding twenty pounds, and in respect of any subsequent offence to a fine not exceeding fifty pounds.

18. In the application of this Act to Scotland—

- (1) a reference to the Secretary for Scotland shall be substituted for a reference to the Local Government Board; and
- (2) a reference to the council of a royal, parliamentary, or police burgh, containing within its boundaries, as ascertained, fixed, or determined for police purposes, a population according to the census for the time being last taken of or exceeding fifty thousand, shall be substituted for a reference to the council of a county borough, and every other burgh shall be deemed to form part of the county within which it is situate; and
- (3) the road authority of any county or of any royal, parliamentary, or police burgh shall be the local authority within the meaning of the provisions of this Act which relate to the rate of speed and the erection of danger boards; and
- (4) a reference to subsections one and three of section ninety-three of the Local Government (Scotland) Act, 1889, shall be substituted for a reference to subsections one and five of section eighty-seven of the Local Government Act, 1888; and
- (5) any fine under this Act shall be recoverable by imprisonment in terms of the Summary Jurisdiction Acts; and
- (6) any person convicted of an offence under this Act and ordered to be imprisoned without the option of a fine or adjudged to pay a fine exceeding ten pounds shall have a right of appeal against the conviction. Such appeal shall lie to the sheriff depute, and shall be heard summarily. Such appeal may be taken either immediately after the judgment appealed against has been pronounced or within seven days thereafter, and upon such appeal being taken the sentence (if any) shall be suspended until the appeal has been disposed of: Provided that the appellant shall, at the time of taking such appeal, lodge in the hands of the clerk of court a bond with sufficient cautioner or otherwise give security satisfactory to the court for appearing before the sheriff depute. The sheriff depute is hereby authorised and empowered on such appeal to hear evidence, whether led at the original hearing or not, and to reconsider the merits of the case and reverse or confirm in whole or in part the judgment appealed against, or give such new or different judgment as he in his discretion shall think fit; and save as provided by the Summary Prosecutions Appeals (Scotland) Act, 1875, his judgment shall be final and not subject to review; and
- (7) An appeal taken in terms of this Act by a person holding a license against an order for suspension or disqualification shall be taken and disposed of as nearly as may be in the manner and subject to the conditions provided by the immediately preceding subsection.

19. In the application of this Act to Ireland—

- (1) A reference to the Local Government Board for Ireland shall be substituted for a reference to the Local Government Board; and
- (2) Subsections one and three of article thirty-two of the Local Government (Application of Enactments) Order, 1898, shall be substituted for subsections one and five of section eighty-seven of the Local Government Act, 1888; and
- (3) Section twenty-three of the Summary Jurisdiction (Ireland) Act, 1851 (which gives a right of appeal), shall apply as respects convictions for offences under this Act as if any term of imprisonment without the option of a fine were substituted for a term of imprisonment exceeding one month; and
- (4) Sections one to four, inclusive, of the Criminal Evidence Act, 1898, shall extend to Ireland in the case of a person charged with any offence under this Act.

20.—(1) In this Act the expression "motor-car" has the same meaning as the expression "light locomotive" has in the principal Act, as amended by this Act, except that, for the purpose of the provisions of this Act with respect to the registration of motor-cars, the expression "motor-car" shall not include a vehicle drawn by a motor-car.

The provisions of this Act and of the principal Act shall apply in the case of a roadway to which the public are granted access in the same manner as they apply in the case of a public highway:

(2) This Act shall come into operation on the first day of January nineteen hundred and four.

(3) This Act may be cited as the Motor Car Act, 1903; and the Locomotives on Highways Act, 1896, and this Act may be cited together as the Motor Car Acts, 1896 and 1903.

21. This Act shall continue in force till the thirty-first day of December, nineteen hundred and six, and no longer, unless Parliament shall otherwise determine.

Where no alleged speed is given it is understood to be above the legal limit.

THE SPEED OF TRAMCARS.

At the West London Police Court, on Saturday, four drivers in the employment of the London United Electric Tramcar Company appeared to answer adjourned summonses taken out by Mr. Moffat Ford, for driving their cars at a speed exceeding the ten miles an hour limit laid down in the Board of Trade regulations. At the first hearing of the case it was contended that the Board of Trade were not empowered to make regulations as to speed, but Mr. Muir, for the company, at the second hearing stated that the defence raised no point of law. He said the tramway company could conclusively prove that none of the cars timed by the prosecutor could go at a greater speed than 13 miles an hour, and he suggested that an independent test might be made by an official of the Board of Trade for the benefit of the Court. The magistrate said the matter was important, and he thought the learned counsel's suggestion a good one. He adjourned the summonses in order that an official test might be arranged.

THE MIDLAND HILL CLIMB.

THE official results of the hill-climbing competition on Sun Rising Hill, on the 25th ult., have been declared as follows:—

	Entrant.	Net Time Secs.	Score.	Rate per Mile.
1	20-h.p. Napier (C. Edge)	115.8	599	17.664
2	10-h.p. Lanchester (J. V. Pugh)	265.8	854	7.695
3	10-h.p. Lanchester (A. Millership)	264.6	866	7.73
4	20-h.p. Wolseley (A. E. Crowdy)	165	913	12.395
5	20-h.p. M.M.C. (G. Iden)	141.8	955	14.425
6	10-h.p. Lanchester (F. W. Keen)	297.6	957	6.873
7	6½-h.p. Cadillac (F. S. Bennett)	252.8	962	8.091
8	10-h.p. Lanchester (C. V. Pugh)	307.6	972	6.649
9	15-h.p. Panhard (Hon. C. S. Rolla)	156.2	984	13.095
10	16-h.p. Lanchester (G. H. Lanchester)	194.4	1,028	10.521
11	16-h.p. Rochet (H. H. P. Deasy)	197.4	1,034	10.362
12	10-h.p. Lanchester (M. R. Lawrence)	308.6	1,039	6.628
13	12-h.p. Wolseley (H. Austin)	236.4	1,044	8.652
14	18-h.p. James & Browne (T. B. Browne)	177.6	1,057	11.517
15	22-h.p. Daimler (E. W. Lewis)	153.6	1,107	13.316
16	24-h.p. Panhard (J. A. Holder)	152	1,302	13.457
17	24-h.p. Wolseley	175.6	1,393	11.648

POLICE TRAPS.

ABOUT a mile out of Chorley, on the road to Preston, the police have a well-laid trap.

THERE is a trap in the town of Witney (Oxon), and another just outside on the Cheltenham road. Motorists, especially riders of motor cycles, should be careful.

THERE is a trap at Hook, just before reaching the fourth milestone on the Brighton road.

A two mile trap has been established between Martham and Somerton, and motorists caught thereon will be required to appear at the court-house at Rollesby.

THE Motor-Car Journal.

VOL. V.]

LONDON, SATURDAY, SEPTEMBER 5, 1903.

[No. 235.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE accommodation and housing of the automobile is an important factor in the upkeep of a motor-car, and the subject is one which offers scope for much ingenuity on the part of owners. Some few months ago we gave examples of what was being done in the United States, and now we invite our readers to make known their difficulties and how they

have been overcome. The practical experience of motorists will be useful to all who own cars, and the subject is one of value as well as of interest. In London and suburbs there are difficulties in the case of houses already built, and architects will do well to remember, in designing new houses and planning out new estates, the necessities of the modern man who owns a motor-car.

Changes in Long Acre.

WE have previously referred to the change wrought by the motor-car in what used to be the classic thoroughfare of the London carriage manufacturers—Long Acre. One hostelry there, the White Horse, though rebuilt latterly, long continued to have something of the genuine old Sam Wellerian ostler's tradition. But the London correspondent of the "Manchester Guardian" notices that a small swing-sign now projects from its doorway over the pavement with the significant legend—"Rendezvous des Automobilistes." In this the London publican is following the example of the gentleman at Kilcullen, who, during the Irish Automobile Fortnight, re-christened his house "Flanagan's Motor Bar."

Motor Mails Wanted.

IN the Whitehaven district, the question of the delivery of mails has assumed the importance of public discussion, and, at the last meeting of some local councils, reference was made to the inconvenience of the postal service between Egremont and Frizlington. According to many of the councillors, the only solution is to provide motor vehicles in place of horse-drawn vans, and a resolution to that effect has been approved, authorising a letter to the Postmaster-General, asking that a motor mail may be substituted for the present system of carrying postal parcels to the places we have named.

Have the Money Ready.

OWNERS of motor-cars who are unrepresented at the hearing of cases of alleged furious driving run the risk of the summonses being adjourned, thus causing annoyance and inconvenience. Latterly many owners have sent their servants to represent them, recognising full well the difficulty of securing a dismissal, even if they have a solicitor to plead.

In such cases they should take care that they supply their representatives with plenty of spare money with which to pay any fines that may be inflicted. The other day M. Henri Damoulu, of Lancaster-gate, who was summoned at Beaconsfield for travelling twenty miles an hour, was fined £3 and costs. He sent a servant to represent him, but as the latter had no money to pay the penalty, he was kept in the guard room at the police station until it arrived by telegraph.

Motor-Car Legislation in India.

THE following announcement has just been issued by the Acting Secretary to the Government of Bombay:—"An application has been received by Government from certain gentlemen proposing to get up a company for a motor-car service between Poona and Mahableshwar, and having regard to the large initial expenditure to be incurred, asking for a guarantee to secure them from the competition of other motor-car companies for a limited number of years on terms to be agreed on as to the fares to be charged and conditions to be observed. The promoters have been informed that under the present law no guarantee can be given, but the Government hope to legislate shortly on the subject, after which their application will be disposed of. The Bill for the Control of Motor-cars will, it is hoped, be laid before the Legislative Council before the end of the current year."

An Inquiry.

AT the time of the Gordon Bennett race we, in common with other newspapers, were seriously handicapped by the breakdown in the telegraphic arrangements for the transmission of messages from Ballyshannon to London. Private inquiries by our correspondent in Dublin elicited that the delay was probably due to undermanning in the Irish capital. Anyhow, the matter was so serious as to cause Mr. Austen Chamberlain to promise an inquiry into the whole subject. The report of the experts appointed for the purpose has now been submitted to the Postmaster-General, who has completely exonerated the special staff at Ballyshannon from all blame and responsibility in the matter. This seems the usual procedure in connection with official inquiries into departmental disorganisation. But to exonerate the staff at Ballyshannon does not at all deal with the cause of the delay. That there were delays was undoubted, and the inquiry should have concerned itself with finding out where they occurred, rather than select one particular spot, and tell us that those there stationed were not at all to blame in the business.

Closing the Roads.

A FORTNIGHT ago we referred to the fact that the Hampshire County Council was beginning to move in the direction of obtaining a list of roads to be recommended to the Local Government Board as unsuitable for automobile traffic. The Isle of Wight County Council is now similarly concerning itself within the area of its jurisdiction, and at the other end of the

country, namely in Inverness-shire, the local Farmers' Society is writing to the local County Council, saying that they will support any action which might be taken by that body for the purpose of scheduling such roads as might be declared unfit for motor-car traffic. We mention this as typical of the anxiety of local authorities and anti-motorists to get quickly to work, and also with the idea of impressing upon those who drive, the necessity of being extremely careful not to do anything to unnecessarily irritate local public opinion.

Why not a Legal Limit on this Sort of Thing?

Irritating the Public.

THIS is a matter which it would seem cannot be too frequently mentioned, for the bad conduct of one or two motorists has been sufficient to bring the whole body of drivers into disrepute. A piece of incivility on the part of a motorist driving through the Welbeck estate has recently led the Duke of Portland to close the roads on his property in that district to motorists. While all will regret this decision, none will feel that His Grace has been acting hastily or without cause, for he has always shown himself a real sportsman, and naturally feels indignant that he should have been insulted in his own grounds. Away in the Potteries, too, another motorist, hurtling along the highway at thirty miles an hour, came into collision with a flock of sheep, killing three of them. Although he gave, it is alleged, the wrong name and address, the police were able to take him to the Court, with the result that he was fined £10 and costs; none too light a penalty in view of the bad effect such conduct must have upon public opinion.

Mean Motorists.

A SIMILAR case of bad form on the part of a motorist is reported to us by the Mohawk Motor Company, of Chalk Farm, N.W. The other day they were driving a 9-h.p. De Dion car, and as the driver of a 12-h.p. Darracq in front was going slowly, they passed him. He let them get a good bit ahead, and then passed at a higher speed. They were glad to hang back to avoid the dust; a few miles further on they again passed him, as he was hung up for a roadside repair. They had perhaps gone three or four miles when he passed again at about thirty miles an hour. Not content with this, he pulled up now and again, so as to keep them in his dust all the time. They again hung back to avoid it, when suddenly the dust ceased, and on coming up it was found he had been stopped by the police, and, as they thought, had been trapped. When their car came up, and the police wanted their name and address as well, this Sportsman (?) got out of his car, and said the De Dion driver had been having a game with him, although it was the other way about. The inspector came up on a bicycle, told the police to let the first red car go, detaining the Mohawk red car. This type of mean motorist would be well off the road without the

option of a fine, which doubtless the Mohawk Company will have to pay in the course of a few days.

The Reliability Trials.

ELSEWHERE we publish the list of entries for the Automobile Club Trials. There is a total of seventy-six British cars, compared with forty-one in 1902; the increase of foreign cars being from forty-three to only fifty-nine. Thus it will be seen that the British increase is 85 per cent., while that of the foreign entries is only 37 per cent. There is a net increase of sixteen in the number of British firms in the list of competitors, which is in itself a strong argument against too stringent administration of the law. The principal increase is in cars costing under £400, the annual upkeep of which should certainly not, in the opinion of the Club, exceed £50 per annum, and of this type upwards of fifty cars are entered for the trials. Out of a total of 140 entries, only ten are steam cars. A noticeable fact in connection with the largely increased list of entries is that the foregoing summary takes no note whatever of motor-bicycles. The rapid development of the "poor man's horse" is forcibly brought out by the fact that the Club found it necessary this year to remove the motor-cycles from among the cars and to organise an entirely separate series of trials, a course which found full justification in an increase of from four cycles in 1902 to no less than forty-eight in the present year.

Why Gordon-Bennett?

STILL the words Gordon Bennett appear in the newspapers, echoes of the great race in Ireland in July being heard from every quarter. It is strange that the hyphen should have crept into a name which has become memorable in the annals of automobilism as well as of the newspaper press. Mr. James Gordon Bennett has not yet, however, become the possessor of a double-barrelled cognomen, despite the persistency of some contemporaries in jointing up his Christian with his surname.

Mr. J. T. Overton on his Georges Richard Car in Dublin.

The Manufacture of Convictions.

WHEN boys go out to lay traps for birds, they catch all the birds they possibly can, and they go with the intention of catching them. Precisely the same thing happens when the boys are policemen and the birds are motorists; they trap every motor-car that comes along.

Messrs. Firth and Co. call our attention to two cases which should be exposed, which we cannot do better than in their own words. In the first case, a motorist was caught in the police trap at Bagshot. The police sergeant swore that the car had covered one-fifth of a mile in thirty-eight seconds, and ostentatiously put a cheap stop watch in the driver's face to prove what he said. As the automobilists knew this to be incorrect, one of them asked him if he set the stop watch at thirty-eight seconds overnight, or before he came out in the morning. He was also asked if anyone saw him start the watch or stop it. It was obvious to those in the car that the stop watch was used solely to give materiality to the sergeant's evidence. The Chertsey Bench, however, were so satisfied that the police evidence was false that they dismissed the case.

Another Case.

IN the second case, at Gillingham, in Dorset, the police made provision for a crusade against motor-cars. A gentleman was driving from Gillingham to his country seat. Passing out of the town there is a very sharp bend over the railway bridge, which necessitates any driver, for his own safety, slowing down to considerably under twelve miles an hour. The

yards away, but he further stated that he was between the police and the children. He also contradicted the statement by the police when they said they got the children off the road, and he also said there were only two or three, not seven or eight, and that none of them were in danger, as they had plenty of time to get on to the path, but he was so well versed in the speed question that he still stuck to his thirty miles an hour.

Contradictory Evidence.

A WITNESS was then called who sat on a wagon, the driver of which had given him a friendly lift, and he stated that the car was going at thirty miles an hour, and that his friend, who was driving, gave a jump and pulled the horses almost into a ditch in consequence of the speed of the motor. This evidence, like the rest, was collected by the police and was given by an inhabitant of the district. On cross-examination, however, it appeared that the jump was not a jump at all, but that the only thing he did was, in consequence of his horses being in the middle of the road and taking up the whole of the highway, to pick up his reins and pull his horses on to his proper side, and it was elicited that he had plenty of time to get his wagon out of the way before the car came by, and that it passed without inter-

[Argent Archer.

motorist was summoned for driving to the danger of passengers on the highway. The police constable was first called, who stated he was in company with a sergeant, and heard a motor-car coming behind from Gillingham; that there were seven or eight children playing in the road in front of them who evidently did not hear the car coming until he and the officer with him shouted to them and took steps to get them off the road, upon which the children ran on to the green on the opposite side of the road, and instantly the car passed by the children and the policemen, going at a furious rate, which he estimated at thirty miles an hour; he also stated that at the time there was a baker's cart, a wagon, and two horses, and several vehicles, cyclists, and foot passengers on the road. He stated that at the time he was only two or three yards from the children, which enabled him to get them off the road, and if he had not been there they must have all been killed. A police sergeant having corroborated, the driver of the baker's cart stated he was not in his cart, but that his pony and cart were standing on the side of the road, and he admitted that he had been serving bread at a house, and that his pony was unattended, but that it took no notice of the car, which passed at a speed which he also unhesitatingly fixed at thirty miles an hour precisely. He swore that he himself was near the children, and that the policemen were about 300 yards away; when he was pressed, however, in favour of the police, and they endeavoured to alter this statement, they could only get him to alter it to 200

fering with his horses one way or the other, and the driver never moved from his seat, which was on the shafts of the wagon. All the witnesses swore that the speed was thirty miles an hour, when, in fact, it was under twelve. The defendant, and a gentleman with him on the car, gave evidence that at the time and place in question they were not going more than ten or eleven miles an hour, as they had only just stopped at a shop in the town, the streets of which were busy, that they had to go over the bridge, and that immediately they turned the corner they came in sight of the policemen who gave evidence in the case, and—withstanding this evidence, and notwithstanding the fact that the evidence of the prosecution proved, out of their own witnesses' mouths, that the tale of the children had been so unsatisfactorily given—there were a minority of the magistrates who desired to convict, but happily it was not a Kingston, Reigate, Huntingdon, or Horsham bench, and the case was dismissed.

New London Motor Omnibus Service.

IN our last issue we mentioned that the motor omnibus service between Oxford Circus and Cricklewood had ceased running. The vehicles have been acquired by the London Power Omnibus Company, who are building an extensive garage and central depot and offices at Salisbury Road, Kilburn.

The building is already well advanced, and is expected to be ready for occupancy in about six weeks' time. The depot is designed for the accommodation of fifty motor omnibuses, all on the street level. The upper floor will be occupied as offices, mechanics' shops and store. On the same floor a section has been set apart for the "living in" of a staff of over fifty men. There are two distinct entrances to the depot. Omnibuses will leave by the front entrance, and return by the side gateway which leads to the yard and washing court. Without further handling they will pass on to the inspection department, where the vehicles will be thoroughly overlooked and lubricated, thence they will pass on to the departure gangway. The first route to be served by the company will be from Salisbury Road or Queen's Park Station, via Brondesbury Road, to Kilburn Station, thence direct to Marble Arch. A commencement will be made with a ten minutes' service, to be increased, morning and evening, to a five minutes' service. In the first instance only Stirling single-deck omnibuses, to seat twelve and fourteen passengers each, will be started, to be followed before the end of the year with the new Stirling double-decked omnibuses to carry twenty-eight passengers.

Motor-Boat Races.

THE first really important race for motor-boats began last Sunday morning. Hitherto races of this kind have been single day events over a comparatively short course, but in this case the course is from Paris to Trouville down the Seine, and six days will be occupied in completing the journey, so that not only the speed but also the staying power of the competing boats will be taken into account. The total distance is 302 kilometres (188 miles), the longest lap being on the second day from Mantes to Saint-Aubin, 109 kilometres (68 miles). There were sixteen starters. The Mercedes boat, with a 35-h.p. motor, led the way the whole of the first day and did the best time by more than half-an-hour.

'Buses for Beverley.

FOLLOWING on the information already given with regard to the development of a motor-'bus service by the Great Western Railway comes the news that the three motor-omnibuses which the North-Eastern Railway Company have had constructed by Messrs. Stirlings (Limited), for the conveyance of passengers between Beverley and North Frodingham, have been severely tested during last week in Edinburgh. The vehicles, which will each carry sixteen passengers, with half a ton or more of luggage on the roof, are driven by petrol motors of 24-h.p. They have been run on the steep and rough streets of Edinburgh for a week by the officials of the North-Eastern Railway, besides which several long non-stop runs were made into hilly parts of the country. The streets on the north side of the city, where grades of 1 in 10, 1 in 12, 1 in 14, and the like, can be found for long distances, afforded interesting experiments, including the feat of running up Pitt Street and Hanover Street on the top speed all the way; and brake and "stop and start" trials gave good results on the 1 in 6 grade at Trinity. To finish the tests on the last day a rapid run was made to Linlithgow in a gale of wind and on muddy roads. The trials were so satisfactory that the railway company decided to put the cars into service at once.

A Successful Trip.

ON Monday the 'buses arrived at Beverley. Two were taken direct by rail, and the third travelled by road from York, conveying Mr. Gibb, the general manager of the North-Eastern Railway Company; Mr. Raven, the locomotive engineer; Mr. Burt, traffic superintendent, and other officials, who, after inspecting the cars and the stable in which they are to be kept, returned to York by train. During the process of detraining, the cars were backed up a steep incline, the power of the motor being well tested. They were then run to the shed in which they are to be housed, and which has been specially

fitted up for their accommodation. During the afternoon the three cars were taken on a trial journey to Beeford and back. Hull Bridge was the first stopping-place, and calls were made, with a view to the preparation of a time table, at the post offices in the villages of Tickton, Routh, Leven, Brandesburton, North Frodingham, and Beeford. When it is mentioned that many of the inhabitants in these isolated villages, especially North Frodingham and Beeford, have never seen a railway engine, it can readily be imagined that they viewed with amazement these automobiles. An average speed of about twelve miles an hour was maintained throughout the journey. According to present arrangements four journeys will be made daily in each direction.

Filling Tanks.

ARRANGEMENTS for this year's Trials are progressing rapidly. Mr. S. F. Edge will again act as honorary marshal and Mr. J. D. Siddeley as hon. secretary for observers. The question of special tanks for replenishing cars has been reconsidered, and it has been decided that no mechanical means shall be used, but that all petrol cars shall be filled from recognised two-gallon tins, the petrol being poured out in the ordinary way; and that cars using petrol may use certified drums holding up to ten gallons. In this connection it has been also decided that no car may be replenished while in the Storage Tent, but that the cars must be taken to a special part of the grounds set apart for them and numbered, where all replenishments must be made.

A New Black List.

A MEMBER of the A.C.G.B.I. has reported a number of disgraceful acts on the part of his mechanic, whom he had obtained through the Club register. The register has only been in operation for some twelve months, and, of course, the record of the various men on it is not yet completely filled. A number of men have already been "blacklisted," and in course of time there is no doubt the bad ones will be weeded out. During the period of transition there are bound to be difficulties, and members are officially requested to notify Mr. Basil Joy in the event of their having any trouble with their mechanics, in order that others may be put on their guard. Such letters will be treated in absolute confidence as far as members' names are concerned. Members are strongly recommended to apply to the Technical Secretary for information as to any motor servant whom they may propose to engage, as it is quite possible that there may be some record in the books against the man, and this, of course, would be placed at the disposal of the member.

LIEUT.-COL. SIR AUDLEY NEELD, of Chippenham, Wilts, has just acquired a 7½-h.p. Wolseley car.

THE Anglian Motor Company, Limited, has been registered with a capital of £10,000 and headquarters at Beccles.

THE Mid-European Motor-Car Union, of Berlin, is organising a competition of speed indicators for use on automobiles.

MOTORISTS going from Brighton to Worthing on Sunday will do well to look out for a police trap between the Half Brick Inn and Worthing.

THE 10-h.p. Panhard belonging to Professor Herkomer, illustrated in our last issue, was supplied by the British Automobile Commercial Syndicate.

THE Lancashire Steam Motor Company, Limited, has been registered with a capital of £50,000, the first directors being Messrs. H. Spurrier, sen., J.P., A. Spurrier and H. Spurrier, jun.

THE Great North of Scotland Railway is contemplating the inauguration of services of motor carriages to supplement the suburban train services, and also to connect outlying districts with the railway.

IN addition to the cases of alleged furious driving reported on another page, the Hon. R. Ward has been fined 40s. and costs for exceeding 12 miles an hour in Hyde Park, and Mr. Lionel de Rothschild has been fined £5 and costs at Barnet for driving a car at excessive speed on the Great North Road.

THE DENNIS 16-20-H.P. CAR.

—■—

COMMENCING with motor-cycles some years ago, Messrs. Dennis Bros., Limited, of Guildford, have steadily kept pace with the progress of the automobile movement. Year by year their works have been extended, and we now learn that as a result of the growing demand plans have been passed for a further extension, which, when completed, will enable the output to reach over twelve cars a week.

We are able this week to illustrate in plan the chassis of the 16-20-h.p. four-cylinder car, with which Messrs. Dennis are now meeting with considerable success. As will be seen, it is built on up-to-date lines in every respect. The false frame holding the engine, clutch, and gear box is built of channel section steel, with specially constructed fasteners at the ends, and strengthened with side supports from the main framework. The latter is constructed of steel,

universal joint attached to a tubular arbor shaft, which has at its rearmost end a cardan joint, transmitting the power to a spindle carrying the bevel pinion, which transmits the power to the rear live axle. The differential is of the spur type, but differing from the usual kind by having six small spur wheels which greatly add to the strength.

The bearings of the rear axle are also noteworthy, the axle being mounted on four rows of half-inch ball bearings, together with four plain ones of phosphor bronze. The latter, being an easy fit, take all the bearing in case a ball should break or the ball races wear. The rear brakes are cast iron discs expanding against drums on the wheels. They are double acting, and are applied by a lever at the side of the driver. The wheels are all of equal size, the standard being 32 in. dia., shod with $3\frac{1}{2}$ in. pneumatic tyres. The petrol tank, which is fitted with a sight indicator, is placed in the front of the dash board, and holds nine gallons of spirit. The dash board is curved inwards at the top, and has affixed to it an automatic lubricator, under

Fig 1.—Plan of Dennis 16-20-h.p. car.

supported with ash and cross-stayed with channel steel, while the rear and front hangers extend well beyond, allowing the use of long and easy riding springs. The engine is of the four-cylinder vertical type, developing 16-h.p. at the normal speed of 950 revolutions per min. or 20-h.p. if accelerated. The engine is cooled by means of a honeycomb radiator aided by a suction fan worked by a gut band off the main engine shaft. In construction the radiator is similar to a tubular boiler, the copper tubes being rivetted at each end, so that it can be easily repaired in case of a leak.

The conical-shape clutch is bolted to the flywheel of the engine, and released by two hardened steel rollers, brought into action by the depression of the pedal. The gear box, which gives three forward speeds and a reverse with a direct drive on the top speed, is an ingenious piece of mechanism, inasmuch as it carries two extended disengaging dogs on the sliding gear which releases the secondary shaft, when running on the top speed. The main and second shaft are placed side by side and hardened steel bearings are used throughout instead of phosphor bronze. At the rear of the gear box is attached a large drum of large diameter, which is encircled by a phosphor bronze casting clipped against the drum on the depression of the brake pedal, the brake acting equally well whether the car is running in a forward or backward direction. The phosphor bronze ring is made from one casting, and the spring of the metal ensures its clearing the drum at an equal distance when released. In conjunction with the brake drum is a covered-in

pressure, which lubricates every bearing in the car, volt-meter, water pressure gauge, 2-way switch, and induction coil.

A NEW work on Motor-Car Management is shortly to be published by Messrs. Constable and Co.

BOTH in America and this country several old churches and fire stations have been converted into motor-car garages. Now comes the news that a theatre at Salem, Mass., U.S.A., is in future to be used as an automobile depot and repair shop.

ALTHOUGH the Bristol Motor Co., of Victoria Street, Bristol, has been established five years, their first annual outing did not take place until Saturday last, the destination being Bournemouth. A steamer trip round the Isle of Wight was also enjoyed.

MR. T. H. PRESTON sends us the following from Brantford, Ont., which he suggests may be of service to automobilists who contemplate a Canadian tour:—"The license fee for automobiles charged by the Ontario Government will be 2 dols. per machine for registration, and 1 dol. per annum afterward. Besides this, 1 dol. will be charged for the tag, which must be conspicuously displayed on the vehicle. The tag decided on is a dark leather shield six or seven inches long, with raised aluminium figures, and bearing the coat of arms, and words, 'Licensed by the Province of Ontario.' Tourists must procure one of these tags, and on leaving the 1 dol. charged for it will be returned."

D

SOUTH AFRICAN NEWS.

[FROM OUR OWN CORRESPONDENT.]

CAPE TOWN, August 12th.

I HAVE pleasure in sending this week a batch of interesting photos, taken during an electioneering campaign trip of 900 miles through Griqualand, when Mr. Abe Bailey, M.L.A., was canvassing for his seat. No. 1 shows the car on the way to Griquatown, waiting for the ferry across the Vaal River at Smith's Drift. Leaning on the car is Major C. E. Owen-Lewis, Secretary of the Progressive Association, who accompanied Mr. Bailey on the trip, and in the foreground is Mr. J. Solomon, a prominent merchant of Kimberley. No. 2 depicts the car crossing the same ferry on the return journey, with Mr. O. E. Bush at the helm, and three Dutch sons of the veldt on a motor-car for

Snapshots taken during a South African Election Campaign.

the first time in their lives. No. 3 shows the same car at a Kaffir Kraal near Campbell, Griqualand. A Dutch farmer and his family are seated in the car, and in the rear can be seen a number of Kaffirs. In No. 4 the car is seen coming up Du Toit's Pan road, Kimberley, on the return journey, after the 900 mile trip.

On Saturday, the 8th August, the Automobile Club of South Africa, having awakened from its winter sleep, took advantage of Dr. Jameson's hospitality and ran through mud and slush to "Groot Schuur." Over twenty cars left Greenmarket Square at 2.30 p.m., while others joined the meet at the rendezvous. The following is a fairly complete list of the cars present:—

Dr. L. S. Jameson ...	22-h.p. Daimler
D. P. de v. Graaff ...	22-h.p. Daimler
A. T. Hennessy ...	14-h.p. New Orleans
Donald Menzies ...	12-h.p. Gladiator
A. C. Partridge ...	10-h.p. Lancheester

S. H. Adams ...	10-h.p. Lancheester
S. H. Adams (driven by Pippard) ...	10-h.p. Wolseley
H. Breusing ...	10-h.p. Wolseley
J. Klerck ...	8-h.p. Belgian Car
W. M. Jenkins ...	Toledo Steam Car
A. S. Wessels ...	Toledo Steam Car
W. E. Toll ...	Conrad Steam Car

His Excellency, Sir Walter Hely-Hutchinson, G.C.M.G., the Honorary President of the Club, was to have arrived at "Groot Schuur" at 3 p.m. on Mr. Graaff's Daimler, but while taking one of the up-grades on the Estate road the machinery went on strike, and the Chairman, Mr. A. T. Hennessy, had to bring up his New Orleans to the rescue and convey His Excellency to the assembly. The last half mile of the run (from the Main Estate road to "Groot Schuur" itself) imposed a very good test of brake-power—the grade being in places about 1 in 6—but all the cars successfully negotiated the same with the exception of Mr. Edwards' Pan-

hard. Finding that there was some defect in the brake, Mr. Edwards called in the assistance of the wire fencing at the side of the road—sacrificing his glass front in the manoeuvre, but otherwise doing no damage. A very enjoyable half-hour was then spent refreshing on the historic stoep, among familiar faces being Dr. L. S. Jameson, M.L.A., His Worship the Mayor (and of course the Town Clerk), Sir David Gill, the Attorney-General, Colonel Robinson and Mr. H. M. Arderne, with a large number of club members and friends.

Refreshments over, the cars were then taken to the Main Estate road, where a mile had been measured off for speed trials, and one by one the competing cars were despatched by Mr. J. Rose, who, with the honorary secretary, Mr. Fuller, was responsible for the timing. His Excellency, who was driven over the course in the Chairman's car, watched the proceedings from the finishing point, and evinced much interest in the times made by the various cars. A telephone had been specially installed for checking the time—the starting signal being clearly heard at the finishing point and stop watches at each end verified all times taken. The best run was made by Dr. Jameson's 22-h.p. Daimler, the time being 1 min. 47 1-5 sec. (35.7 miles per hour).

Fig. 1.—General View.

Fig. 2.—Details of Floor.

Mr. Graaff's 22-h.p. Daimler having recovered from its temporary indisposition, secured next place with 1 min. 43 1-5 sec. (34.8 miles per hour). Mr. Menzies' 12-h.p. Gladiator followed with 1 min. 47 1-5 sec. (33.7 miles per hour). Mr. Partridge's Lanchester showed up well with 1 min. 55 2-5 sec. (31.2 miles per hour.) The remainder of the competitors averaged about 2 min. 25 sec., or 25 miles per hour.

The only mishap during the trials occurred to Mr. White's Oldsmobile, which shed one of its front wheels after running down a steep incline about half a mile from the start. The car turned turtle and dislocated the driver's ankle, but the engine continued running until the current was switched off, the only damage being a bent axle and twisted springs. Some time was occupied in ascertaining the details of the accident at the telephone stations, and as dusk was approaching it was thought best to close the afternoon without allowing the flying start tests to be made. On the whole the Club is to be congratulated on the very satisfactory turn out. Events of this sort are of very great use to the public in enabling the uninitiated to judge of the merits of the various cars and in showing up the weak and strong points of all.

MOTOR-CAR HOUSES.

IN recent issues references have been made to the problem of motor-car houses. House agents are recognising that the addition of suitable buildings for the accommodation of automobiles is a valuable asset in the letting of premises in their hands, while the country gentleman recently converted to the new movement wants to have some idea as to the cost of housing his vehicle.

We recently went into the question with the proprietors of the London Steam Joinery Works, and with their assistance are able to give a plan of a shed which has the advantage of being easily transportable as well as eminently useful and practical when fixed in position. The house is in interchangeable sections, so that it can be taken down, packed in small compass and readily taken to any other location and re-erected. In the house shown in Fig. 1 the windows are at the sides, but they can be as easily placed as skylights, thus securing the maximum of light for the interior. Fig. 3 shows the elevation of the side of the house which does not appear in Fig. 1, while a plan view is given in Fig. 4. Arrangements have been made for adequate pit accommodation and for the provision of tool bench, wardrobe cupboard, tool sack, etc. A shed of this kind 21 ft. by 12 ft. by

Fig. 3.—Side Elevation.

Fig. 4.—Plan.

8 ft. high to eaves, with doors at each end and granolithic floor, would probably cost about £82. This would include channel and fall to carry off the water, and the pit being formed with granolithic slabs blocked together so that they could not move. A reduction of nine feet in the length of the shed would result in lowering the cost about £10, while the omission of the granolithic floor and pit would effect a saving of about £20.

Constructed on this system of interchangeable sections, the cost of motor-car sheds can be reckoned at about 7s. per foot super of floor space with the granolithic floor, or 5s. per foot super of floor space if such is omitted. The provision of motor-car sheds is one of the matters that motorists have to attend to, and it is becoming increasingly apparent that those who have their own houses can effect economy in the pursuit of their pastime.

To rent a shed is generally unsatisfactory; there is the heavy expense, and it cannot always be obtained near the house of the owner of the car. But the man in the suburbs who has a garden of good size with adequate side or back entrance can easily devise a house of effective appearance in which to accommodate his automobile. The foregoing estimates may afford some basis for useful comparisons.

THE DE DION PUBLIC SERVICE VEHICLE.

MESSRS. DE DION AND BOUTON have until recently built commercial vehicles driven by steam, comprising a multi-tubular boiler of special construction and a compound engine. For some time, however, they seem to have abandoned steam and taken up petrol instead. After having for years made vehicles of large capacity and great load, they have now turned their attention to delivery cars for moderate loads and capable of higher speed, which are demanded by merchants and manufacturers, and also to public-service vehicles. Our illustration shows one of the latter, having accommodation for twelve passengers, eight inside and four on the platform. It is fitted with a 15-h.p. two-cylinder motor, and a three-speed transmission gear. The slowest speed is $2\frac{1}{2}$ miles, the medium 5.6 miles, and the high 14 miles per hour. The weight of the

omnibus, empty, is about $26\frac{1}{2}$ cwt. The wheel base is 8 ft. 2 in., and the total length 15 ft. 10 in. The track is 4 ft. 10 in. and the width of the platform 4 ft. The front wheels are 32 in. in diameter and the rear wheels 36 inches, all being shod with solid rubber tyres.

A SCOTTISH Cyclists' Union warning board is to be erected near the new railway bridge, at a nasty turn which leads on to the new extension of Dundee's esplanade.

THE Wolseley Tool and Motor-Car Co., Limited, have appointed Messrs. Dangar, Gedge and Co., of Sydney, agents for Wolseley cars in New South Wales, and Messrs. Levin and Co., of Wellington, for New Zealand.

A SPEED indicator and recorder for motor vehicles has been introduced by a Dresden firm. Besides indicating the speed, the instrument shows how long the vehicle has been stationary, and rings a bell when the speed limit has been reached.

UP to the end of July the total number of automobile licences issued in Cleveland, U.S.A., was 919. This is an increase of 550 for the past twelve months—a good indication of the rapidity with which motor-vehicles are growing in public favour.

A MOTOR-DRIVEN hack saw has just been put on the market by Messrs. Edward G. Herbert, Limited, of Cornbrook Park Works, Manchester. Owing to the eccentric motion these machines are claimed to cut much quicker than an ordinary hack saw.

ACCORDING to a Consular report, motor-cars, though not used to such an extent as in other European capitals, are increasing in demand at St. Petersburg. German, French and Belgian makers supply nearly all the local requirements, and there seems to be no reason why British manufacturers should not join in the competition for supplying them.

MR. E. H. LANCASTER, who for nearly two years has been the expert to the Automobile Club, has resigned his position with that organisation. His knowledge of automobilism is probably unique, and his varied experience should serve him in good stead in the new work he proposes to undertake, of which we shall give further details in an early issue. His successor at the Club is Mr. F. W. Hudlass, late of Messrs. Weller Brothers.

CONTINENTAL NOTES.

By "AUTOMAN."

IT is said on good authority that the course for the Gordon Bennett Cup race for 1904 has been definitely fixed, and that it is situated near Homburg. The Emperor of Germany, it is rumoured, has been interesting himself personally in the question, and has had much to do with the decision which has been taken. It is also said that he will be present on the occasion of the race, which will be held in the month of July—that is to say, in the height of the Homburg season.

THE burgomaster of Brussels, M. De Mot, has been making Dogberry bye-laws directed against automobilists circulating in the capital city of Belgium. The decree has gone forth that in certain streets motor-cars shall only circulate at the pace at which a man walks. He is, however, getting himself into trouble with the working man, and this is a thing he entirely overlooked in his anxiety to worry and persecute the users of mechanically-propelled vehicles. The Federation of Metallurgists called together the delegates of the different works around Brussels where automobiles are manufactured, or where parts of motor-cars are made, and two hundred working men turned out to denounce the mayor. Already there is a tendency for manufacturers to remove their works to the country, where rent and wages are cheaper, and efforts are being made by artisans' societies to encourage as much as possible the automobile industry which has taken root in Brussels. M. de Mot has therefore fallen foul of a very powerful body, and when he comes back from his summer holidays he will very probably find it wiser to withdraw his obnoxious bye-laws and cease a campaign of motorphobia which only tends to injure the trade of the city over whose destinies he presides.

SPEAKING of Brussels reminds me that quite a novel use is being made there of the horseless carriage. One of the banks of that city has chartered a motor-car to accommodate the individual who collects its accounts. The car has a limousine body which is fitted up with cash drawers and files.

IN every country the replacement of the old *regime* by the new is a slow process; it is, however, a sure one, and little by little the automobile is gaining ground and making itself indispensable in the routine of daily life. Switzerland, surrounded by mountains, indeed made up of mountains inaccessible in the winter and inhabited principally by peasants, has been one of the slowest countries to recognise the new locomotion—even yet many cantons do not tolerate motor-cars on their roads. The useful side of the question, which touches directly the pocket, is, however, prevailing, and so successful have the experiments with large passenger vehicles been, that they are gradually replacing the old diligence for the transport of passengers and their luggage to spots which the railway does not reach. In a few short years the diligence will be a thing of the past.

A PECULIAR accident happened to some friends of mine last Sunday as they were returning in a motor-car from an excursion to Fontainebleau. The day was hot and punctures abounded; indeed, the luck had been against them, and a "burst" followed close on the heels of a puncture. At Villeneuve-Saint-George they were fortunate enough to find a spare cover, and they were "romping" home joyful and hungry down the Avenue des Gobelins, when the clattering noise of the brake announced another puncture. The last spare tube had been used up, and there was nothing for it but to crawl for the last mile or two on the punctured tyre along the wood-paved Boulevard du Port Royal and down the Boulevard Saint Michel. All went apparently smoothly until the "setts" were reached, when a peculiar noise at once attracted attention, and the car was brought to a standstill. To the amazement of the five occupants, the complete tyre, outer cover, inner tube and all, had disappeared and left the bare rim, and was nowhere to be found.

TALKING about Fointainebleau, there have been some interesting trials of dust prevention along the road from Paris. Tar is the substance used for this purpose, and the experiments have had a great measure of success. At one spot a distance of 300 metres has stood three months and is in just as good a state now as when first laid down, although it was laid on an old road surface, and the season has been prolific in rain.

A HILL-CLIMBING trial will be held at Chateau-Thierry on October 4th next, under the auspices of the "Auto," who are making the most stringent regulations in order to preclude any possibility of accident. The necessary authorization has been granted by the municipal and prefectural authorities. The trial will be held on the same hill as last year, but only on the straight part of the road. It will be made with a standing start, and five seconds will be allowed after the word "go" until the competing car breaks the wire which starts the chronometer. Should the car not break it within these five seconds the timekeeper will break it himself and will begin to count the time. There will be the usual four classes for racing cars and motor-cycles and eight classes for the tourist section, namely:—(1) Motor-cycles which have taken part in the "Criterium of $\frac{1}{4}$ litre." (2) Cars whose chassis costs less than £160. (3) Cars whose chassis costs more than £160 and less than £320. (4) Cars whose chassis costs more than £320 and less than £480. (5) Cars whose chassis

A Benz Parsifal Car, at Seefeld, in the Tyrol.

costs more than £480 and less than £720. (6) Cars whose chassis costs more than £720 and less than £1,000. (7) Cars whose chassis costs more than £1,000. (8) Omnibuses carrying at least twelve passengers.

THE Chateau de Compiègne contains at the present time one of the most complete collections of tapestry and furniture extant, and is most interesting in souvenirs of the Empire. It is situated on the north-west corner of the forest of the same name, and is 95 kilometres (59 miles) from Paris. In order to reach it by automobile the tourist can take the route I indicated last week as far as Gouvieux, that is to say nearly at Chantilly. At Gouvieux, instead of leaving the town and going eastward, take the winding streets leading towards the north and make for Chaumont and La Chaussée, and thence by St. Maximin and Les Haies to Creil, which is an important commercial centre on the river Oise, which you keep on your left. When you arrive at the church in Creil, which is an easy landmark, ask the road to Beaurepaire, which skirts the river. After passing Beaurepaire you reach Pont St. Maxence, and when you arrive at the principal street turn sharp to the left along the *parée* and cross the river and the railway line, then straight on till you cross a quaint village with a wide street and grass side walks, about a mile or so from the bridges. Just after the end of this village, which is called Longeau, turn sharp to the right and pass through Houdancourt, Chevières and Rivecourt,

where you strike the road to Compiègne and turn to your left, skirting the river which you see from time to time on the right. Armancourt and Jaux are then passed through and you quickly find yourself in Compiègne, where you again cross the river Oise and climb up the hilly main street to the Hotel de la Cloche, next the town hall. The Chateau is a little further along and down to the left.

THE race meeting organised by the Frankfort Automobile Club took place on the trotting track at Frankfort-am-Main, on Sunday last. The three-mile motor-cycle race was won by Philtiens on a 3-h.p. Antoine, in 4 min. 44 sec., F. Opel on a Darracq won the race for cars up to 10-h.p. driven by professionals, covering the distance of five miles in 8 min., an amateur event in the same category being won by A. Ricordi on a Benz in 7 min. 42 3-5 sec. F. Opel on his Darracq won the five-mile handicap race reserved for members of the F.A.C. (3,585 metres start, time 4 min. 50 1-5 sec. An Adler car secured the first place in the amateurs' race for vehicles up to 16-h.p., distance eight miles, time 12 min. 5 3-5 sec., the professional event in the same category falling to the lot of F. Opel, time 11 min. 9 1-5 sec. There were seven entries for the amateur ten-mile race for cars up to 60-h.p., W. Poëge on his Mercedes winning in 12 min. 55 1-5 sec., Beconnais on a 35-h.p. Darracq carrying off the honours in the professional event over the same distance in 13 min. 32 1-5 sec. In connection with the last two

A Stop for Petrol at Partenkirchen.

Automobil Welt.

CONTINENTAL TOURING SNAPSHOTS.

events Herr Louis Peter, director of the tyre company which bears his name, presented a beautiful trophy, consisting of a handsome cup, to become the property of whoever holds it for two years in succession. The cup is an international one, and will be governed by conditions somewhat similar to those existing in the case of the Gordon Bennett Cup. Entries will be accepted only for large racing cars up to sixty horse power, and over a distance of ten miles. The first three in the last two races competed for the trophy, but the event proved an easy victory for Poëge, who won in 12 min. 51 sec., beating the second man by a lap and a half. The races were run off in the presence of fully 30,000 spectators, and in the evening a banquet was held.

MR. A. G. BERGMANN, who some time ago made an automobile trip from Paris across the whole of Europe and part of Russia, combining the same with shooting and fishing, is about to make a similar excursion from Paris, via Switzerland, Austria, South Russia, Caucasus, and on to Teheran, in Persia. This time, however, he would like to have a companion, who would share the expenses as well as the pleasures of the journey. Should any reader of the *Journal* think well of the project, I can put him in communication with Mr. Bergmann.

THE entries for the Deauville race meeting on the 10th inst. already include about thirty cars. Those in the racing section comprise two 70-h.p. Mors, a 60-h.p. Mercedes, a 60-h.p. Panhard and a Napier.

THE INSPECTION OF PETROL CARS.

NOWHERE is it more emphatically true that "an ounce of prevention is worth a pound of cure" than in the care of motor-cars. Frequent and conscientious inspection supplies the necessary "ounce of prevention," and is capable of minimizing, if not entirely precluding, the necessity of repairs upon the road. Repairs made in the stable are conducted under favourable conditions, with all the necessary tools at hand and free from the officious advice of the ever curious and embarrassing roadside committee. Repairs upon the road must be made under the most disadvantageous conditions, and the likelihood of their being required should be, as far as possible, forestalled.

If a motor-car be thoroughly and intelligently inspected before starting upon a run, its owner may go forth with the reasonable assurance that nothing untoward will take place, and may certainly have the satisfaction of knowing that whatever may happen upon the trip is not his fault, but due to some hidden weakness or defect in design for which he is not to

violent stresses caused by the surging of the liquid while traversing rough roads.

There are two portions of every automobile which deserve special care: the steering gear and the brakes. Upon them, more than on any other portions of the mechanism, depends the safety of the owner. All nuts upon any part of the steering gear should receive the most earnest scrutiny, to see that they are tight and that cotter pins or lock nuts are properly in place. When the steering wheel is in the straight ahead position the wheels should likewise be found to point directly forward—perfectly parallel one with the other. If any part of the gear be found bent, a close examination should be made. There should not be much lost motion between the movement of the steering handle and the wheels, as that shows that something is worn or loose, which will render the steering less positive than it should be. The steering gear throughout should be nearly free from spring or give when the handle is operated with the wheels at rest; on the other hand, it should work freely when the wheels are off the ground or the carriage is in motion, and this demands that all the joints be kept well lubricated.

A Steam Wagon built by the Yorkshire Patent Steam Wagon Co. for the Shell Transport and Trading Co., Ltd., London, to carry Petroleum. A description of the Yorkshire Co.'s vehicles was given in our issue of March 28th last.

blame. It may almost be said with truth that a well-designed motor-vehicle, of good workmanship and of the best material, will not give out on the road if it is given the benefit of a precautionary examination.

In the inspection of a motor-car the first consideration is to assure one's self that all working parts are free from dirt and dust from the road. A machine will not work well if it is dirty. Not only will it wear excessively in every moving part, but an accumulation of dirt from the road will sometimes destroy the free action of valve stems, throttle levers, and other parts of the vehicle which are returned to position by springs. All the working parts should be gone over with waste moistened with petrol, not only to remove the dirt, but to absorb the excess of oil upon exposed surfaces, the presence of which favours the collection of dirt from the dusty air. A glance should be given the petrol tank to see that it is well filled. The piping should be examined for leaks, and all unions, elbows and other connections tested to see that they are tight mechanically. A moment's attention is sufficient to assure one that the water tank is full and that it has developed no leaks in the soldering, due to the

The nuts which hold in place the various parts of the emergency brake and its operating mechanism should receive no less stringent examination. Oil should be carefully avoided upon leather band brakes, and an occasional application of "belt compound" to the band will keep it flexible and give it a grip, if it is well designed. One should see that the adjustments are such that the brake band comes fully into operation upon its drum before the operating mechanism—pedal or lever—reaches the limit of its motion, but the band should not drag unduly upon the drum when the brake is supposed to be off.

Chains should be carefully examined to see that they are not loose enough to make possible their breakage through climbing the teeth of the sprockets, and not tight enough to cause them to run stiffly. Chains should frequently share in the general cleaning operation, and it is well to see that the detachable link which fastens together the two ends of the chain is secure.

The adjustment of clutches requires to be looked after. One should not neglect to try the wrench upon all the nuts of the frame, and to see that cotter pins and lock nuts are doing their duty; or fail to see that all four wheels run freely when jacked

up off the floor, and have their bearings well lubricated. It is hardly necessary to remind one to inspect the tires, to make sure that they flatten but little under the weight of the car.

When the motor is reached in the process of inspection, turn it over by means of the crank and determine whether or not the compression is as high as it ought to be. If it is found that the engine passes the compression point too easily and that the charge escapes, one should look for leaks. Before going to extremes in the direction of taking the engine apart, it is well to start it and watch each of the possible leaky points while the engine is in operation. The leak may then often be located by the visible escape of gas during explosion. If a leak is found to have developed about the cylinder head, the cooling water will have to be drawn off, the cylinder head removed and a new piece of asbestos packing cut to fit, saturated with water or oil and put in place. Should the leak appear to be in or about either the exhaust or inlet valves, try tightening the bolts which hold the valve seating in place, see that the valve stems have not become bent through accident, and make sure that the springs which should hold the valves closed are in good working order. Perhaps new washers under the valve flanges will solve the problem, but if not, it is probable that the valve will have to be re-ground into its seat. If no leak is found at any of the points mentioned, and the compression still remains weak, it must be that the piston is not tight—a serious matter, which means that the engine must go to the repairers. Fortunately this should happen only after long use of the motor.

If oil cups are provided upon the engine they should be opened to see that they drip regularly and with proper frequency. If splash lubrication is the method employed, a sufficient amount of fresh oil should be supplied to the crank case and the drawing off plug screwed in firmly. In case the engine, while running, is unduly noisy, the "pounding" may be due to wear in the crank-shaft bearings or in the bearings of the connecting rod in the piston or upon the crank. If means are provided for so doing, this lost motion should be taken up by tightening the bearings as much as possible without causing the engine to turn stiffly. All the nuts upon the bolts which hold the engine to the car frame should be tried with a wrench to make sure that they are secure.

The transmission gears should be seen to be well covered with heavy oil or gear grease and to be in correct mesh. The gear shafts ought to fit well in their bearings, as any play there will cause the gears to "chatter" badly. If there is any means of adjusting these bearings, the lost motion may readily be taken up and the gears made to engage perfectly. There is a great deal of pressure on these gear shaft bearings, and they must be kept well lubricated. An automobile frequently inspected along the lines indicated may, remarks Mr. A. L. Clough in the "Horseless Age," be expected to give very little trouble while in use. "Everything tight and in correct adjustment" is the gist of motor-car inspection, and by following out this maxim one will be subscribing to the truth of the aphorism which someone has propounded, "The best way to deal with accidents in machinery is not to let them happen."

MR. E. KALKER, of Coventry, is specialising in insulating wire for motor-cars and motor-cycles.

THE members of the Southern Motor Club are arranging a garden party at the Glyn Arms Hotel, Ewell, for Saturday next, the 12th inst.

A LIST of the registered automobile owners in the State of Connecticut which has just been issued discloses the interesting fact that up to August 8th last 1,050 automobile licences had been granted.

THE Library of Congress at Washington, U.S.A., is provided with large electric motor delivery wagons, the property of the U.S. Government. Notwithstanding this fact, it has been decided that the vehicles must be registered and numbered, and their drivers provided with licences, as would be required if the vehicles were owned privately.

THE KING WATER-CIRCULATION INDICATOR.

A NEW device for indicating the circulation of cooling water on petrol motor-cars has been put on the market by Mr. A. W. King, of Maywood, Hackensack, New York, U.S.A. The apparatus, which is illustrated in section herewith, is intended to provide means to show whether the mechanism employed for causing the water to circulate is in perfect working order. The indicator also enables the driver to ascertain the relative state of purity of the water moving through it, a transparent tube being provided for this purpose. The device further serves to remove some of the impurities that may get into the water-circulating system. To this end the lower part of the indicator is provided with a pocket into which any impurities finding their way into the device will settle, and from which they can be drawn by means of a drain cock. The water moving through the indicator impinges against a vane revolving upon

two spindles. The vane is always in plain view, and its motion is proportional to the rate of flow of the water. Should the circulation for any reason cease, the vane will come to a standstill, giving a visual indication of the fact. The indicator can be placed on the dashboard either in a horizontal or vertical position, without altering its effectiveness. The metallic parts of the indicator are of non-corrosive material, and the transparent member is an annealed glass tube of suitable thickness.

Should it become necessary to replace the glass tube, this can be readily accomplished by unscrewing the plug in the upper part of the device. The apparatus is inserted in the circulating system by means of rubber hose connections or metallic piping. It is claimed to be immaterial into which opening of the indicator the fluid enters and through which it leaves. To make the revolving motion of the vane more discernible portions of the latter are tinted in strongly contrasting colours.

At the Southport meeting of the British Association next week the Road Traction Committee will present a report, while among the papers to be read are one by Prof. Hele-Shaw on "Clutches," one on "The Problem of Modern Street Traffic," by Lieut.-Col. Crompton, and one by Mr. T. Clarkson on "Steam Traffic on Common Roads."

THE staff of the Wolseley Tool and Motor Car Company held their annual outing on Saturday, the 29th ult., the destination being Holt Fleet, on the Severn. About 600 of the staff and workmen availed themselves of the invitation of the firm, and travelled by the Midland Railway to Worcester, and thence to their destination by steamer. A most enjoyable day was spent, the sports which had been arranged among the men contributing largely to the success of the outing.

MOTOR-CYCLING NEWS.

THE Hon. Leopold Canning, D.L., recently invited the Motor Cycle Union of Ireland to Garvagh, which was also made the terminating point of a reliability trial. For the first stage of the journey the contest was from Glengormley at 10 a.m., via Antrim,

M. Sigonnaud, who won the 5-mile Race at Canning Town on Saturday last. *(La Locomotion.)*

Randalstown, Toomebridge, Maghera, and Garvagh; and the return journey was via Kilrea, Portglenone, Randalstown, Antrim, to Glengormley—a course which embraces every variety of road, and is undoubtedly a most exhaustive test of the thorough reliability of the machines. The total distance is about 100 miles.

FULLY 5,000 persons attended at the Canning Town track on Saturday last to witness some interesting motor-cycle races. One of the events was a mile match between G. A. Barnes, M. Sigonnaud and Maurice Fournier. The latter won two of the three events—covering the mile in 1 min. 17 4-5 sec. Fournier repeated his victory over Barnes and Sigonnaud, who finished in the order named in a three miles "flying start" contest. In the third contest—a five miles race from a standing start—Fournier and Sigonnaud frequently changed positions, but in the end Sigonnaud beat Fournier for first place by twenty yards in 7 min. 10 1-5 sec. Barnes had tyre troubles, and eventually retired.

THE awards in connection with the reliability trials organised by the Auto-Cycle Club have now been made known. The trials, it will be remembered, consisted of a series of daily runs, starting from the Crystal Palace, to Canterbury, Worthing, Brighton, Eastbourne, Basingstoke, Folkestone, etc., for nine days, during which the competitors covered 1,036 miles. As the weather during the greater part of the time was of the worst possible description, it says much for the high point of efficiency to which motor-cycles have now attained that so many competitors were able to secure certificates, notwithstanding the severe tests to which the machines were subjected.

THE following are the awards:—

First Class Certificates.—2½-h.p. spring-frame Bat, 2-h.p. Bradbury, 3-h.p. Chase, 2½-h.p. Kerry, 2½-h.p. King, 2½-h.p. Ormonde, 2-h.p. Werner.
Second Class Certificates.—2½-h.p. Alldays and Onions, 3½-h.p. Booth, 2½-h.p. Bradbury, 2-h.p. F.N., 2½-h.p. Griffon, 2½-h.p. J.A.P., 2½-h.p. Lagonda, 2½-h.p. Matchless, 2-h.p. Peugeot, 3½-h.p. Phoenix tricycle, 2½-h.p. Robinson and Price, 2½-h.p. Werner.
Third Class Certificates.—2½-h.p. Ariel, 2½-h.p. Castell, 2½-h.p. Phoenix, 3-h.p. Rex.

Mr. A. van Hooydonk was awarded a silver medal for the best performance in the Private Owners' Class.

THE motor-cycle reliability trial of the Southampton Motor Club, originally fixed for the 24th ult., was, owing to the bad weather, postponed until the 27th ult. Out of thirteen entries eleven actually competed, and of these ten finished. M. H. J. Byrne, who rode a 2½-h.p. Excelsior, was declared the winner, thus carrying off the vase offered as a prize by Messrs. Humber, Ltd.

IN the evening the members and a few friends partook of supper together at Scullard's Hotel, Southampton. Captain T. H. Stringer presided. "Boiled lamp," and "carburettor sauce," "roast tank," and "stuffed sparking plugs" were amongst the delicacies provided. After the loyal toasts had been honoured, the chairman presented the silver vase to the winner, Mr. Byrne, on behalf of the Humber Company, and the health of "the winner" was afterwards enthusiastically drunk. Responding to the toast "Success to the Southampton Motor Club," Mr. F. B. Wride said the gathering that day should prove a considerable factor in increasing the popularity of the club. As far as they were concerned, he believed the members would do all they could to see that the regulations of the Motor-Car Bill were kept.

THE third of the series of 200 mile trials for the S. F. Edge trophy was held by the Motor Cycling Club on Saturday last. The route was the same as followed on the previous tests, viz.: 1st stage, Hatfield to Stony Stratford, back to Hitchin, and thence to Hatfield; 2nd stage, Hatfield to beyond Berkhamstead and back; and third stage, Hatfield to Hertford, Royston, Buntingford and back to Hatfield. There were thirteen starters, of whom Crundall on a 2½-h.p. Humber, and Milligan on a 2½-h.p. Bradbury made non-stop runs. Moore (2½-h.p. Booth), Cox (2½-h.p. Ormonde), and Brown (Minerva) also went the full course.

Mr. J. H. Leonard, the holder of the "Motor-Car Journal" Challenge Cup.

THE Motor Cycling Club is holding a one hundred miles non-stop "passenger contest," and a fifty miles non-stop single motor bicycle competition on Saturday, the 12th inst. Riders who intend competing in this event should communicate with the hon. sec., Mr. G. E. Roberts, 17, Fieldhouse Road, Hyde Farm, Balham, S.W. To-day (Saturday) there will be a run to Chertsey.

THE Austrian military authorities have made arrangements to give a special course of training to motor-cyclists. Several officers and non-com. officers have been sent to factories to acquire technical knowledge of the construction and repair of motor-cycles and a large number of soldiers will be trained by these in handling and repairing machines.

HERE AND THERE.

INCREASING attention is being devoted to the question of utilising motor tractors in connection with agricultural work. At home, we have the "Ivel" agricultural motor, while in

A SYNDICATE is being formed in Dublin to run a service of motor-vehicles.

At Hastings there will shortly be six routes worked by motor-omnibuses.

THE Prime Minister has given £100 to a fund now being raised to meet the expenses of a committee to be formed to investigate the dust nuisance.

To meet the convenience of the trade, the Sirdar Rubber Company, Limited, have arranged to supply rims, rolled to their special section, at a price which does not include the royalty for the use of the patent. The rims so supplied can only be used or re-rubbered with rubber tyres supplied by the Sirdar Company, the royalty charged for the use of the patent being included in the price of the rubber—an arrangement which enables motor-car makers to build their wheels and pay no royalty until the cars have to be delivered.

A NEW fuel for petrol cars is being introduced by the British Refined Motor Spirit Co., of Bristol, they having put down plant for the rectification of a compound spirit, for which they claim remarkable results in the way of mileage per gallon.

MR. W. KINGDON, of Bideford, suggests that the London and South-Western Railway Co. should connect their terminus at Torrington with Okehampton by means of a motor-car service, thus saving some 40 to 50 miles in distance between the two places named.

Germany one or two machines somewhat on the lines of the latter have recently made their appearance. This week we are able to reproduce two photos sent us by Messrs. Alf. Dougill and Company, Limited, of Leeds, showing how the Maurer friction-driven lorries can be utilised to drive agricultural machinery. The 9-h.p. lorry illustrated is adapted to carry a load of 30 cwt.; by fitting a wood pulley on the end of the countershaft it is converted into a portable engine, driving a chaff cutter and threshing machine.

MESSRS. G. GREEN AND CO. have a well-equipped workshop at Reginald Road, Bexhill-on-Sea, where motor-car repairs of all kinds can be undertaken.

MESSRS. JOSEPH LUCAS, LIMITED, of Birmingham, are issuing a small pocket case of court plaster which they will send to any reader on receipt of a penny stamp.

MR. THEO. MASUI, the agent for Germain cars, has taken up the sole agency for a new leather tyre cover, with patent non-slipping tread attached, known as the Hutchinson-Samson.

THE Queen of Spain, who is at present in Paris, has been making a number of tours in the neighbourhood of the French capital in a Panhard landaulet.

M. A. S. Matier, of Lorne, Craigavad, Co. Down, who was motoring in England, has died suddenly at the Midland Hotel, Birmingham, from heart failure.

A Maurer Petrol Lorry Driving a Chaff-Cutter.

A Maurer Petrol Lorry Driving a Threshing Machine.

THE new Merryweather motor steam fire engine ordered by the borough of Brighton left London on Saturday last, and made a successful trip from Greenwich to the Brighton fire station. The new machine delivers 400 gallons per minute, and can travel, fully loaded, at any speed up to thirty miles an hour.

THE Toronto Automobile had a very successful run early last month.

MOTOR-CAR speed trials will be held at Southport on October 2nd.

THE Prince of Oldenburg has recently acquired a "Sage" 20-h.p. petrol car.

THE Sheffield Automobile Club will hold a run to-day (Saturday) to Buxton.

TO-DAY (Saturday) the Wolverhampton and District Automobile Club will hold a run to Shrewsbury.

THE business of Messrs. H. W. Van Raden and Company has been converted into a limited liability company with a capital of £10,000.

THE cabmen in Sydney are encountering opposition from motor-cars which are being used by the doctors of Sydney, who hire them, these motor-cars running in competition with ordinary licensed cabs.

A NEW model of the White steam car, specially designed for long distance touring, has recently been introduced. It is capable of running a distance of no less than about 250 miles on one filling of the tanks. This result has been secured, not

A White Steam Car ascending Scott Street, Glasgow—A Grade of One in Four.

only by the employment of larger fuel water tanks, but by increasing the efficiency throughout. One of these new cars is entered for the forthcoming reliability trials.

MR. J. W. SIMPSON has opened a garage in Broad Street, Margate, a fact of interest in view of the forthcoming reliability trials of the A.C.G.B.I.

THE R.L. Motor Engineering Company, Limited, has been registered with a capital of £1,000 to acquire the business of the Manor Park Engineering Company.

THE Forman Motor Co., Limited, Coventry, have just issued a new illustrated catalogue of their petrol motors, which are made in sizes ranging from 2½ h.p. up to 20-h.p.

MR. THOMAS BOOTH, whose depot at Frodsham is on the main road from Chester to Warrington, is now keeping a stock of petroleum spirit.

THE Motor Manufacturing Company, Limited, have issued a useful sheet of instructions for users of 10 and 20-h.p. M.M.C. cars with regard to the driving and lubrication of these vehicles.

AN autobiographical meeting is being arranged for by the Automobile Club of Toledo, U.S.A. Each member will be expected to submit a paper giving the name of his car, its cost, length of time in service, cost of running, cost of repairs, and any other information that might be of interest.

THOSE who are putting off the day of entering the ranks of motorists until the time motor-cars can be purchased at almost the price of a high-grade bicycle would do well to ponder over the two illustrations reproduced herewith from a French contemporary. They show the various parts, with the exception of the road wheels and tyres, which go to make up the chassis

of a 6½-h.p. voiturette. When it is remembered that practically each and every part shown consists of several pieces, that have to go through many operations and many hands ere being ready for the assembler, the wonder is rather that cars should be available at such relatively low prices than that they are likely to undergo considerable reduction in the near future.

THE electrical charabancs illustrated in our last issue is built by the Vehicle Equipment Company, of Brooklyn, N.Y., for whom the Anglo-American Motor-Car Company, Limited, are agents in this country.

MESSRS. CARLESS, CAPEL, AND LEONARD have appointed Messrs. W. A. Mathew and Co., of High Street, Beckenham, their agents during the Reliability Trials. They have made arrangements with the Crystal Palace Company, enabling them to deliver petrol, at their garage, to cars running in the trials, between the hours of 6 and 10 a.m.

ON Friday last week Messrs. R. Reynold Jackson and Co. subjected one of their 8-h.p. "Jackson Tourists" to the ascent of Netherhall Gardens, N.W., one of the steepest hills in the London district. On the first attempt the climb was successfully

Some of the many parts of a Motor-Car (see above).

made with two persons; on the second attempt three passengers were taken; another with four; and finally the car mounted the hill with six persons up, the total weight being 56 stones. In view of the fact that no special preparation was made for the test, the performance of this little 8-h.p. car is undoubtedly a good one.

SOME USEFUL NOTES.

RUSTY and bent rims may be the cause of cut edges in pneumatic tyres. To prevent the rims from rusting, the tyres and especially the rims should be cleaned from sand and water after every run. Great care should be taken, in washing the wheels, to have the tyres fully inflated and the valve and thumb nuts properly tightened, so as to prevent water from getting into the edges, or through the stud-holes into the interior of the rim. If, nevertheless, water has found its way into the rim, detach the tyre at once, and carefully dry it. A good way is to paint the inside of the rim with some oil paint, so as to prevent it from rusting. A rusty rim is, states the Continental Tyre Company, greatly responsible for the rotting of the canvas, which is the cause of cutting the edges. The latter is also caused by dented rims. These dents are easily caused by violently knocking against the curb stone, driving with tyres deflated or down on the rims. For this reason alone it is advisable to detach the tyres now and then and to examine the rims, so as to remove by hammering any dents that may be there.

WHAT appears to be a useful form of oil can has lately been put on the market by Mr. Frank F. Weston, of 83, Chambers Street, New York. It consists of an oil reservoir, an oil pump, a spout and a tap. The capacity of the can is one quart; after filling it the cap is replaced and the pump worked a few strokes. To

lubricate any part of the motor or vehicle, the tap is opened, allowing the oil to escape, owing to the air pressure, in a continuous stream, the velocity of which can be regulated by the tap. The spout has a tube fitted to it which extends almost to the bottom of the reservoir, so that practically all the oil in the can may be forced therefrom.

BRAKES should not be applied suddenly, but gradually. By doing so, you not only save the tyres, but also avoid accidents, as the sudden application of the brake may cause the car to skid.

Go over the car carefully before your initial "spin." The manufacturer may have been most careful in every particular; nevertheless a lubricator may have been left unfilled; a nut perhaps was not tightened properly; the brakes may not have been set just right. Go over every nut and bolt and prove to your own satisfaction that everything is as it should be. Vibration will often loosen the tightest nut, so it is customary to hold them from falling off by means of cotter pins or otherwise. This is a wise precaution and should be insisted upon. The steering mechanism and brakes should receive very particular attention. Be sure that there is no lost motion or loose nuts in any part of the steering gear, and that the brakes may be easily and firmly applied on pressing down the foot lever. The means of adjusting the brake bands should be observed, as occasionally they will require adjusting. The hub caps should be removed to ascertain if the axle end nuts and lock nuts are properly tightened.

THE RELIABILITY TRIALS.

THE following is a complete list of entries for the Reliability Trials of the A.C.G.B.I., which commence on the 18th inst.

CLASS A1.

Tandems, Quadricycles, and similar two-seated vehicles, over 170 lb weight, and at a selling price of £160 or less.

Official No.	General description.	Diameter of cylinders.	Length of stroke.	Brake h.p.	Weight unladen. Cwt.
1	Century Tandem ..	88 mm.	110 mm.	6½	5
2	6-h.p. Eagle Tandem ..	90 mm.	110 mm.	6	6½
3	3½-h.p. Rex Tricar ..	3½ in.	3½ in.	3½	320 lb.

CLASS A.

Vehicles declared at a Selling Price of £200 or less.

4	Baby Peugeot ..	94 mm.	100 mm.	5	7
5	6-h.p. Regal ..	100 mm.	110 mm.	6	8
6	6-h.p. Siddeley ..	4½ in.	5 in.	6	8
7	6½-h.p. Century, two-seater ..	88 mm.	110 mm.	6½	9
8	7-h.p. Vesta ..	100 mm.	120 mm.	7	800 lb.
9	6½-h.p. Vulcan ..	4 in.	4 in.	6½	10
10	6-h.p. Wolseley light car ..	4½ in.	5 in.	6	9
11	Stanley Steam Car ..	2½ in.	3½ in.	5½	9
12	5-h.p. Coventry Humberette ..	3½ in.	3½ in.	5	5½
13	5-h.p. Beeston Humberette ..	3½ in.	3½ in.	5	5½
14	6½-h.p. Cadillac ..	5 in.	5 in.	6½	1,250 lb.
15	Pony Richard ..	90 mm.	100 mm.	5½	—
16	6-h.p. Relyante ..	90 mm.	110 mm.	6	8½
17	5-h.p. Oldsmobile ..	4½ in.	8 in.	5	7
18	6½-h.p. Clyde ..	90 mm.	110 mm.	6½	7½
19	6-h.p. Elswick ..	100 mm.	110 mm.	6	8
20	6-h.p. De Dion Bouton ..	90 mm.	110 mm.	6	8
21	5-h.p. Oldsmobile ..	4½ in.	6 in.	5	7
22	7-h.p. Cottareau ..	105 mm.	115 mm.	7	9
23	8-h.p. Achilles ..	100 mm.	110 mm.	8	11

CLASS B.

Cars declared at a Selling Price of more than £200, and not more than £300.

24	6-h.p. Swift ..	90 mm.	110 mm.	6	10
25	8 to 10-h.p. Regal ..	100 mm.	110 mm.	8 to 10	15
26	7-h.p. Coronet ..	95 mm.	110 mm.	7	9.5
27	10-h.p. Century ..	88 mm.	110 mm.	10	15
28	9-h.p. Beaufort Tonneau ..	110 mm.	120 mm.	9	13
29	9-h.p. Argyll ..	100 mm.	120 mm.	8	12
30	10-h.p. Pick Tonneau ..	4½ in.	4½ in.	10	19
31	10-h.p. Pick Voiturette, with dickey seat ..	4½ in.	4½ in.	10	17
32	9-h.p. Mathieu ..	110 mm.	130 mm.	9	13
33	9-h.p. Renault ..	100 mm.	120 mm.	9	13½
34	10-h.p. Georges Richard ..	100 mm.	100 mm.	10	11½
35	9-h.p. Eagle ..	85 mm.	110 mm.	9	19
36	10-h.p. Rex ..	4½ in.	4½ in.	10	15
37	4-h.p. two-seated Roots Car ..	4½ in.	5 in.	4	7
38	9-h.p. Mohawk Manon ..	100 mm.	120 mm.	9	12
39	8-h.p. M.M.C. ..	100 mm.	130 mm.	8	10
40	9-h.p. Darracq

CLASS C.

Cars declared at a Selling Price of more than £300, and not more than £400.

41	10-h.p. Gladiator ..	105 mm.	130 mm.	10	14½
42	12-h.p. Albion ..	4½ in.	5 in.	12	21
43	10-h.p. Hallamshire ..	105 mm.	120 mm.	10	15½
44	8-h.p. Standard ..	5 in.	3 in.	8	12
45	12-h.p. Arrol-Johnston Dogcart ..	4½ in.	6 in.	12	25
46	7-h.p. Star ..	4 in.	5 in.	7	14½
47	9-h.p. James and Browne ..	4 in.	6 in.	9	17
48	10-h.p. Argyll ..	88 mm.	120 mm.	10	13
49	14-h.p. Argyll ..	90 mm.	120 mm.	14	14½
50	10-h.p. Simms Welbeck ..	95 mm.	110 mm.	10	10
51	12-h.p. Wolseley ..	4½ in.	5 in.	12	19
52	10-h.p. Wolseley ..	4½ in.	5 in.	10	19
53	12-h.p. Century ..	105 mm.	130 mm.	12	17
54	12-h.p. Krupkar ..	115 mm.	120 mm.	12	15
55	9-h.p. Humber ..	3½ in.	4½ in.	9	14
56	10-h.p. Horbick ..	105 mm.	114 mm.	10	17½
57	12-h.p. Georges Richard ..	104 mm.	100 mm.	12	13½
58	12-14-h.p. Relyante ..	100 mm.	140 mm.	12 to 14	15½
59	13-h.p. Rex ..	4½ in.	4½ in.	13	16½
60	10-h.p. Dechamps ..	100 mm.	140 mm.	10	16½
61	10-h.p. Ryknield ..	3½ in.	4½ in.	9	14
62	7½-h.p. Wolseley ..	4 in.	4 in.	7½	15
63	10-h.p. Spyker ..	100 mm.	120 mm.	10	13
64	12-h.p. Darracq

CLASS D.

Cars declared at a Selling Price of more than £400, and not more than £550.

Official No.	General description.	Diameter of cylinders.	Length of stroke.	Brake h.p.	Weight unladen Cwt.
65	12-h.p. Sunbeam ..	80 mm.	120 mm.	12	15-16
66	12-h.p. Gladiator ..	88 mm.	110 mm.	12	15½
67	12-h.p. Ariel ..	3½ in.	3½ in.	16	17
68	14-h.p. Brooke ..	3½ in.	4½ in.	14½	18½
69	16-h.p. Okodyne* ..	3½ in.	4½ in.	9	21
70	10-h.p. Thornycroft ..	4 in.	4½ in.	10	15½
71	10-h.p. Peugeot ..	105 mm.	105 mm.	10	—
72	20-h.p. Hallamshire ..	105 mm.	120 mm.	20	19
73	Cremorne Car* ..	3½ in.	4 in.	12	25
74	12-h.p. Arrol-Johnston 6-seater ..	4½ in.	6 in.	12	27
75	8-10-h.p. Elswick ..	110 mm.	130 mm.	8 to 10	15
76	16-h.p. Century ..	88 mm.	110 mm.	16	19
77	10-h.p. Star ..	3½ in.	4½ in.	10	17
78	14-h.p. Beaufort Tonneau ..	115 mm.	130 mm.	14	16
79	16-h.p. Argyll ..	88 mm.	110 mm.	16	16
80	15-h.p. Belsize ..	4 in.	5 in.	15	17½
81	12-h.p. Belgica ..	120 mm.	140 mm.	15	17
82	14-h.p. Brooke ..	3½ in.	4½ in.	14	19
83	10-h.p. Relyante Steamer* ..	2½ in.	3 in.	10	18
84	10-h.p. White Car* ..	3 in. h.p.	3½ in.	10	16
85	12-14-h.p. Dennis ..	105 mm.	130 mm.	12 to 14	15
86	12-h.p. Clement ..	75 mm.	120 mm.	12	14½
87	10-h.p. Lanchester ..	5½ in.	5 11-16 in.	10	19½
88	12-h.p. Sunbeam ..	80 mm.	120 mm.	10 to 12	16
89	12-h.p. Brush ..	85 mm.	118 mm.	12	18
90	16-h.p. Maxim ..	110 mm.	120 mm.	16	—
91	12-h.p. De Dion Bouton ..	100 mm.	110 mm.	12	14
92	12-h.p. New Orleans ..	95 mm.	110 mm.	12	17
93	10-h.p. Renault ..	100 mm.	110 mm.	10	13

CLASS E.

Cars declared at a Selling Price of more than £550, and not more than £700.

94	20-h.p. Thornycroft ..	4 in.	4½ in.	20	17
95	12-h.p. Chelmsford* ..	4 in.	4 in.	12	28
96	15-h.p. Germain ..	95 mm.	130 mm.	15	18
97	15-h.p. New Orleans ..	100 mm.	110 mm.	15	19
98	16 to 20-h.p. Elswick ..	110 mm.	130 mm.	16 to 20	17
99	15-h.p. Star ..	4 in.	4½ in.	15	18
100	18-h.p. James & Browne ..	4 in.	6 in.	18	18½
101	20-h.p. Simms Welbeck ..	95 mm.	110 mm.	20	12½
102	24-h.p. Wolseley ..	4½ in.	5 in.	24	23
103	12-h.p. Gobron-Brillié ..	90 mm.	110 mm.	12	18
104	20-h.p. Winton ..	5½ in.	6 in.	20	23½
105	10-h.p. Gardner-Serpollet* ..	75 mm.	72 mm.	10	20
106	24-h.p. Georges-Richard ..	104 mm.	100 mm.	24	16½
107	20-h.p. Velox ..	105 mm.	110 mm.	20	19
108	16-20-h.p. Dennis ..	88 mm.	110 mm.	16 to 20	18
109	16-h.p. Lanchester "Single Tonneau" ..	5½ in.	5½ in.	16	20
110	12-h.p. Chelmsford* ..	4 in.	4 in.	12	28
111	20-h.p. Spyker ..	100 mm.	120 mm.	20	19½
112	15-h.p. Pipe ..	100 mm.	135 mm.	15	20
113	14-h.p. Renault ..	85 mm.	105 mm.	14	15
114	14-h.p. Martini ..	100 mm.	130 mm.	14	16½
115	25-h.p. Cassell ..	100 mm.	120 mm.	25	14
116	10-h.p. White* ..	3 in. & 5 in.	3½ in.	10	16
117	12-h.p. Humber ..	3½ in.	4½ in.	12	19
118	24-h.p. Darracq ..	—	—	—	—

CLASS F.

Cars declared at a Selling Price of more than £700, and not more than £900.

119	12-h.p. Peugeot ..	85 mm.	90 mm.	12	17
120	20-h.p. Germain ..	105 mm.	140 mm.	20	19
121	20-h.p. Beaufort Tonneau ..	95 mm.	110 mm.	20	21
122	20-h.p. Humber ..	4½ in.	5½ in.	20	21
123	12-h.p. Wilson and Pilcher ..	3½ in.	3½ in.	12	19½
124	15-h.p. Daimler ..	95 mm.	130 mm.	18	20
125	25-h.p. Maudslayi ..	5 in.	5 in.	25	23
126	16-h.p. De Dietrich ..	104 mm.	120 mm.	16	18½
127	15-h.p. C.G.V. ..	90 mm.	130 mm.	15	19
128	18-h.p. Chenard and Walcker ..	100 mm.	130 mm.	18	20
129	15-h.p. Pipe, with magneto clutch ..	100 mm.	135 mm.	15	20
130	16-h.p. Rochet-Schneider ..	100 mm.	150 mm.	16	20

* Only supplied with car.

THE Mohawk Motor and Cycle Co., Ltd., of Chalk Farm Road, N.W., have turned their ground floor into a motor garage, with inspection pits and ample floor space for storing cars. A large stock of petrol and spare parts is kept, while facilities are at hand for recharging accumulators and the carrying out of repairs of every description.

MESSRS. DRAKE AND GORHAM, LIMITED, have sent us a pamphlet describing the Holden magnetic clutch. This is of very simple construction, consisting of a thick disc of wrought-iron keyed on the main shaft, and having a magnetising coil wound in a groove on its face; an iron plate is fixed to the pulley to be driven, and between the polar faces a thin steel disc is placed to prevent their adhesion due to residual magnetism.

CORRESPONDENCE.

THE MOTOR-CAR ACT.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having just returned from France after a fortnight's stay, visiting some of the finest motor-car works there, including those of Clement, Peugeot, Darracq, etc., and being particularly observant the whole of the time in the movements of automobiles, horses, and constables in connection with the former, I can quite bear out what Mr. Sturmev stated in his excellent letter to Mr. Long, that on the Continent, in the open country, notwithstanding the speed limit, nothing seems to be said, whatever the speed, unless, of course, the traffic is such as to be dangerous. In this country, on the other hand, we have been carefully watched on the most favourable and safest roads, where a speed of twenty-five miles an hour would inconvenience nobody. Still, if the unfortunate motorist is said to have exceeded his twelve miles an hour, he has been subjected to unreasonableness and gross injustice, which is monstrous, thus checking an industry in this country, the magnitude of whose possibilities no one can calculate.

Fully nine-tenths of the danger of fast motoring is done away with through the horses being trained to all the requirements of all conditions of the road. During the whole of my movements, not in one single instance did I see a horse make the smallest possible ado even when motors were most numerous, proving that the cause of most of the trouble in this country is through horses that ought never to be allowed on the public highway. In my opinion, with reason and justice, the Motor-Car Act, with fair treatment by the Local Government Board, will not impede the industry. If, however, on the contrary, we suffer from incorrect statements and biased conclusions, we shall at once starve as regards engineering possibilities.—Yours faithfully,

A. E. JOHNSON.

received our note and invoice in an envelope marked "O.H.M.S. address not known."—Yours truly,

WEBSTER AND Co.

AN "ACT" OF DISCOURAGEMENT.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Before advocating the "teaching of everyone in a position of influence that the safety and absolute control associated with the modern motor-car is undoubted," as you do in concluding your article on this subject in your current issue, it will be absolutely necessary to satisfy such that what you claim is a reality, because they are perfectly aware that, on the contrary, it is not so, which is proved by the frequent fatal accidents which occur almost every day through their not being under proper control, on account of defective brakes and tyres, and not being provided with safety appliances.

In these circumstances, it is not surprising that the Act just passed is "An Act of Discouragement," or, as described by your contemporary, "The Automobile Club Journal," "Killing an Industry," but which, under existing conditions, would have been more appropriate as "Killing : Industry."

Perfect and reliable brakes and safety guards are, as you are aware, provided on tram cars, and they only run at a speed of from five to ten miles an hour, whereas motor-cars often exceed that several times; therefore, would it not be more advisable, in the interests of motorists and the motor industry, to teach your readers to change this opinion, by providing such appliances, and thus rendering such occurrences, which are now so frequent, and rapidly increasing with the number of cars, less frequent, if not entirely conspicuous by their absence, instead of being almost inseparable, as one can scarcely see a paper nowadays without reading of one or more, the results of which are often appalling.—Yours truly,

HUMANE MOTORIST.

The Meet of the Kent Automobile Club at Shipbourne.

TRAPPED BY TELEGRAM.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Last Friday, driving through Dorchester, two policemen stopped my car and wanted to know if I had come from Bridport, as they had orders by telegram to stop a large red car, and as mine is a small green voiturette, I cannot regard this as otherwise than unnecessary persecution by some addle-pated country officials who must be colour blind. This took place in the centre of the town and in pouring rain, the usual crowd collecting and my engine stopped, of course. Cannot every motorist carry a little confetti and sprinkle it near traps.—Yours truly,

A LOCAL MOTORIST.

GRATITUDE ?

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—On Saturday, August 15th, we received a message urging us to send out immediately to a breakdown eight miles distant from our place at St. Albans. Although it was raining in torrents at the time our Mr. F. Webster hastened out to their assistance, and found two men in charge of a 9-h.p. car almost exhausted trying to get it going. Examination found various repairs necessary, which took 4½ hours. The car was put in order and proceeded to St. Albans on the way to Coventry. After filling with oil and ordering a few spare parts, the men asked for the account to be sent in to the owner, a gentleman at Shepherd's Bush, pretending they had only sufficient money to take them on to Coventry. Of course they were questioned, but they gave such satisfactory answers that the account was booked to the address given and sent in the same evening, but two days afterwards we

At the moment of going to press we have received a long and interesting reply from Mr. Norman Macdonald to Mr. Staplee Firth's letter in last week's issue, which we shall print next week.—Ed. M.-C. J.

MOTOR-CYCLE RECORDS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am surprised to note that the Bat Motor Manufacturing Company, Limited, state that T. Tessier beat world's records for 1, 2, 3 and 4 miles at the Canning Town track on August 3rd last, riding a 2½-h.p. Bat motor. I had the pleasure of witnessing Mr. Tessier's remarkable performance in company with M. Soncin, who manufactured the identical motor used, and the nominal horse-power of the engine, which is now known as the "Automotor" (bore 87 mm., stroke 108 mm.), is 4½-h.p. but it develops nearly 6-h.p.—Yours truly,

P. G. ASTON.

CLUB NEWS.

KENT.

ON Wednesday, the 26th ult., the members of the Kent Automobile Club were hospitably entertained to tea by the Rev. and Mrs. Cotton, at the Grange, Shipbourne. A most enjoyable afternoon was spent in the beautiful grounds of the host. Before leaving, the photograph of the members present and their cars, reproduced herewith, was taken.

The club had a very enjoyable afternoon on Saturday last, when a hill-climbing contest was participated in on Wrotham Hill. Some very

fine cars turned up, but particulars of the times, etc., will not be published until after the committee meeting.

MIDLAND.

—ON the invitation of Mr. and Mrs. A. L. Chance, a club run is being held to-day (Saturday) to Great Alne Hall, Alcester.

Where no alleged speed is given it is understood to be above the legal limit.

FINES amounting to £51, exclusive of costs, have been inflicted on motorists at Arundel in one day.

DURING the past fortnight fines amounting to £100 have been imposed on motorists in the county of Huntingdon, who have exceeded the legal limit of speed. Twenty other summonses are returnable for next week for alleged offences on the Great North road in the northern part of the county. In no instance, however, have the police taken action unless the pace was found to exceed twenty miles an hour, although fourteen miles is the limit stated in the county council bye-laws.

AMONG the batch of motor cases heard at Shoreham recently was that of John Bruton, who answered to an accusation of covering a quarter of a mile along the upper road at Southwick at thirty miles an hour. Defendant said he could not dispute the constable's word, but he did not believe he was travelling at the rate named, or anywhere near it. He had a brass plate on his car, so that there was no difficulty as to identification. That plea, however, did not mitigate the amount of the penalty, for he was fined £5 and 7s. costs.

HENRY R. FARQUHARSON, of Blandford, was summoned at Gillingham for driving a motor-car to the common danger at Gillingham on July 8th. Mr. Staplee Firth appeared to defend, and pleaded not guilty. The evidence of Sergeant Butson and P.C. Bishop was to the effect that defendant was driving a car, in their opinion, at over thirty

miles an hour. Sidney Hayter and Edwin Francis also gave evidence; that of Hayter differing materially from that of the police, except as to speed, while Francis could only state his opinion as to the rate the car was travelling at some distance beyond the spot spoken to by the other witnesses. Mr. Firth contended the evidence of Francis was irrelevant. Defendant went into the witness box and stated he was not travelling at more than nine to twelve miles an hour, and that he saw no children in danger of being run over. This evidence was corroborated by defendant's cousin, Mr. J. J. E. Farquharson, who was in the car with him. The magistrates retired, and on returning into court the chairman said the majority of the Bench had decided to dismiss the case. Each party would have to pay their own costs.

AT Retford County Police Court, on Saturday, Charles Sieveret, motor-driver, in the employ of Mr. Hall Watt, Bishop Burton, Beverley, was summoned for driving a motor-car at a greater speed than twelve miles an hour, at Torworth, on July 18th. P.C. Evans, of the Doncaster Borough Police, in response to a telegram from the police at Torworth, stopped the car, which was just approaching, at Doncaster. A fine of £10 and costs was imposed.

POLICE TRAPS.

ONE of the most dangerous police traps on the Brighton road is that between Purley and Horley.

OUTSIDE Warwick are three or four traps of a quarter of a mile in length.

ALLEGED REFUSAL TO STOP.

MR. L. GOLTWALTZ, auctioneer, Cardiff, was charged at Abergavenny, by Mr. Victor Bosanquet, chief-constable of Monmouthshire, with aiding and abetting the driver of his motor-car in driving at an excessive speed, refusing to stop when signalled, and giving a false name and address. Mr. Bosanquet said that on the 7th ult. he was driving a horse that had only recently been put in harness; it was attached to a brake. When about two miles out from Abergavenny, on the Monmouth road, he heard a motor-car approaching from behind, and held up his hand, his horse being restive. The car passed at something like thirty miles an hour. A few minutes later he found the car stopped by the roadside, and demanded the name and address of the driver, who told him "Thomas Johnson, Primrose Terrace, Shrewsbury." He also said he was the owner of the car. Subsequent inquiries proved this to be wrong. Witness called on defendant for the name and address of his driver, which he declined to give. After hearing the defendant's evidence the Bench accepted the statement of three other witnesses that no hand was seen by them signalling them to stop, but convicted on the other two charges, and fined defendant £5.

LICENSESES.

THE Inland Revenue authorities at Portsmouth prosecuted Edward Harding, cycle dealer, of Landport, for having kept a carriage without a license. The defendant was discovered driving a motor-bicycle with a trailer attached, in which his wife was seated. Two separate licenses were required—one for the motor and the other for the trailer.—A fine of £1 8s. was inflicted.

NO STAIN ON CHARACTER.

A SINGULAR prosecution took place at the Congleton Town Hall at the instance of the Chief-Constable of Congleton, Charles S. Hudson and John Nield, both of Stockport, being summoned for failing to pull up a motor tri-car in response to a signal from a person in charge of a restive horse. It was stated for the prosecution that on July 23 a man named John Broadhurst was in charge of a horse and cart in Congleton, when the defendants approached in a motor tri-car. Broadhurst, it was stated, put up his hand for them to stop, as the horse was becoming restive, but they failed to do so. The defendants were travelling at a reasonable speed. For the defence it was denied that Broadhurst put up his hand and both defendants went into the box, and stated that they had received no warning to stop. The police who had taken up the prosecution saw nothing whatever of the occurrence. The magistrate dismissed the case against Hudson, it being proved that he was not the driver. Nield was fined 5s. and costs, the chairman adding "There will be no stain on your character."

CLAIM FOR DAMAGES.

THE hearing of the action brought by Mrs. Elizabeth Greaves against Mr. Thomas Whitaker, of Newlay, to recover £500 damages for injuries sustained by the alleged negligence of the defendant in driving a motor-car, has been concluded. The accident out of which the action arose happened on December 27th last, while the plaintiff was crossing the Kirkstall Road, near the Cardigan Arms, Leeds, when the defendant drove his motor-car against her. In consequence of the shock she sustained serious injuries. Her skull was fractured, many of her teeth were knocked out, her sight and hearing had been impaired, she suffered from palsy of one side of the face, and had, since the accident, suffered from dizziness and indigestion. The jury, after half an hour's absence, returned a verdict for the plaintiff, assessing the damages at £125. His Lordship gave judgment accordingly.

THE Motor-Car Journal.

VOL. V.]

LONDON, SATURDAY, SEPTEMBER 12, 1903.

[No. 235.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

ON October 2nd and 3rd some important speed trials will take place at Southport, which now boasts an Automobile Club of its own, of which Mr. Marshall Hall, K.C., M.P., has just become the vice-president, and the secretary, Mr. F. Hugh, is proving an energetic officer. The trials have been organised by a local committee in conjunction with the Liverpool Self-Propelled Traffic Association, and the Mayor of Southport, Mr. T. Scarisbrick, and Mr. Leonard Williamson, the nephew of Lord Ashton, are taking great interest in the events, which will include motor-cycle races over a course of seven furlongs. In the tourists' car section there will be eight events over a kilometre course. The Lancashire clubs handicap will be another interesting item in the programme, and the racing car section should also be productive of exciting contests. Entries must be received at the A.C.G.B.I., 119, Piccadilly, W., before noon on the 25th inst., and, although an exception may be made in the case of foreign entries, no notice will be taken of applications from English competitors after that date.

"Blundering Legislation."

In a thoughtful article in the current number of the "Fortnightly Review" Mr. J. A. Spender discusses the question of Free Trade, and comes to the conclusion that "no commercial policy whatever could save us from the consequences, if the inheritors of wealth lost the strenuousness which had made wealth, or if, trusting to the old ways, we despised the weapons of precision and the scientific armaments which are as necessary in modern commerce as in modern warfare. Our industrial methods have indeed in recent years been somewhat analogous to our military methods. We mismanage the beginning, and are slow at the uptake of a new discovery, putting obstacles in our own path by blundering legislation; as in the case of the electrical industry, or more recently of the motor-car industry." Mr. Spender's conclusions with regard to the automobile show that he has followed the progress of the industry, and has recognised how the hampering conditions of modern legislation have prevented its early development to great things.

After the Race.

ECHOES of the great motor-car race in Ireland continue to reach us from the other side of the Irish Sea. Last week a woman was fined half-a-crown and costs at the Castledermot Petty Sessions for allowing her five head of cattle to wander on the public road near Castledermot two days before the event on July 2nd. Several people were also summoned for allowing their donkeys to wander at Abbeylands two days previous to the motor race. The usual nominal fines were imposed. Another example of the leisurely methods prevailing in Ireland is seen in a court of inquiry held at the police barracks, Naas, a few days ago, for the purpose of investigating a charge against Constables Godfrey and Fay, of the reserve force at the

depot, of having left their lodge at Ballyshannon after ten o'clock on the night of the 1st July. The accused, with other members of the Constabulary, were stationed at Ballyshannon for duty in keeping the course for the Motor-Car Race on 2nd July. After some contradictory evidence, it was announced that the result of the inquiry would be made known in about a week—two months after the event.

A Harmless Motorist Pulled up.

DURING the discussion on the Motor-Car Act, it was suggested that until a member of Parliament had been killed by a motor-car the House could hardly be expected to recognise the importance of the subject. Although not killed, nor in any way injured, a certain indignity has just been inflicted upon a member of the House of Commons, which should do something to show his colleagues how even a most harmless motorist is exposed to the carelessness and ignorance of anyone whom he may pass on the road. Mr. Alfred Davies went for his first run in a car to Sheringham, near Cromer, last week. All went well until they reached a village a few miles off Thetford, in Norfolk. There the driver stopped the car to lubricate certain parts of the machinery, and, whilst the engines were slowed down, a milk cart, driven recklessly by a youth, collided with a post in entering a gateway near by. The wheel was knocked off, and the lad who was driving forcibly ejected from his seat. A few minutes later the driver of the car re-started, and after going a few miles, Mr. Davies saw a policeman standing in the middle of the narrow road with his bicycle lengthways. The policeman demanded the name and address of the driver of the motor-car, and when asked as to the reason for his stopping the vehicle he replied that he had received a telegram saying that the automobile had collided with a milk cart and made off. It appeared that he was an inspector of the West Suffolk Constabulary, and Mr. Elliott, agent to Lord Iveagh, was the sender of the telegram. A few miles further on Mr. Davies was again stopped by two policemen on the same errand, and it was very clear to him, as a Parliamentary motor novice, that the carelessness of the police in these matters leaves much to be desired.

A Foretaste of the Future.

MR. A. E. ELLIOTT sends an explanation of the foregoing incident which, while showing he has no particular animus against motorists, illustrates the general readiness of the public to blame motor-cars for any mishaps that may happen on the road. He corroborates the M.P. in every detail save that he attributes the collision to the fact that the horse was frightened by the noise of the motor-car. Mr. Elliott sent his telegram on the evidence he received second-hand, and takes advantage of the occasion to warn motorists that under the new Act they would be liable to a fine not exceeding £10. Section 6 provides that a person driving a motor-car shall, in any case, if an accident occurs to any person on foot, horseback, or in a vehicle, or to any horse or vehicle in charge of any person, owing to the presence of the motor-car on the road, stop, and, if required, give his name and address, and also the name and address of the owner, and the registration mark or number of the car, and in default is

liable to a fine of not exceeding £10 for the first offence. We have italicised the word presence as indicating how very careful motorists will have to be, although we would remind Mr. Elliott that in the case which elicited the correspondence the motorist was not asked for his name or address.

The Emission of Steam.

As already intimated in these columns, the London County Council is actively interesting itself in the question of the emission of steam from light locomotives. In a case heard at the Lambeth Police Court on Monday, Mr. Helman-Pidsley, who appeared for the Council, mentioned that in consequence of numerous complaints of the sudden emission of steam from vehicles on the road, the police throughout the metropolis had been instructed to report all such cases. The Act makes the owner of the locomotive responsible, and according to the contention of the prosecuting solicitor, if a light locomotive emits steam, except from an accidental or temporary cause, the case comes under the Act of 1865.

Another Convert.

MR. SAMUEL SMITH, the governing director of Messrs. S. Smith and Sons, Limited, the well-known motorists' chronometer makers, is one of the latest converts to automobilism. His car is a 12-h.p. Clement, and his son, Mr. Herbert Smith, proved an efficient tutor in the art of driving. Mr. Smith, sen., has become quite an enthusiast, and may often be seen at the wheel of his car.

Mr. Samuel Smith on his Clement Car.

Restrictive Regulations Withdrawn.

THE Acting-Burgomaster of Antwerp has withdrawn the recently-made regulations by which motor-cars passing through the streets were limited to a speed of five kilometres an hour. The reason given for the withdrawal of the regulations is the fact that the festivities in celebration of the centenary of the Antwerp docks are now ended, and that consequently the town has resumed its normal aspect, and traffic is no longer congested. The real reason is, however, the outcry raised by motorists and manufacturers, who declared that motoring was impossible under these rules, and that an end to the motor industry would follow

their continued enforcement. The Burgomaster's proclamation, which notifies the withdrawal of the obnoxious regulations, points out that the regulations made in 1899 remain in force. These limit the speed of automobiles in country districts to thirty kilometres an hour.

Mr. Stanley and the Club.

FOLLOWING the criticisms of the Parliamentary Motor Party which were made in the official organ of the A.C.G.B.I. comes a copy of correspondence between the Hon. Arthur Stanley, M.P., and the Chairman of the Club, which unfortunately is too lengthy for publication. Mr. Stanley, however, protests against an alleged injustice done to Mr. Montagu in the journal of the organisation of which both are committeemen. He declares that the article voiced the views of a section, but not the ideas of the "great mass of sensible motorists." Such a statement can only be proved by a plebiscite of the Club; for the present, however, our own view is that the universal feeling—save among members of the Parliamentary Motor Party and their friends—is that it fairly well gauged the situation, and that the line taken by the Party in the House was distinctly unfortunate.

The Point at Issue.

MR. STANLEY criticises the statement that the Parliamentary Motorists accepted the Bill and adds that it was not for them "to accept or reject it, the decision obviously lay with the House of Commons." Of course that was so; but it was possible for Mr. Montagu and his friends to have voted against the measure, just as it was possible for them to vote for it—a way of showing acceptance. The point in dispute is that motorists were led to believe that the numbering proposals were a *quid pro quo* for the abolition of the speed limit, and that their position in that matter should have been made clear. Identification was secured, and when the speed limit was introduced no effective protest against such an arrangement was made.

Hard Words do no Good.

It is a pity that Mr. Stanley should have introduced into his letter such phrases as the "raving of a few extremists" to indicate the arguments of his opponents, and to describe as "ignorance and intolerance" the views of those with whom he differed. Motorists who could not see eye to eye with the Parliamentary Motor Party are denounced as having "raved and shrieked like hysterical old women," and yet Mr. Stanley wants to see the differences smoothed down—a rather striking way of beginning such a process.

Mr. Macdonald's Article.

ON another page we publish an article by Mr. Norman D. Macdonald, the chairman of the Scottish Automobile Club, which emphasizes the position we assumed some time ago. This article was written by Mr. Macdonald before he had read our leader of the 22nd ult., although it was called forth by Mr. Firth's reply to our own view of the situation. We are glad thus to find a confirmation of the attitude taken by the *Journal*, and trust that Mr. Macdonald's opinions will be carefully considered.

The Reliability Trials.

THE work of organising the forthcoming 1,000 miles reliability trials of motor-vehicles organised by the A.C.G.B.I. is well in hand. The competing cars must be within the goods entrance under the South Tower of the Crystal Palace by 12 noon on Tuesday next, otherwise they will be disqualified. Wednesday and Thursday will be devoted

to a series of brake, dust and noise trials. The daily runs start on Friday, the 18th inst., the programme being as follows:—

	Miles.
Friday, September 18.—Margate and back	150½
Saturday, September 19.—Eastbourne and back (Westerham Hill)	120
Monday, September 21.—Worthing and back (Bury Hill)	120
Tuesday, September 22.—Folkestone and back	139½
Wednesday, September 23.—Southsea and back (Hindhead)	144½
Thursday, September 24.—Bexhill and back	121½
Friday, September 25.—Winchester and back	133½
Saturday, September 26.—Brighton and back (Handcross)	91½

Vehicles will be started from outside the Crystal Palace at twenty seconds' interval in order of numbers, which will be secured by drawing lots for each day, the first car being started at 7.30 a.m. The drawing of lots will take place at the Crystal Palace on Wednesday next, at 12 noon.

Our Imports.

IN a previous issue we have given the Board of Trade returns with regard to automobiles for the month of July, and in our next number particulars of the August imports will be published. Some particulars as to the countries of origin in the former month will be of interest as well as of value.

valued at £8,192. Of 29 cars sent from Belgium to the United Kingdom, 18 were despatched from Ostend, 9 from Antwerp, and Brussels and Ghent sent one each. Thirty-nine motor-cycles were sent from Ostend, and cycle parts to the value of £3,186 from Antwerp.

The Turn of the Tide.

MR. W. B. PRITCHARD presided at the first ordinary general meeting of the Motor Manufacturing Co., Ltd., on Tuesday, when the shareholders were evidently gratified at the state of affairs disclosed in the balance-sheet. The payment of a dividend of 5 per cent. on the shares was approved. Mr. Mark H. Buckea was re-elected a director, and the chairman, directors and secretary (Mr. A. Burgess) thanked for their services.

Motor-Omnibuses.

REPRESENTATIONS are being made for increasing the facilities for communication between Haslemere and Farnham. A petition is about to be presented to the railway company asking them to institute a motor-bus service between those two places, via Frensham, Headley, Grayshot, and Shotermill, to

Photo by)

The Joint Meet of the Manchester, North-East Lancashire, Nottingham, Sheffield and Lincolnshire Automobile Clubs at Buxton.

(R. Banks.

From Christiania came a cargo the Scotch port of Grangemouth—an isolated instance that is more curious than valuable. From Holland the receipts at English ports comprised twenty cars and a motor-cycle, the value of the former being recorded as £4,590, and the bulk of the exports coming from Rotterdam. Germany sent fourteen cars from Bremen. The value of the cars from the United States was over £8,000, New York sending thirty-five and Boston eight, the former port also exporting parts to the value of £1,455, and a small export of tyres being separately classified in the Customs returns.

From France and Belgium.

SOME interesting comparisons can be made with regard to the exports from French ports. Thus 209 cars were exported to this country from Boulogne, their value being £66,447 as compared with 201 cars from Dieppe, valued at £88,860—an average from the latter port of £442. From Dieppe and Boulogne alone came parts totalling £6,300. Calais sent 48 cars valued at £20,651, and from the ports of Havre, Honfleur, Rouen, Dunkirk and Treport we received a total of 28 cars

run at regular fixed times. The matter has been discussed by the Council at Haslemere, who will forward the petition. At St. Dennis, in Cornwall, notable for the Cornish clay industry, an agitation is being promoted for a motor-car service. In Devonshire and elsewhere, the example of the Great Western and North Eastern Railway companies is inspiring local men of influence to commence agitations for the extension of the idea, while hardly a day passes when we do not hear of some Irish public body or other adopting a resolution hoping that its area may shortly have the benefit of a public motor service. Evidently the time is coming when such will be secured on a remunerative basis.

Closing the Roads.

AFTER considering a similar matter at a public meeting at Yateley, in Hampshire, it was resolved to petition the L. and S.W. Railway to run a motor omnibus from Eversley, Blackwater, through Yateley and Hawley, to Farnborough Station and back on the mornings and evenings of all days except Sundays. Unfortunately this decision was coupled with

a resolution to petition the Hampshire County Council to place a limit on the speed of motor-cars on certain roads in the parishes of Eversley and Yateley. This question of closing roads should have been deferred until the people have seen the motor-vehicles in regular operation.

A Case at Perth.

THE Town Council of Perth has prohibited motor-cars and carriages being driven over that part of the recreation ground of the burgh of Perth known as the North Inch, without the written permission of that body. The other day Dr. Walford Bodie innocently ventured across the way, and had, in consequence, to appear in the local police court. Asked if he had anything to say in mitigation, the doctor replied that he had nothing except that he regretted having offended. It was quite innocently done. He saw carriages had been there, and in the morning observed a carriage proceed up part of the drive. He drove round to see if he could get an opening, and he found a big opening and drove right along the Inch. He came out again, and no one said anything to him. On Tuesday he again came along the drive. There was no notice that he saw prohibiting carriages or motors from driving there. Afterwards he saw a board, but it was too high for him to read it. Bailie Barlas said the town council had framed bye-laws, and they had received the approval of the Secretary for Scotland. In the circumstances he thought the case could be met with a fine of £1, with the alternative of fourteen days' imprisonment. Notice boards in such places should be properly fixed, so that they can be read with ease, and we mention the matter now to remind the provincial clubs and other interested bodies to carefully watch the Local Government Board regulations on this point.

The Herefordshire Club.

ANOTHER automobile club has been formed, viz., the Herefordshire Automobile Club, of which Mr. J. T. Hereford has been elected president, with Mr. Wilfred Groom, of Wroxeter, Hereford, as secretary and treasurer. We are glad to welcome this addition to the organisations now being formed throughout the country for the purpose of social intercourse among motorists, and also, if necessary, to keep a watchful eye on the doings of local busybodies who may seek to harass those who own cars.

Motor Volunteer Corps.

A SERIES of staff rides in preparation for the manoeuvres have been organised for the last six week ends, and have been very largely attended by officers and members of the Motor Volunteer Corps who anticipate taking part in the manoeuvres. Great keenness has been shown by the members in tracing out and driving over the roads allotted to them, and conspicuous punctuality and regularity has been demonstrated in arriving at the points of concentration, while considerable soldierly aptitude and discernment has been shown in the excellent road reports sent in. On last Saturday's ride the detachment were in the uniform of the corps, and turned out very smartly on parade in the High Street, Marlborough. The corps goes into its quarters at Marlborough and other points in the manoeuvre area to-day (Saturday).

Police Object to Publicity.

AN interesting dialogue occurred at the Kesteven Court at Lincoln the other day, when four prosecutions for exceeding legal limit came before the Bench. The solicitor for the defence naturally inquired the method of signalling adopted by the police to secure their evidence, but the superintendent objected to the public being permitted to know the methods that were adopted. The chairman of the Bench, however, expressed the desire to get to the bottom of the motor cases, and pointed out that a few days before a doctor had been pulled up

on his way to see a patient. In the second case the defendant was pushing his automobile up the hill, and the magistrates had to acknowledge that they did not think it was much of an offence. The policeman was on the top of the hill, and the evidence was not very satisfactory. They, however, came to the conclusion that they must convict, because the defendant was exceeding the legal limit, but they reduced the fine to one shilling. Evidently it was not a case to take into court at all. If, however, such was the fact, why did they mulct the defendant in the sum named?

An Inter-Club Meeting.

ON Saturday last contingents from the North-East Lancashire, Lincolnshire, Sheffield, and the Nottingham Automobile Clubs had a week-end run to Buxton in order to meet there the Manchester Club, making the Empire Hotel their headquarters. The cars began to arrive shortly after 4 o'clock and took up their position in the spacious drive in front of the hotel. The total number of motor-vehicles taking part in the run was 45. The members of the various clubs met together after dinner in the smoke room and exchanged opinions on such matters as the new Bill and affiliation. Before lunch on the Sunday a number went in their cars to different points of interest in the neighbourhood. After luncheon Mr. L. G. Schwabe, one of the committee of the Manchester Club, proposed a toast to the success of automobilism. The Vice-President and Hon. Secretary of the Nottingham Automobile Club supported it, and the toast was drunk with enthusiasm. After lunch the cars began to disperse, only two or three remaining over until Monday morning. The only disappointment was that owing to runs having been arranged on the same date the Yorkshire and Midland Clubs were unable to join in the run to Buxton.

A PETROL motor hose cart has just been supplied by Messrs. Merryweather and Sons to the Capetown Fire Brigade.

MESSRS. DE DION AND BOUTON are building a 30-h.p. steam water cart for the municipal authorities of Paris.

A PETITION for the compulsory winding up of the London Motor Omnibus Syndicate (Limited) has, by consent, been dismissed.

A BILL regulating motor-car traffic throughout the German Empire is to be introduced into the Reichstag by Count Posadowsky, Minister of the Interior.

THE MOTOR CYCLING CLUB run on Sunday, the 13th inst., will be to the Bedford Arms, Woburn. Meeting place 11.15 at the Old Salisbury Arms, Barnet; lunch at 1.30.

THE Automobile Club de Namur and Luxemburg is organising a tour into France for the end of the present month under the guidance of Baron Pierre de Crawhez.

A POSTAL motor-car has been secured from the General Motor-Car Company, Limited, by the General Post Office, and is now travelling fifty-eight miles daily in the metropolitan area.

THE Automobile Club of Avignon, being unable to organise its annual hill-climb, is organising in its place an excursion to the observatory on the summit of Mount Ventoux for the 24th inst.

AT Warrington, Mr. Bellian stocks petrol and motor-car accessories at his place in Sankey Street. He has an excellent plant for repair work, and is recommended by well-known motorists who have toured in the district.

UNDER the name "Marlborough" the Pall Mall Autocar Company have introduced a new four-seated car. It is fitted with either a 6-h.p. De Dion or a 6½-h.p. Aster engine, and has three forward speeds and a reverse controlled by a single lever.

MESSRS. KELLY, B. UMPEY and COMPANY have arranged for their garage in Market Street, Birkenhead, to be open day and night. Repairs can be executed at any hour. They also stock petrol, oils, etc. Being close to the ferry, motorists will no doubt find this garage convenient when too late to cross into Lancashire.

AN "ACT" OF DISCOURAGEMENT.

BY NORMAN D. MACDONALD.

MY friend, Mr. Staplee Firth, knows me well enough to know that I am making no attack on his genial and able self if I use him as a whipping-post to impress certain points and recall certain things, as to the doings of a number of well-meaning folk, some from that dangerous love of compromise—the one thing which in many ways has cost Great Britain so much—some from undue haste and impatience, and some from a childlike innocence, which led the A.C.G.B.I. into a false position, and the whole of us into a mess. The bland faith and innocence of those who thought they had pocketed a Government by the remarks of some Cabinet Ministers, and could control the Parliamentary den of lions by entering it with their hands full of compromises, was incredible. What rabid ignorance, spite, false conservatism, and a true British hatred of progress was capable of they might have judged by the continuous and unconcealed prostitution of the Seat of Justice in all parts of England—by men sworn to do justice, but who had often so little control over their rabid minds as not to have the decency and dignity to at least conceal their shame by holding their tongues. Or they might have been warned by the torrent of nonsense and abuse in letter and article in otherwise sane and honest journals, and signed by men of education and position, not to mention County Councils, and minor meetings of all sorts.

I only rake up the past in order that we may not be led so softly and falsely in the future. We want policy, principle, and backbone. I don't mean we should fight and defy or do anything not fair and gentlemanly. But the descendants of the men who opposed stage coaches and early motor-cars by violence, and railways and bicycles by all Parliamentary and legal means, and by stupid, ignorant stuff on oath, are not to be converted by a turning of the cheek to the smiter. They will best learn the sensible side by time, and by those who do know their subject boldly standing on principles and educating them by carrying a war of facts in uncompromising geniality into their camp.

Mr. Staplee Firth once again seems to defend the giving away of the first important principle—that a private carriage should neither be numbered nor licenced to run, unless all kinds are. And this, forsooth! because there be blackguards about. On the same lines I could argue more strongly the other way. The fact that there were gross miscarriages of justice in abundance, and deliberately too, was a real reason for not aiding such scandals by either making it easy for all drivers to be persecuted, or putting a stigma on motor-cars and so making an official notification (as it were) that these vehicles are in themselves extra dangerous, or their drivers extra wicked, and hence that the whole thing wanted marking down, and a severe control. The country swarms with blackguards of all sorts who would be better shipped to the Sabara in the public interest, but no one has yet ventured to say that folk should be labelled and licenced to go about in order that these gentry may be known to the police and tracked from point to point. Our ideas of the liberty of the subject are wide enough yet to save even the worst convict from being made conspicuous *pro bono publico* on release. The number of "road hogs" who are a real danger is extremely small in proportion, and the police and the law could have dealt with them, just as it does with any public danger, if it were necessary. With all respect, I fear Mr. Firth, when he careers around, is a "road hog" in the eyes of the folk who have got up the hue and cry—and of all the other ignorants.

The statement that "the Club" considered numbering, etc., the only means of getting rid of the "road hog," I venture stoutly to deny. The Club never had any chance to discuss or give views on the matter. We were told over and over again that if we would swallow a principle we would get no speed limit, not abolition of "road hogs." And I go further and say that "the Club," as a whole, did not want the matter opened up at all, and certainly did not want numbering, etc. I know all about

the vote. This was put off and off until we knew the Government had a Bill for certain, when all interest in the old question was lost, and a very small vote took place, because most automobilists knew the only real point was what was in the Bill, which was, after all, a matter beyond the Club's control. Even the useless vote was taken on false issues. Instead of a straight point on a principle, we were asked to vote for numbering, etc., "provided" three things, I think. One of these was the utterly impossible idea that Parliament would deliberately undo a high legal decision. Another was an extraordinary proposed attempt to introduce a very bad principle indeed into law, and especially criminal law—viz., an appeal on facts. On principle, for the good administration of justice, points of fact should be left solely to the Court which has seen the witnesses and heard them cross-examined. In any case, as I understand (feebly) the archaic law and procedure in England, I fancy the appeal may be only from a few amateur and narrow-minded justices to a sort of meeting of the same. The looseness of the procedure, the so called "evidence," and the generally off-hand and truculent procedure in inferior Courts in England is an astounding mystery to a Scotsman, and specially to a Scottish lawyer. It only shows in another way the vast conservatism and worship of "what has been" which enables an Englishman to be content with, nay proud of, institutions and procedures thereof which are harmful and oppressive in many ways.

But the movement to vote for branding ourselves, baited as it was with impossible and undesirable things (which a kind Parliament was to grant us as favours in legal matters such as no other section of the community enjoyed before the law and the Courts) was forced down our throats by a circular signed by many honoured names in all walks and ranks of life who formed the Legislative Committee. I venture to say that very few of these noblemen and gentlemen had ever met to go into the subject, even if they were qualified to understand legal and Parliamentary points, and the future results of any enactment. Moreover, the circular was signed by some who were openly opposed to numbering, etc. I doubt not they did it either to please others or to seem unanimous, or in hope that they were doing the best for us all round, and misled by the impossible "provided that," perhaps. But it was hardly fair to the ordinary members to parade all these honoured and great names as if they had deliberately considered the whole matter and come to a solid conclusion.

Events have proved all too strongly how wise was the admonition addressed by the Scottish Club to the A.C.G.B.I. that it was most unwise to go playing with fire by stirring up the Legislature, and that the true and safe position for the Club was to "watch jealously any attempt to alter the present law." In fact, we should have entrenched ourselves and awaited the enemy, and used every exertion to postpone more Acts of repression, knowing that every day meant more recruits, more public knowledge, and every month more motorists in the two Houses.

The funny thing now is to note that few motorists see the real dangers and hardships ahead. All our rage and doubts and fears seem to revolve round the same speed limit point. If our furious and blind enemies are at all wise, they will not bother themselves *re* such a petty thing as the speed limit and its fines, etc. Parliament has actually put in the fore-front of the Act, first, the suggestion that we are likely to be dangers, and then gives unprecedented powers and pains and penalties to enable us to be held down and persecuted by the very men in power, whose wish and intention openly is to drive out the new thing or to make it crawl.

Because, note, that the £20 and £50 fines, and three months imprisonment, are placed in the hands of a couple of old-wife J.P.'s, on the evidence of any pair of those hysterical persons who shriek about dangers and talk of furious and reckless driving where such is only the vain imagination of their fussy, or horsey, or prejudiced, or generally dense and ignorant minds. The "speed," or "manner which is dangerous," or "recklessly," or "negligently," the "circumstances" of real or imaginary traffic,

the "nature," "use" and "condition" of the highway are points which give the prosecution and the persecutors on the Bench every possible help and hint to find such facts proved in order to come down promptly with a fine or sentence in line with their desires. What little quibbles will be sufficient evidence and proof of danger, recklessness, etc., we may guess from the drivelling nonsense poured forth in the press and Parliament. And what chance of a fair trial will a man have who appears before one of these petty courts with the conviction of another ditto endorsed on his permit to do the acts of a free citizen? In Scotland the utmost care is taken that a calm, hard-headed jury shall know nothing of the previous convictions of the worst convict brought before it. And there are no petty prejudices in a Scottish jury. Worse still, on the third conviction, for any offence connected with a motor-car, the court can, in addition, absolutely prevent a citizen from doing an act of ordinary life and freedom for as long as it chooses. So far as I know not even ticket-of-leave men are so far deprived of ordinary liberty. Such a power against the doing of a thing belonging to legitimate freedom has never even been given to the highest Courts. It is monstrous, and a subversion of the primary principles of liberty.

I, of course, speak of England mainly. Scotland can look after itself, and will, in any case, keep its head and not really impede progress. Luckily our law is administered by paid and trained servants of the Crown, who are assisted by Public Prosecutors of the same position, and both of whom work together not to persecute but to get at the truth and deal fairly; and these advocates who fill the local chairs of Justice have only the welfare of the public and the dignity of the Bench as their aim. We are not cursed with the iniquitous system of a policeman prosecuting, or of a private person doing the same, or hiring an able advocate to do it for him. But the main struggle against ignorance, prejudice and persecution must go on in England, and I suggest the following as the main plan of campaign for our side:—

1. The formation of a big fund with which to fight every case and to appeal, using good solicitors and barristers who can press the matter firmly, calmly, and fully on the Courts, and handle the witnesses, of enough experience and address to prevent themselves being browbeaten by the bench or prosecution. Alas! there can be only one Staplee Firth, and he can only be in one place at a time. But with money the Club could command good men, who would soon learn the points for all cases where the party could not well pay himself. No legal stone should be left unturned, and the Courts made to hear each case and every appeal at full length.

2. The fund also to be used for a vigorous prosecution of all the horse breakers of the law—specially those cases of driving on the wrong side, horses not attended, training horses on the roads, showing off horses to purchasers on the road, and so on.

3. Motorists should, whenever fair, carry the war at once into the enemy's lines by giving notice that they intend to proceed by criminal information or by civil action against the other party, and follow this up by a complaint to the police or by a letter from a solicitor. Take the case of the very harsh and false position provisions of Clause 6, wherein everything is laid so that in the case of a horse accident, the driver of any motor-car within sight is assumed to be to blame. In most cases it will frighten off persecution if the motorist goes for the horse party and lets him know that he will denounce him for having a dan-

gerous horse on the highway. If there is a collision and damage to the car, at once threaten damages and follow up with a demand per a solicitor.

4. The motorists in Parliament should ask questions about any gross injustice to the Home Secretary, the Lord Advocate of Scotland, and the Chief Secretary to the Lord Lieutenant. Plenty of cases will arise where the same Court will fine wife-beaters, drunken, furious horse-drivers, and gross cruelty to animals or children fiends a few shillings, and then some motorist a great many more pounds under the imagination stimulated by Clause 1. Every case of injustice or inequality or marked revengefulness should be held before the public per Parliament.

5. The motor-car party should introduce, and press upon Government, Bills to prohibit persons under seventeen from driving horses; compelling all vehicles to show front and rear lights at night; identification plates and numbers on all carts, vans, etc., going faster than a walk (showing front and rear); restricting all tramcars to ten miles an hour maximum; imposing higher minimum penalties for being drunk in charge of a horse, having untrained horses on the high road, leaving horses unattended, and the like. Other points to make it lively and in the real public interest will occur. Why is the general law compelling 9 ft. 6 in. between the tram lines and the kerb so regularly over-ridden?

A Motor Meet at Dessau, Germany.

Automobil Welt.

What makes one so warm over the whole business is that Parliament has deliberately set its seal to the thing as specially dangerous or noxious, and thus set back, and perhaps for ever restricted, what is not only a safer mode of transport but the one most able to benefit the whole community, if it had been given scope, and also that we should have unwittingly helped it all by the well-meant but confiding or hasty weakness of a few men who seemed blind to the dangers certain to come

unless fresh legislation were not only not talked of, but kept back as long as possible.

The only gleam of humour in the thing is that the twenty miles an hour absurdity will compel kings, princes and governors, judges and magistrates, nobles and men of estate, and even common M.P.'s, to be daily law breakers, when they are at the same time doing no harm whatever to anyone.

If the Legislative Committee was really playing so low as making "the Club" seem to take upon itself the *ultra vires* nonsense of exterminating a few vermin by putting the whole of us as marked victims before the whole enemy and giving away a great principle of private life, it should have said so clearly, in place of trying to make us believe we could get unlimited speed if we agreed to be branded. Then things would have been focussed and the Committee asked to devote itself to practical politics and leave the few "road hogs" to the certain consequences of their actions if they really caused accidents. The pains and penalties and damages of daily criminal law are always heavy enough to protect the public from any serious menace. Judge and jury might have been trusted to make the punishment (and damages) fit the crime.

A PUBLIC motor-car service has just been started on the island of Corsica, between Bastia and Cape Corse.

THE President of the German Automobile Union has issued a circular urging the members to observe more carefully the regulations with regard to motoring in Berlin.

CONTINENTAL NOTES.

BY "AUTOMAN."

—✕—

THE motor-boat race from Paris to the sea, which "went up like a rocket," has "come down like the stick" through a complete want of organisation or rather want of knowledge on the part of the organisers. The Paris or river end of the competition went very well, but as the sea was approached it became painfully evident that the race was in the hands of "land lubbers," who completely ignored such insignificant matters as tides, tidal basins, ebb and flow. Last week's *Journal* left the competitors at the end of their first day's journey at Mantes on Sunday evening. On the Monday morning the first boat got off at 6.33 a.m. Just after the start an accident occurred to an automobile wagon which had been provided by M. Védrine to carry luggage for those on board the competing motor-boats. The wagon was being driven by a negro in the service of M. Védrine, and was loaded with a nondescript lot of portmanteaux, valises and hat boxes, and sundry parcels, and was placed back on to the river at a spot where there was a sheer drop of about five yards from the quay to the surface of the water, which was 12 feet deep. The coloured driver, not realising how near he was to the water, put in the reverse motion and plunged

the first time there were no locks to go through. Here, however, the sea began to make itself felt. The start should have been made at 11.30 in order to arrive in Rouen ready for a mile race which was to take place at 2 p.m. The tide, however, had been forgotten, and the start had to be put off until 1 p.m., the last boat getting off after 2 o'clock. The boats should have been handicapped at Elbeuf, and there was to be a kilometre race at the start for a cup given by the Elbeuf municipality, but the timekeeping organisation for the handicap and the kilometre were so hopelessly imperfect, and the times as worked out so fantastic, that Tampier refused to give them out officially, and both events were relegated to the shades of Nimbo.

At Rouen the harbour was decorated, and the mayor and the general commanding the district and a great many distinguished people gathered to welcome the motor-boats, and to witness the mile race, which was put off until four o'clock in the afternoon. As on the preceding days the Mercedes was an easy victor, and it also won the mile race, doing the distance down stream in 3 minutes 33 2-5 seconds. In the evening a Venetian fete had been organised, but an altogether untoward and unrehearsed event rather dampened the ardour of the visitors. Just at the conclusion of dinner at the Hotel d'Angleterre, which faces the quays at Rouen, in the busiest part of the port, for some inexplicable reason a crowd of dock loafers crowded

The Start of the Paris-Trouville Motor Boat Race.

calmly but definitely backwards right into the river, where, still holding on to the now useless steering wheel, he went down to the bottom and was completely lost sight of until he reappeared spluttering and shouting for help amidst a medley heap of floating bags and hat boxes. Two passengers who were in the wagon had time to jump on to the quay before the negro went over with his load. The driver and the floating baggage were fished out slightly damaged by water only, and later in the day the wagon was hoisted up from its watery grave. M. Védrine, who was on board his motor-boat, heard of the accident at Port Villy and gave up the race, but later, having heard that the results were not serious, followed in a motor-car which had the damped baggage on board, and joined the whole party at the Hotel at Elbeuf, where the wet clothes were all hung up to dry and gave the place the appearance of an old clothes shop.

THE day's racing was almost without change in the relative positions of the boats and almost without incident, the Mercedes being an easy winner and covering the 109 kilometres (67 miles 6 furlongs) in 3 hours 29 minutes 42 seconds, more than half an hour ahead of its competitors. A crowd awaited the arrival at Elbeuf, where the official timekeeper, Tampier, anchored out in a punt, took the times under a tropical sun.

THE third day's course lay between Elbeuf and Rouen, over a distance of only 22 kilometres (13 miles 5 furlongs) and for

round the hotel, bombarded the guests with all kinds of projectiles and used insulting language to the ladies, and a battle royal took place before the police turned up to re-establish law and order.

THE fourth day of the motor-boat race consisted of a journey of 62 kilometres (38 miles 4 furlongs) from Rouen to Caudebec, which is the place where the tidal wave in the river Seine makes itself most felt, mounting, at certain tides, many feet above the normal surface of the water. The weather was very fine for the start, which was made from 10 to 11 a.m., and it held up all day, getting gradually threatening towards the evening, when a heavy rain storm took place. The competitors kept nearly the same relative positions, the Mercedes being still unbeaten as a racing boat, and the Narval always at the head of the cruisers.

THE fifth day should have consisted in a journey from Caudebec to Havre via the harbour of Honfleur, along the navigable channel of the river Seine, arriving at Honfleur at about noon, but at this time the harbour in question, owing to the ebb tide, was a sea of mud, and the few spectators who had come to see the arrival of the motor-boats at once recognised that they could not come that way, and that they must have been forced to take the Tancarville Canal, and this turned out to be the case; but to add to the difficulties, the boat which was carrying Tam-

pier, the official time-keeper, drew too much water to get past Tancarville at low tide, and so, as there was no automobile or other means of transporting him, he did not arrive at Havre until late in the night. The motor-boats arrived at Havre without incident, but the public in crowds waited for them on the jetty, whilst they actually arrived in quite another part of the basin, the Mercedes leading, as usual.

THE sixth and last day of the Paris to the sea race should have consisted in a triumphant arrival at Trouville, across the estuary of the Seine opposite Havre, but, alas! there was a change in the time of starting from Havre, and the boats arrived at Trouville at half-past-eight in the morning instead of at two in the afternoon, and although there is both telegraph and telephone between Havre and Trouville, the organisers of the race had completely forgotten to inform Trouville of the change of plans. Monsieur Hoe, the sympathetic Mayor of Trouville, who is a great sportsman, intended to give the motor-boats an official reception, and the "Auto" says that after the boats had arrived he was informed of the fact by a "mud-lark" from the harbour, and was very naturally furious.

AT Trouville there were races on the following day, first of all over a nautical mile, and then over a three-mile course, for a

the other way round, that is to say, from the sea to Paris, when the true racing qualities of the competing boats would be brought out at the end, and the race would be much more exciting and interesting to the spectator, whereas from Paris to the sea it is "all over but the shouting" long before the arrival at Trouville. In any case, the organisers of the event are to be congratulated on the idea of such a race, and no doubt the experience they have gained will enable them to avoid mistakes another time.

THE Gordon Bennett cup race will be held next year on roads in the neighbourhood of Homburg, and the Emperor of Germany is taking personal interest in the event and will in all probability be present at the winning post. The German team will be made up of two Mercedes cars, and there will be eliminatory trials for the third place. Three firms have sent in a request to compete; they are the Benz Company of Mannheim, de Dietrich and Company, and the New Automobile Company of Berlin. It is suggested that the eliminatory trials should be held on the sandy sea shore of the north-eastern end of the island of Usedom, where the sand is quite hard enough to support the weight of the heaviest car. There is a course there of fifty kilometres in length which is frequently used by automobiles. The road is flanked on one side by precipitous cliffs

The Paris-Madrid Tour.—At Cahors, France, the Bishop inspected the Cars.

[Le Chauffeur.

cup given by Gaston Menier. The two races were both easily won by the Napier motor-boat, which was sent over too late to do the whole journey from Paris to the sea, but which arrived in time to completely take the shine out of the Mercedes, which had hitherto been triumphant all along the route. In the mile race the Napier took 3 minutes 33 seconds, while the Mercedes took 3 minutes 50 4-5 seconds. The Gaston Menier Cup which was won by the Napier is a cup given exclusively for boats completely of French manufacture; however, in order to add to the interest, the Napier and the Mercedes were allowed to compete, so that the cup is now held by a boat of purely English manufacture, whilst the second in the race was the Mercedes, of which the hull only is of French manufacture.

AFTER the Paris to the sea race was completed, it gradually oozed out that the measurements and classifications of a great many of the competing boats were wrong, and many protests were lodged which it will now be very difficult to settle. It is quite evident that the race was undertaken without the experience or care required for such an event, and should there be another such race next year, no doubt greater precautions will be taken. It would also be better, in my opinion, to hold the race

and on the other side by the sea. Another suggestion is to hold the eliminatory trials on a 250 kilometre course along the uninhabited shores of the Gulf of Dantzig, between Dievenow and Putzig.

FROM another source the news comes to hand that the Homburg course chosen for the 1904 cup race is over very bad roads, with sharp curves abounding, and also dangerous hills.

LAST week I indicated an automobile excursion to Compiègne. About ten miles south-east of Compiègne is situated the town of Pierrefonds, where the chief object of interest is the ancient feudal castle, which was destroyed at the same time that all the castles in France were destroyed to prevent the barons and feudal lords using them as fortresses against the King. The castle of Pierrefonds was completely rebuilt and restored under the Napoleons by the famous architect Le Duc, and it is now the finest specimen extant of a mediæval castle, complete in every respect and well worthy of a visit. The road from Compiègne to Pierrefonds cuts through the heart of the forest in a straight line, commencing at the Carrefours Napoleon, where you take the left hand road; the surface is perfect, and you may indulge in the highest speeds until you reach the town of Pierrefonds and

see the mighty battlements of the castle towering above the town on the side of a pine clad hill to the left. You will find garages and every accommodation in Pierrefonds, and you will be well looked after in the Hotel des Bains if you decide to make a stay and try the effect of the sulphurous waters of the lake.

FROM Pierrefonds to Paris is about eighty miles, and through lovely country. You leave the castle on your right hand side and take the road leading to Retheuil and Tailfontaine, after leaving which village you turn to the right up the hill and through heavily timbered country into Villers Cotterets, which is situated on the border of a forest of the same name. Villers Cotterets is about twelve miles from Pierrefonds and is the birthplace of Alexandre Dumas, who wrote the famous "Three Musketeers," and to whom there is a monument in Villers Cotterets. On arriving in the town turn sharp to the left, and go right along past the statue of Dumas and over a level crossing on to the road which leads to La Ferte Melun. When you first arrive in the main street of Villers Cotterets beware of the right hand road, which also leads to La Ferte but which is very badly paved, and insist on crossing the village and passing the statue. La Ferte Melun, the birthplace of Racine, is about nine miles further on, and you had better take in petrol there if you require it, as you are not likely to find any more until you reach Meaux. The writer found himself without any on this road and had to be contented with two litres of lamp oil, which took him along in fine style. At La Ferte Melun you cross the river Ourcq and the Eastern Railway, and after going through the main street of the town, turn sharp to the right along the main road towards Meaux, which is some thirty miles further on. The road passes along the lovely valley of the Ourcq, over a veritable switchback railway with beautiful views developing on the ascent of every hill. On the road to Meaux you pass through the villages of Bourneville, Mareuil-sur-Ourcq, Neifchelles, May, and Gue-a-Tresmes. At Meaux there is a cathedral dating from the 12th century, and with a facade that will repay a visit. From Meaux into Paris is a distance of about thirty miles, and there are several different roads, but the one I should recommend goes due south along an almost interminable avenue of big trees to Saint Germain-les-Couilly, where you turn to the right and make for Chessy, up a steep hill on a long curve in the road. From Chessy you make for Lagny, which overlooks the valley of the Marne. After Lagny, you pass through Bussy, Torcy and Champs, all overlooking the river Marne, and on to Noisy-le-Grand and Bry-sur-Marne, where you keep to the left up the hill instead of following the tram lines and crossing the river as the main road does. This brings you direct to the bridge which crosses the Marne and leads you into Joinville-le-Pont, where you keep right on up the hill and avoid the turning to the right, which leads you into the thick of the town. In a few minutes you are in the Bois-de-Vincennes, where you keep along the Avenue de Gravelles until you reach the Rue de la Republique, on your left, which leads over the railway lines and down to the banks of the Seine, where you turn to the right and keep the river on your left, following it along to the Octroi gates, where you declare your petrol, and go on along the river without leaving it until you reach the Place de la Concorde.

THERE was much excitement in the square in front of the Cathedral of Notre Dame on Monday last, when Madame Lockert set out on a 14-h.p. Tony-Huber car on a journey from Paris to St. Petersburg. The intrepid *chauffeuse* expects to make the trip in easy stages in about three weeks.

THE Semmering hill-climb organised by the Austrian Automobile Club will be held to-morrow (Sunday). In the motor-cycle class there are fourteen entries, while among the racing cars are four 60-h.p. Mercedes, three De Dietrichs, a Lohner-Porsche and a Regent.

THE Automobile Club de Spa held its first race meeting last week end. The proceedings on Saturday opened with the Mal-

champs hill climb over a distance of 5 3-5 kilometres. Rigaux on a Sarolea (Kerry), won the light motor-cycle class in 4 min. 30 1-5 sec. Pilette on a De Dion tricycle was first in the heavy motor-cycle category (time 5 min. 37 4-5 sec). The light car class was carried off by Pirmez on a Delahaye in 4 min. 51 1-5 sec. The mile trials, standing start, on the Malchamps Hill were next run off. Rigaux (Sarolea) was again successful in his class (time, 1 min. 33 3-5 sec.); Barbaroux on his Benz Parsifal car was first in the light car class and in the general classification (1 min. 20 sec.). The Coupe de Spa thus goes to Barbaroux, who has, however, to win it two years in succession ere it becomes his own property. The event on Sunday was a race for touring vehicles from Spa to Sart and Niveze, and back to Spa. Lambert on a Panhard won the four-seated car category, Madame Lehman on a Metallurgique the five-seated vehicle class, and Bidault on a Dechamps the two-seated car section. Monday was devoted to a driving competition, the meeting being brought to a close by a banquet in the evening.

THE MERCER TUBULAR WHEEL.

WHILE artillery wood wheels are now almost exclusively used on motor-cars in this country, a number of American manufacturers give their preference to tubular steel wheels, one type of which—the Mercer—is illustrated herewith. The Mercer tubular spoke wheels manufactured by Messrs. F. J. Mercer and Co., of Hyde Park, Mass., are made in sizes from 28 to 36 inches in diameter, and can be fitted with either pneumatic or solid tyres. The spokes are of steel tubing oval in cross section tapering slightly toward the hub. They are fitted into a peculiar shaped pocket in the hub and are securely fastened to the rim by a special forging

braced to the spokes. This is fastened to the rim in such a manner that each spoke is held in an independent pocket of which the flanges form a part. To remove a broken spoke it is only necessary to detach the flanges at the rim end and pull the spoke out of the hub by means of a special jack furnished with the wheel. In replacing a spoke the jack is used to force the spoke into the hub pocket. The whole operation of removing and replacing a spoke is said to require not more than ten minutes. In assembling the wheels they are held firmly in a jig and set up upon their own bearings. The spokes, being of steel, are claimed to be unaffected by climatic changes, so there is no liability of the wheel getting out of truth.

The "Wantage" Steam Wagon.

STILL another addition to the list of steam wagon builders in this country has to be made, the Wantage Engineering Company, Limited, of Wantage, Berks, having lately taken up the construction of this type of automobile. The vehicle, of which we give an illustration herewith, is intended to carry a load of 4 tons. The underframe is of channel steel, stayed with cross channels and angle plates, and riveted up throughout. The boiler can either be of the water-tube or the fire-tube type, having eighty square feet of heating surface, fitted with steel tubes, and built for a working pressure of 200 pounds per square inch. The safety valve provided is set at 225 pounds. The boiler is constructed so that the outside shell can be taken off for cleaning purposes. Coke is used as fuel, and the fire is regulated by a hinged ash-pan, and also by a lid covering the central firing shoot. A "Klinger" water gauge is fitted; as will be seen, the boiler is placed in front of the driver's seat, and the coke bunkers are on either side of the same, the latter holding sufficient fuel for an ordinary day's work. An automatic pump, fitted with double check valves to both suction and delivery, is driven by the eccentric from the compensating gear-shaft. There is also a small steam pump for supplying the boiler when the engine is standing. The latter is of the horizontal compound reversing type, having cylinders $3\frac{1}{2}$ in. and $6\frac{1}{4}$ in. by 6 in. stroke, and running at 500 revolutions per minute. The engine is entirely cased in and dust-proof, runs in oil, and requires little attention. The transmission gear is adapted to give two changes of speed. The gear-wheels are bolted to turned-up flanges, thus dispensing with all keys. The drive from the end of the compensating gear shaft is taken by roller chains to the felloes of the wheel, instead of to the spokes, thus relieving the latter of strain. The compensating gear shaft is of special construction, being hollow from end to end; a bolt is put through this shaft which takes the end thrust caused by the bevel wheels off the bearings, thus considerably reducing the friction. The compensating gear can be locked by an internal clutch arrangement by pulling a lever under the frame of the vehicle. A point worthy of note is that not only are all parts made to gauge and template on the interchangeable system, but all the castings are numbered, making it easy to obtain replacements. The water tank has a capacity of 130 gallons. The long platform is entirely independent of the working parts and the main framework of the vehicle; it measures

12 ft. 6 in. by 6 ft. 5 in., giving 75 sq. ft. of available space for goods. The road-wheels are of the artillery type, with oak spokes and ash felloes, steel naves bushed with hard gun-metal and weldless steel tyres. The front wheels are 2 ft. 10 in. dia. by 4 in. tyre width, and the rear wheels 3 ft. by 6 in. One of the "Wantage" wagon has been on the road for six months, and as a result of the experience thus gained the makers state that the vehicle is capable of doing a journey of fifty miles in a day of twelve hours, loaded with four tons, on fairly good roads, and it can also carry a full load and haul a trailer loaded with two tons with ease.

MESSRS. LAFAYETTE, LTD., have prepared a set of thirteen pictures fully illustrating the Gordon Bennett race.

THE See Motor-car Supply Company have opened a garage, with accommodation for thirty cars, at 151, Oxford Street, W. Petrol, oil, and motor accessories are kept in stock, and facilities are available for washing and repairing cars.

MESSRS. FRISWELL, LIMITED, inform us they have been appointed sole representatives of Les Fils de Peugeot Freres, of Valentigney, manufacturers of all sizes of automobile chains, and that they intend to hold a large stock of these chains in future at No. 1, Albany Street, N.W.

THE STAR ENGINEERING COMPANY are early in the field with particulars of their 1904 models. These will consist of a single-cylinder 6-h.p. two-seated car (not yet on the market), a two-cylinder 9-h.p. vehicle, and three four-cylinder cars of respectively 12-h.p., 18-h.p., and 24-h.p.

AS we recently announced, the business hitherto carried on by Mr. J. E. Hutton has been converted into a limited liability company. An extensive establishment has been opened at 81 and 83, Shaftesbury Avenue, W., the building being a fireproof structure of five storeys, having a handsome facade of stone, ornamented with glazed green bricks. The basement is provided with an inspection pit, washing space for two cars, steam heating apparatus, petrol store for sixty gallons of petrol, etc., and is connected with the ground and first floors by means of an electric lift, sufficiently large to accommodate the biggest car. Vehicles can be driven directly on to the lift and taken down to the basement to be washed.

HERE AND THERE.

THE Queen of Italy has lately acquired a Krieger electrical brougham.

A PROPOSAL is afoot to link up Kingsclere and Newbury by motor-car.

A MOTOR-BUS is now plying for hire at Shipston-on-Stour, Worcestershire.

THE Lincolnshire Automobile Club will hold a run to Sutton-on-Sea to-day (Saturday).

CASES in which motorists have been fined for driving without lights have been reported from Slough, Selby, and Chertsey.

TO-DAY (Saturday) the Western Section of the Scottish Automobile Club will hold a run to Aberfoyle.

THE Russian postal authorities are reported to be negotiating for the supply of a number of motor-cars to be used in the postal service.

By a majority of two votes, the main roads and bridges committee of the Carmarthenshire County Council have decided not to provide a motor-car for their county surveyor.

THE Government of West Australia is reported to be about to inaugurate some experiments with motor-vehicles for the carriage of produce in agricultural districts not touched by the railways.

MOTORISTS in North-East London will be glad to learn that arrangements have been made at the Borough of Hackney electric light station at Millfields Road, Clapton, for re-charging ignition accumulators.

MESSRS. S. BOWLEY AND SON have made arrangements with Verinder's Stores, Anerley, S.E., to have a supply of their motor spirit in the Crystal Palace grounds for those taking part in the reliability trials.

THE Thompson Motor-Car Works, of Armadale, Melbourne, Victoria, will be glad to receive price lists from all English makers of petrol, steam, and electric motor vehicles, both for pleasure and other purposes.

MESSRS. DALE AND CO. have asked the Marlborough Town Council for a license to store about 550 gallons of petrol during the progress of the military manoeuvres. It was stated that every care would be taken to ensure the safety of the petrol, and the license was granted.

MR. PERCY OWEN, who was one of the American team in the Gordon Bennett race, is credited with the statement that he will do no more racing, the Winton Company having decided that in future its officials and agents shall abstain from racing and attend strictly to business.

THE Association de la Presse Technique, of Brussels, have published the August issue of the "Index of the Technical Press." In this useful pamphlet are carefully indexed all the principal articles appearing in the recent issues of the technical magazines and papers, including those in the *Motor-Car Journal*.

ON the occasion of the Automobile Club's Trials, from September 14th to 26th inclusive, motor-cars not taking part in the trials will be admitted at the Rockhills entrance of the Crystal Palace on payment of half-a-crown per car; this will include free garage accommodation inside the grounds during the morning only.

IN view of the requirements of the new Motor-Car Act, which emphasize the importance of competent and judicious driving and observance of the law, and indirectly the amenities of the road, Messrs. Ewart-Hall, Limited, the agents for the C.G.V. cars, have decided to establish a department for giving lessons in driving and technical instruction to intending owners of cars and to applicants for employment as drivers. Certificates according to merit will be issued to the latter, and a register of drivers will be kept.

AN ingenious nail detector for use on motor-cars, to detect nails and avoid punctures, has just been introduced by Mr. H. N. Hickley, electrical engineer, Taunton. As will be seen from the illustrations given herewith, the device consists of a main casting A, which is screwed to a bracket fixed to the frame of the car, the detector being placed on the horizontal centre line passing through the wheels. Inside this casting is an electrically insulated terminal, shown in dotted lines, to which an insulated wire is taken from the cells or magneto. D is a thimble fitting into the main casting, containing a spiral spring, acting on the plunger P, which is suspended, or detained by the wire W, fastened to

Fig. 1.—Showing Method of Wiring.

the adjustable bracket B. S S are two switches, one for disconnecting the nail detector if desired, the other the ordinary switch in the electrical circuit of any car. E E represents the return circuit through the frame of the car; some vehicles are wired in such a way as to avoid this earth return, but this does not prevent the use of the detector. C and C' are the induction coils, one or more, and the commutator found on most cars. S' are the storage cells or magneto. F is an ordinary electrical fuse of about five amp. capacity. The

Fig. 2.—Showing Method of Attachment.

action of the nail detector is as follows:—On a nail being picked up by the tyre, the wire W, which is held half-an-inch off the wheel, is broken, releasing the plunger P, which, by the action of the spring, comes in contact with the terminal holding the insulated wire from the cells; plunger P being in contact with the casting and frame of the vehicle, earths the insulated wire, thus short-circuiting the cells; fuse F is immediately blown, and the car brought to a standstill owing to the current being cut off. The same action may also be arranged to give other warning, such as ringing an electric bell. The work of replacing the broken wire and fuse can be done in a few minutes. Mr. Hick-

ley informs us that experience has shown that a 25 gauge brass wire, while being broken by a nail $\frac{1}{4}$ inch in the tyre, has not been broken by mud or dust after continual use on a car, fitted with Collier tyres, weighing about 15 cwt. and speeded to about thirty-five miles an hour. There being nothing to wear out, the detector is practically everlasting; it can be fitted to any car, and to the front wheels as well as the rear; it is practically weather-proof, and will save a puncture in any heavy tyre, as the use of the detector has shown that nails do not get through the tyres until the car has run a considerable distance after they have been picked up.

A USEFUL roadside combination tool has recently been introduced by Messrs. W. Glover and Sons, Ltd., Warwick. It consists essentially of a yoke casting, to which are hinged two long jaws, and a large screw bored hollow to receive a central spindle with a ball-thrust bearing in the screw. In its ordinary form, it constitutes a lifting jack capable of raising two tons, but by turning up the feet and putting the screw at right angles to its

Arranged as a Jack.

Arranged as Drill.

Arranged as Vice.

former position, it becomes a hand vice, which can be clamped to a gate or any other convenient object by the roadside. Then by another small manipulation it can be used as a hand vice and drill for drilling holes up to half inch in diameter. A considerable range of emergency work appears to be provided for by this clever contrivance, which takes up no more room than an ordinary jack.

In connection with the Reliability Trials of the A.C.G.B.I. an inaugural luncheon will be held at the Crystal Palace on Thursday next, the 17th inst. No seats can be reserved after Monday next, and all orders for tickets (5s. each) should be sent to the Hon. Press Secretary at the Club.

ON Friday of last week we went for a trial spin on a new petrol car of American design which is being introduced into this country by the Challenge Engineering Company. The feature of the vehicle is that the power is supplied by a double-cylinder engine of the two-cycle type, in which inlet and exhaust valves of the usual form are entirely dispensed with. We hope to refer to the new car at greater length in a subsequent issue.

A USEFUL tool designed to facilitate the removal and replacing of exhaust valve springs of petrol engines on motor-cars has recently been put on the market by Mr. A. W. Berry, of Colchester. It comprises a lever used in connection with a piece of cycle chain with hook attached to one end. The hook is connected to any convenient stud, bolt, or projection on the engine above the exhaust valve spring, and the lever is passed through the link of chain which comes $\frac{1}{2}$ in. or 1 in. above the plane of the spring cup, which forms the fulcrum for the lever. By pressing the latter with one hand the spring is easily compressed and the cotter extracted by the other hand. The same method is applied to replace the spring and cotter. A screw-driver or pin wrench is formed on one end of the lever, which can be used for grinding in valves, or as a pin wrench for box spanners etc.

OUR French contemporary, *La Locomotion*, has changed its title to *La Vie Automobile*.

BOTH the candidates for the Wisbech Division of Cambridge-shire own motor-cars.

MR. BALFOUR motored to North Berwick from Whittinghame on Monday afternoon.

THE Mercedes is the name of an English company with an address in Victoria Street, Westminster.

THE Duke and Duchess of Devonshire have left Bolton Abbey for a motor-car tour in Scotland.

MESSRS. J. AND J. GRAHAM, Castle Street, Sligo, are stocking petrol, and supplying accessories for motorists.

LORD PLUNKETT, the Secretary to the Lord Lieutenant of Ireland, has just received delivery of a 10-h.p. car of Lanchester make.

THE Folkestone Motors, Limited, are arranging occasional excursions by motor vehicles to Dover and other places in their locality.

IT is reported that the Adler Fahrrad Gesellschaft, of Frankfort-am-Main, is building a 90-h.p. car for the 1904 Gordon Bennett race.

THE Ryper Motor and Engineering Company, Limited, has been registered with a capital of £5,000, and with offices at 183, Spring Hill, Birmingham.

ARRANGEMENTS have been made with a well-known firm of engineers at Slough for the manufacture of four hundred Mors chassis to be delivered during 1904.

WE are officially informed that the trials in connection with the competition for tractors for military purposes will commence on the 22nd prox., at Aldershot.

MR. W. G. PURSER, who has done so much to improve the roads in West Sussex, has just been appointed engineer for roads and bridges to the Lincolnshire County Council.

FROM the Automobile Club of America we have received a copy of the report and awards of the contest committee with regard to the Commercial Vehicle Contest held in May last. The book is well got up and contains illustrated descriptions of the vehicles which took part in the trials.

WE have often mentioned that among the most enthusiastic of motorists are to be found those who have long maintained a large stud of horses. We are reminded of this by seeing in the "Road" a full page illustration showing that pioneer of the automobile movement, Sir David Salomons, driving his four-in-hand.

IN Princes Road, near the Holland Park Station on the Central London Railway, the Holland Park Motor Company has a showroom for motor-cars, and are making a feature of the 8 and the 12-h.p. Prosper Lambert cars. They have some good agencies, and have lately added a motorists' tailoring department to their business.

MESSRS. E. T. FETCH and M. C. Krarup have just succeeded in making the journey from San Francisco to New York in a 12-h.p. single-cylinder Packard petrol car. The journey occupied no less than 61 days, and the experiences of the two hardy motorists would fill many pages of the *Journal* in the telling. A remarkable feature of the long ride was that the car arrived in New York with one of the original Diamond tyres that were put on at the start.

MR. WARD, representing the Great Southern and Western Railway Co. of Ireland, recently visited Glin with reference to a suggested motor-car service from Foynes to Newtownsandes via Glin and Tarbert. He said that his company were disposed to institute a motor goods service in the district provided they were assured of the support of the business people, and they were prepared to put it into immediate operation, a motor-car being actually ready for the purpose.

MOTOR-CYCLING NEWS.

HEREWITH we give an illustration of the motor-bicycle recently introduced by the Raleigh Cycle Company, Limited, of Nottingham. By an ingenious modification of the cross frame a 2-h.p. motor is placed vertically in front of the bracket, to which it is bolted in four places. The motor is entirely controlled from the handle-bar, the operating mechanism being very simple: an ordinary hook lever on the left breaks the electrical contact and raises the exhaust valve; another hook lever on the right actuates the front rim brake. The two handles revolve, the left opening and shutting the throttle valve, and the right advancing or retarding the spark. A quadrant is fitted on top of the tank for setting the air supply to the carburettor: the correct position of this once found needs practically no alteration, as the hot jacket of the carburettor effectually does away with the variation usually caused by the state of the atmosphere. A plunger rod is fitted to the front of the tank on the left hand side, for lubricating the engine. On pushing this rod down a charge of oil is delivered to the engine; when pulled up the hollow cock receives a new charge from the glass lubricator, which is not delivered to the engine unless the plunger rod is pushed down again. The method of transmission is on somewhat novel lines. A chain connects the engine with a countershaft on the bottom

racket. On the inner side of the large chain wheel on the bracket spindle is a second chain wheel, and from this the drive is carried by a second chain to a large chain wheel attached to the rear wheel instead of by belt, as shown in the illustration, giving a very efficient drive. On the left-hand side is the ordinary chain and pedal drive for starting purposes. The tank holds one and a half gallons of petrol, sufficient for about 150 miles, and contains the accumulator and coil, also a spare lubricating oil tin.

FORTY-THREE entries have so far been received for the "Criterium du Quart de Litre" trial, which the "Auto" will hold on the Parc des Princes track in Paris from the 14th to the 20th inst.

THE Lincoln Wheelers' Sports, on Wednesday of last week, included a two miles motor-cycle handicap for the "Lincolnshire Motor-Cycle Club" Challenge Cup, held by H. W. Stones. The first heat resulted: 1, H. E. Wilson, Lincoln, 500 yards; 2, J. T. White, Scunthorpe, 350. Stones started badly, and retired after a few laps. Time, 4 minutes 18 1/5 seconds. Second Round: 1, A. Hornsby, Scunthorpe, 400; 2, B. C. Holmes, Dowby, 200; J. Evans, Lincoln, fell, and C. Wallis, Lincoln, had his belt off. A good race. Time, 4 minutes 37 seconds. Final: 1, Wilson; 2, Hornsby; 3, B. C. Holmes. Wilson, who rode a Quadrant machine, had broken his exhaust valve just before five o'clock, and a new one was turned for him out of the solid steel and ground in within the hour, and he went to the track and won easily. Hornsby and Holmes both rode well. Time 4 minutes 10 seconds.

A BERLIN firm has lately brought out a voltmeter specially designed for motor-cyclists' use. As will be seen from the accompanying illustration, the instrument is arranged to be fixed on

the handle bar or to the frame of the machine; it is permanently connected up to the accumulator, so that by simply pressing the spring and completing the circuit the rider can ascertain the condition of his battery at any time without having to dismount.

TO-DAY (Saturday) two events are to be run off in the Godstone district by the Motor-Cycling Club. The first is a fifty miles "non-stop" trial for motor-bicycles. The distance is to be ridden at a regulated pace in the presence of a riding committee of inspection, the pace to be such that the distance shall be completed in not less than three hours, nor more than four hours and a quarter. The second contest is a hundred miles "Bicycle and Passenger" trial. The idea of the trial is that it shall be for tandem motor-bicycles, or motor-bicycles carrying two passengers by means of a separate attachment, such as a fore-carriage, sidecar, or trailer. The distance to be traversed is to be one hundred miles, to be ridden in two sections of fifty miles each, an interval of one hour being arranged for at the end of the first fifty miles. The passenger must be a lady, and the total aggregate weight of the driver and his passenger must not be less than 18 stone (252 lbs.). No adjustments will be allowed during the run, but

The Ormonde Motor Tandem Bicycle.

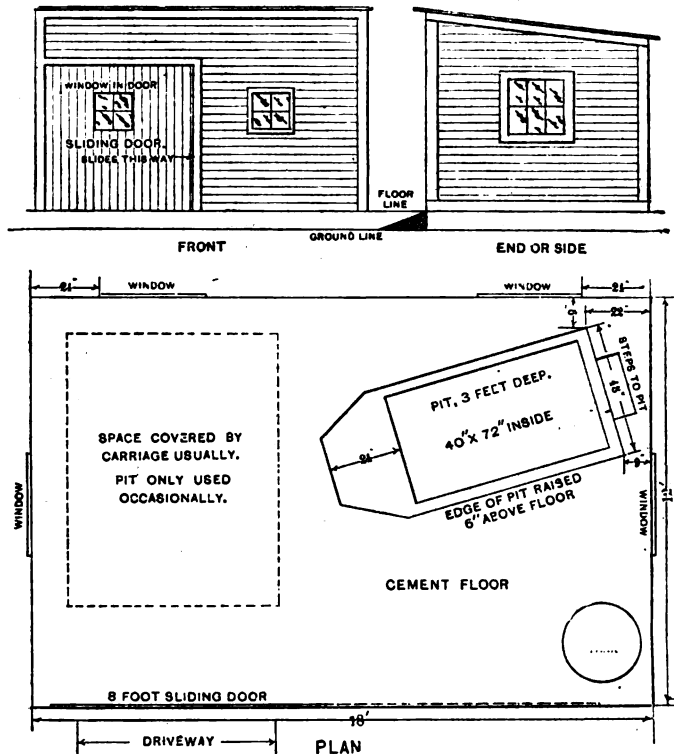

the tanks may be refilled with petrol during the official interval at the end of the first fifty miles, providing the petrol has been carried by the competitor during the run. Competitors will be started at 11 o'clock in small batches, according to the number of entrants.

CORRESPONDENCE.

PRIVATE MOTOR-CAR STABLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read the article on this subject in your last issue with interest, and have pleasure in sending drawings of the stable I have erected. The space at disposal measured about 12 ft. by 18 ft. The plan view shows the general arrangement, and it will be noted that the door is on the side, and slides to the right. The windows in the door and in the stable are arranged so as to come together when the door is open, in order to admit light in either position. The dotted lines show where the car stands generally. I have allowed 6 ft. by 9 ft., room enough for a

large car, and also space to get around it to clean, oil, and repair. The floor is made of cement, and raised about a foot. The pit is on an angle in the corner, with steps down from the back end. It is 40 in. by 72 in. inside, has raised sides to prevent running the wheels in the pit, and pointed front end to aid in getting the car in position. The idea of the angle is that the carriage can be backed on from the door, and can be run straight out without trouble. The petrol tank is in the corner, as shown. Having a separate pit gives one the opportunity of housing a friend's car when he comes to spend the night.—Yours truly,

WINDLESHAM.

CONSISTENCY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I regret to see that a member of the committee of the A.C.G.B.I. has been fined for driving above the legal speed. What is the use of our spokesmen in Parliament and our advocates in the Press extolling our virtues if the official leaders of the movement are so unwary as to become victims to police watchfulness? Really people ought to be more careful and recognise the necessity of respecting public opinion—especially in view of the power about to be exercised by the Local Government Board. Only the other day I saw a criticism in a morning contemporary of a motoring editor who deplored the practice of high speeds, while in the same issue of his journal was an account of a run in which his representative greatly exceeded the legal limit. Such inconsistency is not conducive to good feeling on the part of the public.—Yours truly,

T. C. H.

COST OF REPLACEMENT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have had a little 5-h.p. car for some time past, out of which I have derived no inconsiderable amount of pleasure. The vehicle is undoubtedly well constructed and is one which, up to a week ago, I should have had no hesitation in recommending to my friends. The reason of this sudden change is this: All cars at times need certain parts replaced, due to wear and other causes, and I have discovered that those for my machine can only be obtained at what I consider most exorbitant charges. For instance, I received an invoice for over a sovereign for a

little pinion which at the outside could not have cost more than 3s. 6d., while for other parts I have been asked prices equally excessive. I have heard it said that in some cases it is not the profit out of the sale of the car that the agents rely upon but upon the subsequent repairs. In the case of my car few repairs have been necessary, consequently it would appear that when it is necessary to replace certain parts one has to pay a price which includes a margin to make up the missing repair bill. This system does not appear to be one which is likely to cause motorists to recommend their particular type of car to their friends, and so be conducive to business.—Yours truly,

SPARK GAP.

MOTORING IN BELGIUM.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—There is no doubt that the regulation issued by the Burgomaster of Brussels limiting the speed of motor-cars to five kilometres per hour in certain parts of the city is having a detrimental effect on the movement. During the course of a recent visit to the Belgian capital I was surprised at the relatively small number of cars to be seen and the antiquity of those in use, consisting largely of early Panhards and Peugeots. Whether the new regulations have frightened motorists away or not, the fact remains that during three days I only saw two modern-type automobiles in Brussels. On the other hand, motor-cycles are to be seen buzzing along on all the principal thoroughfares. By the way, it may interest you to know that the local authorities at Ostend have gone even a step further than Brussels by closing certain thoroughfares entirely to motor-cars and motor-cycles.—Yours truly,

C. G. W.

LOOK TO THE VALVES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have recently had an experience with a Baby Peugeot which, I think, will probably be of service to some of your readers, and may save much trouble and expense. The trouble took the form of a terrific grating and pounding noise which seemed to proceed from the gear box or differential. The vibration became unbearable. Hitherto the car had travelled with unusual smoothness. I engaged a good mechanic from one of the best motor works in the Midlands, and after careful inspection he agreed with me that the trouble was in the gear-box bearings, so this was accordingly taken to pieces, only to find that everything was in perfect order. When replaced the car was again tried, but the trouble was still there. My man was therefore now convinced that the axle bearings were at fault. Again this part of the machine received attention (all the differential being taken apart); this also proved to be in perfect condition. Could it be the clutch? Well, this was taken out and found all right. We gave it up, and I had made up my mind to take the car to a first-class garage, when one day, more from fad than anything else, I put in a spare inlet valve and spring. When the car was started I was delighted and astonished to find the trouble gone, and she ran like a clock. Cause of the trouble a weak inlet spring. I should very much like to know how a too weak inlet could cause all this. Can any of your readers tell me?—Yours truly,

A REGULAR SUBSCRIBER.

M. P. writes:—What is the best make of speed indicator for a 10-h.p. motor? I want one with a dial which will show me, as driver, what speed I am travelling at.

The Up-to-Date Nursemaid.
(Das Schnauferl, Munich.)

ALLEGED FRAUD.

AT Bow Street (London) Police Court, Charles Francois, Sinclair Road, Kensington, was charged before Mr. Marsham with fraud. Mr. Harry Wilson prosecuted; Mr. Searle defended. Mr. Wilson stated that on the previous Friday the prisoner went to Mr. O. C. Selbach, of Great Russell Street, W.C., and said he wished to purchase a motor-car. He looked at some, and after a trial purchased a Regal car, the price of which was £180. He presented a card bearing the words, "His Grace the Duke Charles J. Francois de Nevers," and said that his father, who was in Paris, was Prince Oscar de Nevers. He handed Mr. Selbach a cheque for £180 on the Newry branch of the Northern Banking Company (Limited). Mr. Wilson added that after calling one or two witnesses he would ask for a remand. The vehicle had not been recovered, but the police knew where it was. Mr. Selbach, the prosecutor, gave evidence in support of this statement. The prisoner was remanded. At the adjourned hearing the prisoner was again remanded, but the magistrate, Mr. Marsham said the prosecution had better consider the advisability of going on with the case after the statement of a witness that he was told not to leave the car until prisoner's cheque had been cleared.

A DRIVER'S CLAIM.

IN the City of London Court, Judge Rentoul, K.C., has decided a case in which Mr. Hicklin, a motor-car driver, claimed against Mr. Tynney Smith, of 17, Old Broad Street, E.C., for wages and money due in default of notice. Mr. Smith said he engaged the plaintiff as a thoroughly competent motor-car driver, but, as a matter of fact, he was reckless, and knew nothing about putting things right—a most important part of motoring. The plaintiff alleged that defendant wanted

bridge members, who is a magistrate, thought discretion the better part of valour and returned home. A start was at length made after Mr. Hall had cleared the way on his Darracq. After the cars had competed, tea was taken at the Ball Hotel, Wrotham, and following tea, members repaired to Trotterscliffe Hill, but only three cared to try their cars on the very stiff gradient. An Excelsior and a Jehu motor-bicycle, and a De Dion tricycle also ascended Vigo Hill successfully.

The length of the hill was half a mile, the steepest gradient being 1 in 9. The official results were as follows:—

	H.P. of Car.	Weight in Cwt.	No. of Pass.	Min.	Sec.	Speed (Miles per Hour).
Hall, H. O.	24 (Darracq)	19	4	1	11	25.3
Lucas, R.	12 (Lucas)	12	2	1	40	18.0
Edwards, W. T.	14 (Renault)	16	4	1	53	15.9
Packham, E.	5 (Baby Peugeot)	7	2	2	18	13.6
Cornell, A.	5	7	2	2	38	11.4
Hearne, A. B.	9½ (Clement)	12	4	2	56	10.2
Morgan, C. J.	7 (New Orleans)	11	4	3	10	9.4
Spencer, S. L.	10 (Gladiator)	14	4	3	13	9.3
Morgan, C. J.	12 (Brooke)	19	4	3	16	9.2
Bull, F. C.	8 (Peugeot)	16	4	3	47	7.9
*Hallows, F. S.	12 (Belsize)	17	4	4	0	7.5

* Two stops through missing gear.

Up Trotterscliffe Hill, 1,700 feet long, with the steepest gradient 1 in 5.2, the following results were recorded:—

	H.P. of Car.	Pass.	Time Min. Sec.	Speed (Miles per Hour).
R. Lucas	12 (Lucas) ...	2	1 42	11.4
H. O. Hall	24 (Darracq) ...	4	1 50	10.6
F. S. Hallows	12 (Belsize) ...	5	3 10	7.2

Chassis of Dennis 16-20-h.p. car. (See last issue.)

a terrific speed. He took him to Guildford from London in an hour and a quarter, and was timed forty miles an hour coming from Clacton-on-Sea. His Honour said there might be truth in all that had been said, and there might not. A compromise of £2 to be paid by defendant would, he thought, settle the matter.

CLUB NEWS.

YORKSHIRE.

DESPITE the wet morning a fair number of members of the Yorkshire Club kept their promise to visit Mr. A. F. Burton at Turnham Hall, near Selby, on Saturday last, and were rewarded with a very pleasant afternoon, the weather turning out fine. The roads, except where sheltered by the trees, dried quickly. Turnham Hall is a pleasantly situated old house on the bank of the river about two miles below Selby, and Mr. Burton kindly showed the party round his gardens and hothouses. A start was made for home about 6 p.m. The police on the road were not in any way officious, and the general opinion in this part of the county is that if drivers will exercise care at the cross roads and in towns and villages, the police do not make themselves obnoxious. There were present Mr. and Mrs. W. Jackson, Mr. Milnes, Mr. Atkinson and Miss Atkinson, Mr. and Mrs. Rowland Winn, Mr. C. Parker, Mr. Sykes, and Messrs. A. W. Dougill and E. Dougill.

KENT.

Excellent weather prevailed at the hill-climbing trial of the Kentish Automobile Club on the 28th ult. The surface of the road up Vigo Hill, between Wrotham and Gravesend, was in good condition, but a strong force of police occasioned great perturbation, and one of the Ton-

MIDLAND.

To-day (Saturday) a hill-climbing handicap is being held at Sun-rising Hill, Kineton, Warwickshire, by the Midland Automobile Club. The weighing-in will take place at Stratford-on-Avon, commencing at 11 a.m., and the first car will ascend the hill at 12 noon. A dinner will be held after the competition at the Shakespeare Hotel, Stratford-on-Avon.

ON THE WRONG SIDE.

GEORGE KIDDLE, of Dersingham, was summoned at the Docking (Norfolk) Petty Sessions for driving a cart on the wrong side of the highway at Heacham. The Rev. F. F. Taylor said that on the 19th August he was driving a motor-car, and when by the bend in the road opposite Heacham Hall he met defendant driving a horse and cart on the wrong side of the road. In attempting to avoid a collision he ran his motor-car up the bank by the side of the road, and it turned over. The three persons who were in the car were thrown out, but not injured. His car was damaged. Defendant drove off when the car was upset. Mr. Wilkin, for the defence, said defendant was the landlord of the White Horse Inn at Dersingham, and had recently recovered from a severe illness. On the day in question, he overtook a brewer's hooded dray drawn by three horses, and while passing it at a bend in the road he saw a motor-car in front of him, and the accident happened immediately. Defendant gave evidence in support of Mr. Wilkin's statement, and in cross-examination said he was upset at the time, and gave a wrong name and address.—The case was dismissed.

AT Kingston-on-Thames, on the 4th, Alban Gentili, a French driver, of 532, Oxford Street, W., was summoned for driving a motor-car at an excessive speed on the Portsmouth road, Surbiton. Defendant had just been liberated after serving a term of three months' imprisonment for furiously driving in Hyde Park. He was engaged by a motor company, and the offence at Surbiton—driving at thirty miles an hour—was committed three days before he was charged for the Hyde Park offence. The chairman of the magistrates thought that defendant had been sufficiently punished, and discharged him with a caution.

THE Bishop of St. Asaph on Monday told the Rhyl magistrates that he was driving between St. George and St. Asaph with a pair of horses, when he met Mr. Buckley, of Rycroft Hall, near Manchester, going at the rate of nearly fifty miles an hour. He held up both hands, but the defendant made no attempt to reduce his speed. Defendant did not appear, but a limited to a police superintendent who served him with the summons at the Grand Hotel, Llandudno, that he was exceeding the limit. A fine of £10 and costs was inflicted.

WALTER HEWSON, who recently stayed as a visitor at Priory Mansions, Bournemouth, was summoned at Christchurch for alleged furious driving of a motor-car. Mr. J. Druiett, the magistrates' clerk, said the defendant had written a letter to the bench. In this the defendant said his occupation in France having compelled him to return to Paris, his usual residence, before the date on which the case was down for hearing, he was prevented from personally presenting his defence to an "over-zealous charge." As an old driver he held the different French certificates of ability. Defendant expressed his willingness to pay a nominal fine, but said if the bench intended taking a serious view of a ridiculous charge he must ask that the summons might be adjourned so that he could appear and defend himself.—Fined £5, including costs.

DR. J. H. CHALDECOTT, of London, has been summoned for a similar offence, but did not appear, and the magistrates' clerk read a letter from his solicitors in which they stated that their client had not been in Bournemouth or the neighbourhood for 20 years, and that he had never driven a motor-car and never owned one. The only explanation they could offer was that the driver of the car which was stopped by the police gave their client's name instead of his own. The clerk added that he had replied to the letter stating that the communication from the solicitors should be laid before the bench. Supt. Payne said he wrote to the defendant informing him that he should ask the bench to adjourn the case. The bench adjourned the case until Sept. 28th.

POLICE TRAPS.

THERE is a police trap at Holnicote, half-way between Minehead and Porlock.

THE trap at Iford, near Bournemouth, has been the cause of many captures of late.

THE SPEED OF MOTOR-CYCLES.

AT Aylesbury Petty Sessions, William Browning was recently charged with driving a motor-bicycle at a greater speed than twelve miles an hour at Aylesbury. Police-sergeant Shore stated that defendant covered a measured quarter of a mile in 46 1-5 seconds, which was at the rate of between nineteen and twenty miles an hour. There was a fore-carriage attached to the bicycle. The bench convicted the defendant, but only fined him 15s. including costs.

MR. CHARLES WILSON, 22, Arthur Road, Holloway, summoned at Bishops Stortford for driving a motor-cycle with a trailer attached on the same road at more than six miles an hour, swore that the policeman at the Bishops Stortford end stopped him in mistake for another person, as he was detained for an hour on the road between the two points with a breakdown. His companion in the trailer corroborated his statement, and the case was dismissed.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

VOL. V.]

LONDON, SATURDAY, SEPTEMBER 19, 1903.

[No. 237.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

WE have now entered upon the great automobile Trials of the year, and Mr. Basil H. Joy is to be congratulated on the way in which the preliminary stages have been carried through. Experience is a certain guide, and not only has he and the Committee had the advantage of previous Trials but they have, where it has seemed necessary, discarded tradition for present convenience. Much of the success of the Trials, from a popular point of view, depends on the weather, and with that in a more settled mood than has been the case these last few weeks, the success of the tests should be assured.

A Club for Surrey.

SURREY, which has been regarded as officially opposed to automobilism, has now an automobile club, with headquarters at the White Hart Hotel, Reigate. This will be known as the East Surrey Automobile Club, and Mr. David J. Barry, the Hon. Secretary and Treasurer, of High Street, Reigate, will be pleased to receive the names of gentlemen in the district interested in the movement, and likely to associate themselves with the new club. In view of the importance of rightly influencing public opinion during the next two or three years, we trust the new association will be strongly and loyally supported by Surrey motorists.

A Prize in 1931.

A LETTER has been addressed by Sir Frederick Bramwell to the President of the British Association enclosing a cheque for £50, which is to be invested in 2½ per cent. cumulative Consols and to be accumulated until 1931. The amount, about £100, which will then be standing to the credit of the account is to be paid as an honorarium to a gentleman to be selected by the Council to prepare a paper dealing with the whole question of prime movers in 1931, and especially with the then relation between steam engines and internal combustion engines.

Motor-Car Imports and Exports.

THE imports of foreign automobiles into this country continue on a very large scale, no less than 612 cars and cycles being imported last month, the value of the same being returned at £159,202. The value of the "parts thereof" is given as £37,162, so that we get a combined total for August of £196,364, as compared with £235,947 in July last, and £141,883 (representing 474 cars) in August, 1902. Some of the imports were of only a temporary character, being re-shipped to foreign destinations. Thus last month the re-shipments comprised 31 vehicles, amounting in value to £14,067. For the first eight months of the year, the net import of motor-cars, cycles, and parts stand at no less than £1,402,326 (representing roundly 4,600 vehicles), practically double those during the same period of 1902. As regards the exports of automobiles of home manu-

facture, the shipments during the past month were the largest so far recorded, amounting to 111 vehicles, of a value of £31,212. Of parts the exports attained a value of £3,859, making a combined total for August of £35,071, as compared with £33,142 in July last, and £21,577 (representing thirty-seven vehicles) in August, 1902. To the end of August 502 vehicles of British manufacture had been exported this year, these, together with the "parts," representing a sum of £201,102.

Street Traffic.

AUTOMOBILISM has proved a large factor in the proceedings of the engineering section of the British Association at Southport, and the fact that the leaders of this department of science are studying such matter of fact problems as street traffic is encouraging to all interested in the motor-car industry. For the advance of our movement will be practically contemporaneous with the improvement in the construction of roads and the better regulation of traffic by our local authorities. The speedy automobile that seeks to take its passengers quickly along the streets is now restricted to the snail-like progress of the most lumbering market wagon that, in turn, is slackened in speed by the dilatory vans that linger along the edges of the roadways in cities. Hence the importance of the paper read by Lieut.-Col. Crompton.

The Three Types.

As might have been expected, Mr. Clarkson's paper at the British Association meeting was mainly concerned with the steam propelled vehicle, in the development of which he is playing an interesting part at the present time. Latterly the steam and electrical vehicle seem to have been relegated to, an obscure position in view of the undoubted popularity of the petrol motor. But it must not be forgotten that both steam and electricity have a place in automobilism, and that inventors in every country are still doing what they know to introduce the ideal vehicle. Mr. Clarkson's paper contained many useful points, and the fact that he gave with regard to the absence of boiler explosions, although more than four thousand steam cars have been supplied to the public, should reassure those to whom the idea of "sitting on a boiler" is rather alarming.

Royal Motorists.

THE Duke of Connaught is well known as an enthusiast for motoring, and the other day Mr. W. Birkett, whose name will be familiar in Derbyshire in connection with automobilism, drove his Royal Highness from the Curragh to Torboy, a distance of thirty miles, to attend some manoeuvres. The roads were very greasy, but the party got well past Dunlavin without incident. Turning a sharp corner, a flock of sheep was met, only one of which, however, got under the car, and it was able to walk away as though quite heedless of the danger it had survived. After lunch, the return journey was made, and at Dunlavin a sideslip caused the car to run up the side of a bank. The Duke of Connaught jumped out and merrily assisted to get the vehicle on the road again. A few weeks ago, the Prince of Wales saw his vehicle pushed up one of

the Cornish hills, and it will appear that our Royal family are taking to motoring, as they have to other sports, with enthusiasm and thoroughness.

Tar v. Dust.

MR. T. E. WARE, surveyor to the Epsom District Council, has had about eighty yards of road in the Epsom rural district coated with coal tar and pitch to test the practical value of such a means of preventing dust. The tar was laid early in July last, it has been several times flooded with water, and there is a fair amount of traffic over it; but, to all appearance, it is still as good as when first laid down. The road is a flat one, the tar was spread as thinly as possible, and afterwards coated with road sand, and the cost worked out at about 2d. per square yard of surface treated. With an ordinary coat of tar laid on by unskilled labour, a mile of road 20 feet wide would cost less than £100, and in view of the growing use of automobiles, the idea is worth the practical consideration of local councils.

Graphite for Petrol Motor Lubrication.

MR. P. E. LONG, of the John Dixon Crucible Company, has been making some experiments with graphite for the lubrication of petrol motors. He has had three different cars, each of American construction, and in the cylinders of which he claims to have successfully used graphite as a lubricant. He states that it may be introduced into the cylinder by placing a very small quantity in the crank case—not over a teaspoonful to each quart of oil used. When the engine is standing the graphite will settle in the oil, but while in motion, enough of the graphite is stirred up to show its usefulness later on by filling all the pores of the cylinder walls. If a microscope is used on even the smoothest surface turned out by man, it will be discovered that the surfaces are full of microscopical inequalities. The pure flake graphite is said to so fill these irregularities that there is a veneer-like coating of great smoothness and endurance. Mr. Long also states that the use of graphite reduces the amount of oil necessary and that he had no trouble with the ignition.

Col. H. Stratton Bates on his 16-20-h.p. Dennis Car. The Colonel is over 70 years of age and drives the vehicle regularly.

Motor Haulage in Ireland.

MR. THOMAS JONES, of the Jones' Haulage Syndicate, is in Ireland investigating the possibilities of motor haulage there in connection with the Iveagh-Pirrie scheme. His opinion has been obtained about the establishment of a motor traction system between Dublin and Slane and Finglas. Some steps are being taken towards the introduction of a system of carriage which may finally revolutionise the methods of transit

in that country. Irishmen had been gradually falling into the belief that the Iveagh-Pirrie scheme was an economic mirage of a splendid kind, which dazzled them for a while, and was going to fade away like a dream and leave no perceptible traces behind, but it now looks as though business were about to commence.

Queen Marie Christine of Spain and the Infanta Marie Therese in a Panhard Car in Paris.

Motor-cars in Military Operations.

LIEUTENANT GENERAL MILES, who has just retired from active service in the American Army, has addressed a long communication to the U.S. War Department, in which he makes some important and sensational recommendations for the improvement of the army service. He regards the cavalry as obsolete, considering the automobile will take the place of the horse in the next war. For that reason he advises reducing the cavalry branch to the minimum and the building of military roads of strategic importance throughout the country in time of peace. He cites the Spanish-American War as an example showing that the horse is no longer of much practical value in military service and advises that a corps of five regiments be organised for thorough training and constant employment in the use of motor-cycles and automobiles, the corps to be known as a flying corps or a corps of observation. Its duties would be to open the way for the advance of an army, to obtain information, to reconnoitre the country and to repair or build roads and bridges.

Police Activity.

WE recently gave some particulars showing the amount of fines on motorists during the month of August, and a morning contemporary has totalled our weekly chronicle of fines for the past few months, thus familiarising the public with the lucrative occupation in which the police are now engaged when trapping owners of motor-cars. During the last six weeks, Hampshire, Huntingdonshire, and Berkshire have displayed an uncomfortable antipathy towards motorists. In the former county, no fewer than forty-five cases of alleged furious driving have been reported to us, Huntingdon coming second with forty-two. At Windsor, twenty cases have been heard, eighteen at Arundel and Uckfield, nine at Beaconsfield, eight at Newbury, whilst Guildford, which was formerly prominent in this connection, is very low down on the list. Evidently the boycott of Surrey by motorists has had its effect, but it is regrettable that Hampshire should have become so distinguished in the attack on automobilism. It has so frequently been urged that the police of that county are particularly tolerant, that a glance through the recent lists of furious driving cases for the purposes of this Comment has given us somewhat of a surprise.

Garden Cities.

In the development of the Garden City and allotment schemes now being advocated in various parts of the country, the motor-car should be conspicuous. The Small Holdings Association has acquired an estate in Surrey, and hopes to maintain a motor vehicle for the conveyance of produce and goods to and from the station. In this way, not only will the exorbitant cartage terms of the railway companies be saved, but land which has hitherto been somewhat of a drug in the market, owing to inaccessibility, will be given a value for market gardeners and others. This aspect of automobilism is one that should enlist the sympathy of social reformers in its progress.

A Coventry View.

NATURALLY the vicar of St. Michael's, Coventry, the Rev. Canon Atkinson, is interested in the progress of automobilism, and in the current issue of his parish magazine says that if "Coventry will set an example in producing motor-cars at a moderate cost, not for speed, but for ordinary practical

Devonshire, enjoyed the sweetly varied scenery of the Lake District, and crossed the border to bonnie Scotland, calling on old friends and making new ones on the way.

New Sport.

REPORT says that the advice of the gallant knight who recently advised farmers and others to bring motorists to a standstill by shooting at their tyres has been followed by an agriculturist north of the Tweed. Unfortunately, however, no names have been given, or the identification of the valiant shooter and the reported London motoring victim would have been possible. It is said that the farmer and the motorist repeatedly met on the road, and the former, to protect his horses, held up his hand as a signal to the latter, who, however, paid no attention, and drove his car at full speed. His signals having been several times disregarded in this way, the farmer became incensed, and on the next occasion of their meeting he burst the tyres of the motor-car wheels by firing the contents of a rifle into them. Such sport ought to be as exciting as rabbit shooting.

The Start of Madame Lockert on the Tony-Huber Car from Paris for St. Petersburg.]

use, and if the machinery can be so regulated as not to be constantly breaking down, the custom would increase an hundred-fold, and Coventry will gain another such reputation as it won by the Starley improvement in the bicycle. I calculate this is common-sense, and I trust my friends of the motor-car will not become alarmists, but will take a sanguine view of the situation and have an eye to the future of the industry."

Commercials and the Car.

AUTOMOBILISM should be popular among "commercials," enabling them to be independent of the rigid timetables of the railway companies and to economise time and money in many ways. During the past summer many heads of firms and leading commercial men have combined business and pleasure by motoring in pleasant districts, calling on customers on the way. Our bright contemporary "Music" records an instance of such harmony in Mr. Heiden-Heimer, of Messrs. E. Hirsch and Co., the music firm, covering 2,000 miles in three weeks on a 16-h.p. "Martini Simplex." He visited the principal places in

At the Manœuvres.

MOTOR-CARS have played an important part in the military manœuvres on Salisbury Plain. Lord Roberts spent Monday night at Corsham Court, Lord Methuen's residence, and on Sunday proceeded to Marlborough, from which he has directed the manœuvres. The Commander-in-Chief has made extensive use of a motor-car, and these vehicles have also been largely employed by members of the directing and umpire staffs and by the newspaper correspondents. A large number of members of the Motor Volunteer Corps have been on duty, under command of Lieut.-Colonel Mayhew, and the corps has proved of great utility in carrying orders and in conveying officers on duty from place to place. On Monday, the Duke of Connaught made a wide tour of the invaders' position, crossing the heights of Hackpen Hill in his motor-car. Judging by the difficulties which beset the march of the gallant patrols of the 5th Lancers, who were the captors of Swindon on Monday morning, the one thing above all others to stop cavalry is a thoroughly startled herd of milch cows, especially if they have young calves at foot. Even motor-cars, directed by

the most recklessly brave of Motor Volunteers, could not charge the horned mob with success. The correspondent of the "Daily Telegraph" saw a line of the fiercest motors stopped in helpless confusion by a small detachment of two cows and a calf, and a town held by a herd would baffle even General French himself. Infantry and guns and cavalry are no doubt excellent in their limited way, but for real stopping power a bovine brigade is matchless.

Appeals.

A FUND is being formed for the purpose of taking certain selected cases under the new Motor Car Act to superior courts, a course that seems very desirable in view of the unsatisfactory constitution of the usual courts before which motorists are taken. Often the gentlemen constituting the rural bench are found sitting on the county bench, and appeals from one to the other are practically to the same body of men. This makes it very desirable that some such fund as is now being raised should be quickly established to convince the magistrates that their frequently prejudiced decisions are certain to be carried to higher courts.

The Dust Trials.

ON Wednesday a useful series of tests were carried out on the cycle track at the Crystal Palace. A layer of flour was placed over a few yards of the track, and the cars were required to come to a stop on this patch, and run their engines at full speed. Very few stirred up any dust at all, and in no case more than a very slight quantity. The vehicles were then required to make two circuits of the track, some fifty yards of which had been well sprinkled with flour. Travelling at a speed varying from twenty to twenty-five miles per hour, it was clear that very little dust was raised by the suction of the body of the vehicle. The wheels were guilty of stirring up almost the whole of the flour. Those cars, however, having boxes underneath the flooring at the back, sucked the dust after them to a greater extent than those with more clearance from the ground. Photographic observations, with a camera electrically operated by the passage of the cars, were made of the volume of the clouds which may assist in differentiating between the vehicles. Later in the day some trials with regard to the absence of noise and vibration were made in other parts of the Palace grounds.

Speed Trials in Yorkshire.

TO-DAY (Saturday) the Yorkshire Automobile Club will hold a series of speed trials at Wentworth Woodhouse, starting at 2 p.m. The best route from the north is *via* Wakefield and Barnsley, and the entrance is at the Hood Hill Lodge, near the seventh milestone on the Barnsley and Sheffield road. Members from Rotherham or Sheffield may enter the park by any lodge on the east side.

THE postal authorities in Berlin are at present making some trials of motor vans for the conveyance of mails.

A SCHEME of affiliation is being prepared, by which it is hoped that all motor-cycling clubs, both in London and the provinces, will become connected with the Auto-Cycle Club, and so extend the useful work which is being accomplished.

REGARDING our description of the Wantage steam wagon in the last issue, by accident we found ourselves in the breezy Berkshire town one day this week and availed ourselves of an invitation to visit Mr. Taylor, the manager. A steam wagon being under steam, several tests were made, including a trip up a long hill, with gradients, at portions, of one in seven. The experiments were in every way successful, and after they were completed we were conducted through the works, which cover more than an acre. These were found to be replete with the most modern tools, and the workmanship and materials were seen to be of the best description. There is, we are convinced, a future for the Wantage steam wagon.

THE MAN AND THE CAR.

EVERY margin of increase in the speed of the motor-car means so much more responsibility for the driver, along with a certain satisfaction in being able to govern his pace by the desire or by the requirements of the day or the hour. There is constant need of good judgment and vigilant nerve to make anything more than ordinary progress on the highway, even under the most favourable circumstances. And if mishap does come the personal intelligence and mechanical resource of the man at the wheel will often enable a damaged vehicle to finish its trip, or at least to get to a good repairing establishment.

That the "personal equation" is no hollow phrase is amply proved by the fact that large numbers of expert amateur *chauffeurs* are cultivating a larger liking for those automobiles which depend the most upon the knowledge and skill of the operator, and the least upon handling by rule, for their successful use, particularly under speed. A premium is placed not only upon mental and mechanical dexterity, but also upon careful and accurate judgment. Emergencies come on the wings of the invisible wind; and every one must be reckoned with, whether or not it suits the fancy of the moment. An emergency, roughly defined, is a crisis in which a person is called suddenly to do the best he can ever do under like circumstances. These crises come to every automobilist in his maturity as well as in his novitiate—perhaps even more so since he is likely to be less cautious. These are invaluable for discipline and instruction in the education of the *chauffeur*. They furnish the ready means of testing the physical powers, as well as proving the service of the senses. Action in emergency discloses the strength or weakness of one's nerves, shows the mental facilities one has, and not infrequently decides in a flash what might not be discovered under average conditions in a lifetime.

"Presence of mind," as the phrase goes, is a quality well worth cultivation. This readiness of summoning one's strength and judgment for instant use constitutes one of the most marked differences in men. Experience is necessary to enable the automobilist to meet the emergencies of the road successfully. The same conditions may never be present in two different cases, and conduct in one must be studied to use in what is to follow. Rashness in emergency is not bravery, because it lacks the essential element of cool judgment. On the contrary, it is usually a dangerous exercise of strength or courage. That fear of committing a fatal blunder, which makes men who think and care pause for an instant before making the decision, is an ingredient of true bravery. Acting first and thinking afterwards is the fool's method.

It would be interesting, remarks the "Automobile Magazine," to analyze the mental processes by which, very largely, the long-distance racing men contrive to run their huge racing machines at speeds as high as eighty miles an hour in the Continental road races. Suppose that before the oncoming brigade a child or dog squeezes through the wall of spectators and sprawls out upon the highway. To the *chauffeur* in the lead it is a mere speck in the distance—with a large problem attached to it. Will the child or dog attempt to cross the road, or will he return to the side whence he came? The decision as to what it were best to do must be reached, not through deliberation, or by calm consideration, not in minutes or even seconds, but in a flash.

Nor is this faculty wholly dependent upon the driver being an expert mechanic; it is rather the brain and the nerve that is in him. Many of the famous French racing men have been brought up in the workshops, and have therefore a thorough acquaintance with the practical side of their vehicle. But the best amateur management does not materially suffer from point-and-point comparison therewith. The former displays more mechanical dexterity; the latter, usually, more tact and more personal resource. This last is the most important of all, for it comprehends all the rest.

THE RELIABILITY TRIALS.

KENT, Surrey, Sussex, and Hampshire are receiving a great motor-car lesson, and following the trials of last year, the present tests should so far complete the education of those counties that other localities might well be influenced in 1904. With the Crystal Palace as the centre of operations, the Trials organised by the A.C.G.B.I. have become an important feature of the Automobile Year, and their value is recognised by makers and public alike. The arrangements this year are an improvement on those of 1902, and instead of the cars being closely packed in a somewhat inconvenient part of the great glasshouse, they are now stored in tents in the grounds. Entering from the Rockhills entrance, the visitor finds trees and fences placarded with notices: "To the Observers' Tents," "To the Press Tent," "To the Replenishing Depot," "to the Storage Tent," and similar directions to the various conveniences in connection with the Trials.

Of the 140 entries all except ten are vehicles using petroleum spirit. The Roots Oil Motor and Motor-Car, Limited, have entered one of their 4-h.p. cars using ordinary paraffin as fuel.

effected by means of a honeycomb radiator of a registered design, behind which there is a fan driven off the engine shaft by a belt. Coming to the engine itself, the three cylinders are cast separately, and are made of iron. Both inlet and exhaust valves are mechanically operated, and the cams are all on one shaft, and form a part thereof. The three-throw crank shaft is of nickel steel, bearings being placed between each of the cranks, which absolutely prevents any tendency to bend. The engine is governed on the throttle by means of a butterfly valve placed on the induction pipe, while the commutator is of the wipe pattern, and the sparking plugs are fixed vertically in the valve chamber. The bore of the cylinders is 90 mm. and the stroke 115 mm. The crank chamber is, of course, of aluminium, and it will be observed from Fig. 2 that the hanger brackets form a part thereof, and that the inspection plates are of ample size.

The Swift Motor Company have entered a 6-h.p. Swift voiturette; the Garage Proprietary, Limited, a 7-h.p. Cottereau; the Vulcan Motor Company, Limited, a 6½-h.p. Vulcan light car; Mr. L. A. Beckett, a 9-h.p. Mathieu; Messrs. B. Thompson and Co., an 8-h.p. Achilles car which Mr. Thompson drove from Frome to the Palace during the night of Tuesday; the Clyde

Fig 1.—The "Argyll" 12-hp. 3-Cylinder Car. No. 49 in the Reliability Trials.

The nine steam cars include an "Okodyne" by the Bickford Burners Company, a Cremorne by the Cremorne Motor Manufacturing Company, a Relyante by the Chief British Depot, two 12-h.p. Chelmsfords, a Stanley, a 10-h.p. Gardner-Serpollet, and two 10-h.p. Whites, the bulk of these being new cars now making their first appearance in public trials. As we go to press, however, we learn that the Okodyne and Cremorne vehicles will not take part.

Passing now to the petrol cars, the entries of the Hozier Engineering Company may be regarded as unique, they consisting of four vehicles having respectively one, two, three, and four cylinders (9, 10, 12, and 16 h.p.). We illustrate the 12-h.p. three-cylinder Argyll car and its engine, which is of the company's own manufacture. With the exception of the motor, the mechanical parts of the car are the same as those employed during the whole of this season in the single, double, and four-cylinder cars, and which, such as friction clutch, gear-box, and axles, are now well known. The wheel base of the car is 7 ft. 10 in. and the track 4 ft., while the wheels are of equal size, 34 in. diameter. The frame, however, is made of stamped steel in place of the armoured wood hitherto used. The cooling is

Cycle and Motor-Car Company, one of the 6½-h.p. Clyde cars recently illustrated and described in the *Journal*; the International Motor Manufacturing Company, a 10-h.p. Dechamps; the Velox Motor Company, a 20-h.p. Velox; the Maudslay Motor Company, a 25-h.p. Maudslay; Messrs. Evart-Hall, Limited, a 15-h.p. C.G.V. similar to that, as regards the chassis, recently supplied to the King of Portugal; the United Kingdoms Inventions Association, a 20-h.p. four-cylinder Holcar; the Fiat Motor Agency, a 16-h.p. Fiat, an Italian-built vehicle; Messrs. A. Darracq and Co., one each of their 9-h.p., 12-h.p., and 24-h.p. cars; Messrs. Dennis Brothers, Limited, a 12-14 h.p. and a 16-20-h.p. Dennis car; Messrs. F. F. Wellington, Limited, a 14-h.p. Brooke and a 12-h.p. Gobron-Brillié; the Albion Motor-Car Company, Limited, a 12-h.p. Albion car with special governor; the Simms Manufacturing Company, Limited, a 10-h.p. and a 20-h.p. Welbeck; Messrs. Krupkar, Limited, a 12-h.p. Krupkar; Messrs. Horsfall and Bickham, a 10-h.p. Horbick; the Bradford Motor-Car Company, a 10-h.p. and a 20-h.p. Spyker, of which a description was given in the *Journal* at the time of the Exhibition at the Agricultural Hall in April last; the Ariel Motor Company, Limited, a 12-h.p. Ariel;

Messrs. J. W. Brooke and Co., a 14-h.p. Brooke, which was driven up by road from Lowestoft by Mr. Maudslay Brooke; Messrs. Marshall and Co., a 15-h.p. Belsize; the British Automobile Commercial Syndicate, a 12-h.p. Clement; Captain Theo Masui, a 15-h.p. and a 20-h.p. Germain car; Messrs. S. F. Edge, Limited, a 10-h.p. and a 12-h.p. Gladiator; the Speedwell Motor and Engineering Company, Limited, a 9-h.p. Renault;

Fig. 2.—The Argyll 12-h.p. Three-Cylinder Motor.

the Pick Motor Company, a 10-h.p. tonneau and a 10-h.p. voiturette; Mr. O. C. Selbach, a 6-h.p. and an 8-10-h.p. Regal; the Star Engineering Company, one each of their 7, 10, and 15-h.p. Star cars; Messrs. John Marston, Limited, two 12-h.p. Sunbeam cars; the Thornycroft Company, a 10-h.p. and a 20-h.p. car; Messrs. Durham, Churchill and Co., a 10-h.p. and a 20-h.p. Hallamshire vehicle; the Burlington Carriage Company, 6-h.p., 8-10-h.p. and 16-20-h.p. Elswick cars; the Chief British Depot, a 6-h.p. and a 12-14-h.p. Relyante; the Mohawk Motor Company, Limited, a 9-h.p. Mohawk Manon; Messrs. De Dion-Bouton, Limited, a 6-h.p. and a 12-h.p. De Dion; the New Orleans Motor Company, a 12-h.p. and a 15-h.p. New Orleans; Messrs. Jarrott and Letts, Limited, two 5-h.p. Oldsmobiles and 16-h.p. and 24-h.p. De Dietrich; the Beaufort Motor Company, Limited, 9-h.p., 14-h.p. and 20-h.p. Beaufort cars; and the Roadway Autocar Company, a 10-h.p. Renault, a 14-h.p. Renault, and an 18-h.p. Mors.

The Motor Manufacturing Company, Limited, are represented by an 8-h.p. voiturette and a 20-h.p. M.M.C. car. On the latter are several minor improvements which will be appreciated, including the placing of tool boxes on the steps on each side, thus adding greatly to the convenience of ladies mounting the vehicle. Between the bucket seats is also a receptacle for papers, etc. The Daimler Motor Company have a 15-h.p. and three 22-h.p. Daimlers in the Trials, in addition to a 12-h.p. Belgica, which, as the name implies, is of Belgian construction. Mr. E. W. Hart had entered a 24-h.p. combination petrol-electric car, but it was not ready in time to take part. The Brush Engineering Company are represented by two cars, one of 12-h.p. and one of 15-h.p. Messrs. Wilson and Pilcher had entered a 12-h.p. four-cylinder car and a new 18-h.p. six-cylinder vehicle, but unfortunately the latter will not be seen in the Trials. A new Scotch car is the 25-h.p. Cassell of the Central Motor Company. Captain Deasy will be represented by a 16-h.p. Rochet-Schneider car and

a 14-h.p. Martini, the latter being built in Switzerland, under a Rochet-Schneider licence.

The Standard Motor Company has a new car in an 8-h.p. Standard, and the Coronet Motor Company, Limited, a 7-h.p. Coronet. The entries of the Rex Motor Manufacturing Company include a 3½-h.p. Rex Tricar and 10-h.p. and 13-h.p. Rex cars. The Siddeley Motor-Car Company is represented by a 6-h.p. car, and the London Motor Garage Company by two 15-h.p. Pipe vehicles, one of which is fitted with the Jenatzy magnetic clutch. Messrs. James and Browne have a 9-h.p. and an 18-h.p. four-cylinder car in the Trials; the Century Engineering and Motor Company a 6½-h.p. Century tandem, a 6½-h.p. two-seated car, a 10-h.p., a 12-h.p., and also a 16-h.p. vehicle. Messrs. Friswell, Limited, are represented by a 5-h.p. Baby Peugeot, a 10-h.p. and a 12-h.p. car of the same make. The Eagle Engineering and Motor Company, Limited, have sent a 6-h.p. Eagle tandem and a 9-h.p. Eagle car; Messrs. Mann and Overtons, Limited, are represented by a 5½-h.p. Pony Richard, a 10-h.p. Georges Richard, a 12-h.p. car (illustrated in Fig. 3), and a 24-h.p. vehicle. The Anglo-American Motor-Car Company are running a 6½-h.p. Cadillac, which we hope to illustrate next week, and a 20-h.p. Winton; and the Lanchester Engine Company are taking part with a 10-h.p. car and one of the new 16-h.p. Lanchester vehicles.

Messrs. Humber, Limited, had entered five cars for the Trials, these including two examples of the new 5-h.p. Humberette, a 12-h.p. car, a 20-h.p., and a new 9-h.p. three-cylinder vehicle. The latter will, however, not be seen in the Trials, as we learn that whilst it was being taken for a final run on Monday, prior to sending the vehicle to the Crystal Palace, it was damaged to such an extent that its appearance in the Trials is impossible. In order to avoid a collision the driver had to take the side of the road, and run into a hedge, with consequent injury to the vehicle. This was the first and only one of the new type that the company had on hand. Minerva Motors, Limited, have a new car in a 7-h.p. Vesta, another new vehicle being the 16-h.p. Maxim two-cylinder car of the London General Automobile Company. The Ryknield Engine Company, Limited, had entered a new 10-h.p. car, but inform us they have been unable to complete it in time. The Wolseley Company are represented by one of the new 6-h.p. light cars, and examples of the standard 7½-h.p., 10-h.p., 12-h.p., and 24-h.p. types. The Mo-Car Syndicate, who had entered two 12-h.p. Arrol-Johnston cars,

Fig. 3.—The 12-h.p. Georges Richard Car. No. 57 in the Reliability Trials.

met with bad luck, they being too late for admittance at the Crystal Palace by only three minutes. The Weston Motor Syndicate are represented by a 18-h.p. Chenard and Walcker car, in regard to which they ask us to mention that it has, unfortunately, been found impossible to complete it, in the true sense of the term, in time for the Trials; that is to say, the car entered is really only a rough conception of what the actual

finished car will be, a special carburettor adapted to their particular system not being ready. The car which is running in the Trials is in the rough. As an instance, it may be mentioned there was not even time to fit the aluminium dust-guard, which will protect the whole of the machinery from dirt; the control levers and pedal are all hand-made, and the bonnet and chassis were painted in one night. Altogether, about thirty cars failed to appear, and two or three were regarded as duplicates, infringing the rule that only one vehicle of a type may be entered by any firm, so that in all 107 cars out of 140 entries are now eligible for the Trials.

On Tuesday morning the first of the series of brake tests was held; in the Palace grounds, a course about 100 yards in length having been selected for the purpose. The greatest gradient of the road was 1 in 7, and the plan adopted as follows: The vehicles were driven up the ascent to a white line across the road, where they were stopped with the foot brake. After a momentary rest the car had to be allowed to run back until the order to halt was given, when the application of the brake gave

The Trials proper, so far as the Thousand Miles are concerned, begin on Friday the 18th, and the following notes as to the routes will be of interest to motorists anxious to see the vehicles in procession array, or when at their halting places.

Friday, 18th inst.—To Margate via Bromley, Foot's Cray, Wrotham Hill, Maidstone,* Sittingbourne, and Canterbury, to the Cecil Square, Margate. The cars will return by the same route, stopping again at Maidstone.*

Saturday, 19th inst.—To Eastbourne via West Wickham, Sevenoaks, Tunbridge Wells,* Mayfield, Hailsham, to the sea front at Eastbourne. The return will be made via Uckfield, Edenbridge, Westerham, up Westerham Hill.

Monday, 21st.—To Worthing via Epsom, Dorking,* Pulborough, Arundel, to the sea front at Worthing, returning by way of Broadwater, Horsham,* Reigate, and Purley.

Tuesday, 22nd.—To Folkestone via Maidstone and Hythe, to the Hotel Metropole, Folkestone, returning by same route to Maidstone,* and thence via Seal, Riverhead, and Farnborough.

Wednesday, 23rd.—To Southsea via Leatherhead, Guildford,* up Hindhead, Cosham, to the Esplanade, Southsea. Return by same route stopping again at Guildford.*

Thursday, 24th.—To Bexhill via Tonbridge,* Robertsbridge, to the sea

Fig 4.—The 10-h.p. White Steam Car, No. 84 in the Reliability Trials.

the judges an opportunity of seeing if it was sufficient to hold the car. After the hand brakes had been similarly tested the vehicles were started from a standstill below the steepest part of the incline.

The way in which the cars went through the tests would have convinced any nervous J.P. as to the power of control that is now possible. The official results are of course not yet known, but among the English cars conspicuous in these preliminary tests were the 8-h.p. M.M.C., 12-h.p. Albion, 22-h.p. Daimler, 12-h.p. Ariel, 16-h.p. Lanchester, 10-h.p. and 12-h.p. Wolseleys, 15-h.p. Belsize, 18-h.p. James and Browne, 6-h.p. Swift, 12-h.p. Dennis, 4-h.p. Roots, and 5-h.p. Humberette. Other cars succeeding in this category included representatives of the following types: Baby Peugeot, Gladiator, Oldsmobile, Cadillac, Elswick, Regal, Spyker, Gardner-Serpollet, Georges Richard, Peugeot, Rochet-Schneider, etc.

Wednesday's trials comprised a series of observations with regard to the noiselessness or otherwise of cars, and also dust trials. Thursday's proceedings included a luncheon and a meeting of observers to receive final instructions.

front, Bexhill, where a speed trial will take place. The return will be by way of East Hoathley, East Grinstead, Godstone,* and Purley.

Friday, 25th.—To Winchester via Leatherhead, Guildford,* Farnham, Alresford, to the Guildhall Square, Winchester, returning by same route stopping again at Guildford.

Saturday, 26th.—To Brighton via Purley, Redhill, Crawley,* Cuckfield, to the sea front, Brighton, returning by Handcross, and the same route as on the outward journey, with stop at Horley.*

The start each morning will be at 7.30 p.m., and three-quarters of an hour will be spent at the furthest point on the outward journey each day. Compulsory stops of fifteen minutes will also be made at the places indicated above by an asterisk.

DESTINATION.	MILEAGE.	LUNCHEON AT
Margate	150½	White Hart.
Eastbourne	121	Grand.
Worthing	118½	Warne's.
Folkestone	137½	Metropole.

Bexhill	121½	Sackville.
Winchester	133½	St. John's Rooms.
Brighton	91½	Old Ship.

THE Derby police are taking action against reckless drivers of horses.

LAYING THE DUST.

THOSE who visited Ireland and went over the Gordon Bennett course, in the pouring rain, no doubt saw, as the writer did, several patches of black looking stuff, with a surface like greased glass, which rendered steering very "tricky." Again at Ballyshannon many will remember there was a fair sized installation on which, during the rain, one of the competitors slipped, causing the authorities afterwards to apply sand to the surface. These dust layers, we were informed at the time, had been applied with the chemical known as "Westrumite."

Receiving an invitation on Monday from the directors of Westrumite, Limited, to be present at a demonstration of the efficiency of their process for the purpose of laying the dust on high roads, we notified our acceptance. The venue was Windsor, and some thirty gentlemen were accommodated in a saloon carriage. After luncheon at the White Hart, presided over by Mr. Peters, ex-mayor, several highly laudatory speeches were made, including one by Mr. Wethered, who was on one of the cars starting from Whitehall on that memorable day in November, '96.

The party, which had been largely augmented, then proceeded in some half dozen cars and several wagon-

the effect of using it on the roads is that the frequency of ordinary watering is done away with, and the inventor is of opinion that, according to the wear and tear on the roads, it will only be necessary to do the watering once or twice or three times a month, with a very small proportion of solution.

A feature of the demonstration was the willingness of the principals to impart all information to inquiries as desired, and in response to an inquiry from the writer to see the mixing for himself, an adjournment was made to the surveyor's yard, where a water cart was brought out, and a quantity of the solution was poured in. It was seen to mix at once with the water, and the cart went round the spacious yard watering it, the flowing liquid being of an even dark colour. Suggestions were made that the stuff might stain ladies' dresses, etc. The inventor, who was present, immediately took the tail of his light covert coat and dipped it into the stuff, he claiming it would leave no stain whatever. The only smell was a slight odour of ammonia, but, as is well known, this chemical is of a highly volatile character and soon disappears.

The effect of watering on the roads is to make mud. The effect of watering with "Westrumite" is to make the roads hard, as if under frosted conditions, and judging by the experiments we saw on Monday we do not anticipate any fear of the roads being greasy in wet weather. As to the lasting stability of

The North Eastern Railway Company's Motor 'Bus Service between Beverley and Beesford. The Two Stirling 24-h.p. vehicles at Beesford. (See issue September 5th.)

ettes, a mile or two out of the town, where about 1,000 feet of road had been sprinkled with "Westrumite." In the meantime the writer, in conversation with Mr. Adkins, had referred to the experiments in Ireland, and that gentleman informed us that instead of only putting a solution of about five or ten per cent. on the ground, the contractors had practically poured it on without scarcely any water at all, and hence its highly slippery condition. The present patch had been treated on the Sunday morning with thirteen per cent. of the solution and three per cent. on the Monday morning, while the demonstration took place in the afternoon of the latter day. The course was kept clear, and the cars, including a 35-h.p. Panhard, came along from off the dusty roads at full speeds, leaving behind high banks of dust, and reaching the "Westrumite," where the atmosphere was absolutely clear, and not a particle of dust was raised. The experiments were extremely successful, and we feel convinced there is now an article on the market with which surveyors themselves can experiment. The solution, which consists of a small portion of petroleum, ammonia, etc., mixes instantaneously without any stirring when poured into the ordinary watering cart. The proportion suggested of course depends upon the state of the road. The largest quantity advised is 10 per cent., but the usual proportion is 5 per cent. In many instances, however, the quantity can be lower, while

the roads under the new treated conditions, time alone can prove, but it seems to us that the process, if intelligently applied, would give the roads longer life.

At all events the article is now marketed and can be supplied in barrels, at the rate, of £10 per ton, and we are assured that the cost of distributing the mixture is only about one half farthing per square yard per distribution. Surveyors can experiment for themselves, and it is not an expensive outlay for them to order, say a ton, and, in the proportion of 5 per cent., to apply it on any dusty roads in their locality. Of this they may rest assured, while the stuff is on the road there will be no dust. At all events, as motorists, and keenly alive to the nuisance of the dust, we were extremely pleased with the experiments, and it now remains for local authorities to at all events try the solution. We wish Westrumite and any other similar preparation the very best of success.

At Bow Street, on Tuesday, Charles Francois, of Sinclair Road, Kensington, who, it is alleged, represented himself to be the Duke Charles de Nevers, of Paris, was formally remanded for committal to the sessions charged with obtaining a motor-car value £180 from Mr. O. C. Selbach by means of a worthless cheque.

CONTINENTAL NOTES.

DURING the course of his recent visit to Marienbad, King Edward made a number of trips in a 24-h.p. Mercedes, kindly placed at his disposal by Messrs. Arnold Spitz and Company, of Vienna, who have since received the following letter:—

General Sir Stanley Clarke is directed to convey to the firm Arnold Spitz the best thanks of His Majesty King Edward for the excellent automobile so kindly lent by the firm for his use whilst at Marienbad. His Majesty was able to enjoy many charming rides in the neighbourhood, and he thought the car one of the best he had ever driven in. These excursions were rendered all the more pleasant by the skilful way in which Mr. Ernst Eidlitz drove the car.

The illustration herewith shows King Edward leaving the Hotel Wiemar, Marienbad, in the car. His Majesty occupies the right hand seat in the tonneau, being accompanied by General Sir Stanley Clark. Herr Eidlitz is at the wheel, and Capt. Ponsonby is at his side.

Bouton, there is some talk of organising another tour next summer in England and Scotland.

THE hill-climbing trial at Chateau-Thierry is announced for the 4th of October, and it is to be hoped that there will be plenty of entries, and a good meeting; so far, however, there are only about a dozen entries. The race is to be a kilometre, with a standing start, and the course is straight.

MESSRS. W. AUSTIN AND SONS, of Neshells Green, Birmingham, are stocking petrol, oils, and greases, and also re-charging accumulators.

A SERVICE of steam motor-cars is to be established between Pontypridd and Caerphilly, a new departure inaugurated by the Alexandra Company.

VERNO CHURCHILL, who has made a great reputation as a globe trotter, started from Atlantic City, U.S.A., a few days ago on an automobile trip round the world. He will travel

His Majesty King Edward off for a run in a Mercedes at Marienbad.

(Allgemeine Automobil Zeitung.)

THE French Automobile Club's trials of public service vehicles and motor-cabs, which should have commenced on the 5th October, have been postponed for a week.

Le Monde Sportif is organising a series of flying kilometre and mile speed trials to be run over the measured distances on the Dourdan road, forty kilometres from Paris, on October 22nd. Already eighteen entries have been received, including six Darracqs, three Serpollets, two Gobron-Brillies, a Mercedes, a Prunel, and five motor-cycles.

FOLLOWING the example of the Frankfort Automobile Club, the German Club proposes to hold a race meeting on October 18th, on the Trab horse-trotting track at Westend, Berlin. The track is just a mile round.

IN view of the success of the recent tour in Germany of owners of De Dion cars, organised by Messrs. De Dion and

25,000 miles, and expects to be away sixteen months or longer. He is first making for San Francisco, whence he will cross the Pacific Ocean to Japan, travelling through that country, China, India, and Europe, and back again to America. Let us hope that he will be more successful than his predecessors in the round-the-world attempt.

IN view of the stories that have lately been in circulation as to the abuses of cars whilst stored in various garages, an incident reported from the Regent Street garage, a few days ago, is of interest. A customer took a car to be stored there, and after it had been in the garage a couple of days one of the workmen found £80 in bank notes in one of the cushions. The find was at once reported to the manager, and the money returned to the owner of the car, who rewarded the man who found the money with £10. This is only a small point, but motorists leaving cars at garages should always take care that they do not leave small parcels and valuables of any kind with their cars.

THE DEAUVILLE TRIALS.

THE Deauville races took place on Thursday, last week. There were fifty-three entries and twenty-two starters, and in some cases, like in the wayside theatres, the same actor was made to play more than one part. The meet could not by any stretch of imagination be said to be representative of the motor-car manufacture of France. The competition was for the best time over a distance of 500 metres, with a standing start, and with a dead stop with the winning line between the wheels. Tricky starts were avoided by the following ingenious arrange-

the Deauville races; it was the calm before the terrible storm of Thursday night, which devastated the coasts of France and England, swamped the promenade at Deauville, where the race had been held, and left it blocked by sand and debris. The best time was made by Jeandre on a 70-h.p. Mors, who did the distance in 33 4-5 seconds, beating the record held by Duray on a Gobron-Brillié by 1-5 of a second. Two 40-h.p. Darracqs came next, driven by Beconnais and Wagner, with 35 seconds and 35 3-5 seconds respectively, and then a Serpollet driven by Madame Le Blon in 38 3-5 seconds. A Clement won the motorcycle section in 39 3-5 seconds. In the tourist section, Cabailot,

M. Le Blon on Gardner-Serpollet Steam Car.

M. Cabailot on 8-h.p. D. Dion.

M. Jeandre on the 70-h.p. Mors

THE DEAUVILLE SPEED TRIALS.

ments. It has been recognised that in standing start races a clever driver gets away before the starter has said the word "Go," and gains sometimes nearly a second on his competitors. This was prevented at Deauville by placing a wire across the track, which has to be broken by each competitor. At the word "Go," from the starter, the competitor has five seconds during which he must break the wire, and his time is taken, not from the word "Go," but from the time he breaks the wire, so that no object is gained in getting in front of the word "Go." Should any competitor, however, let the five seconds pass without breaking the wire, the starter breaks it for him and his time is counted from the moment it is broken. The weather was most favourable to

on an 8-h.p. De Dion, won the £160 and under chassis class (1 min. 2 2-5 sec.); Renaux, on a 16-h.p. Peugeot, the £160-£320 class in 51 3-5 seconds; Pelzer, on a Serpollet, the £320-£480 class in 42 2-5 seconds; Rasson, on a Clement, the £480-£640 class in 43 2-5 seconds; and Gasté, on a 20-h.p. Automotrice, the £640-£1,000 class in 1 min. 4 sec. The trials lasted about two hours, and were carried through without the least accident or incident.]

MR. BENNETT BURLEIGH, the well-known war correspondent, chartered a C.G.V. car for the autumn military manoeuvres, while Lieut.-Col. Pollock has been using an M.M.C. car.

SOUTH AFRICAN NEWS.

[FROM OUR OWN CORRESPONDENT.]

—★—

CAPE TOWN, August 26th.

FINE weather still continues, and business is not at all bad in the motor line. The Raleigh Cycle Agency are doing good business with the Oldsmobile. Two were shipped up-country the other day, to Dr. Houlthwaite and Mr. H. de Plessis, both of Philip's Town, C.C. I understand that Mr. J. A. C. Graaf intends purchasing a 16-h.p. Lancaster, and that Mr. D. P. Graaf, who owns a 22-h.p. Daimler and a 12-h.p. Brush, has intentions on a 7-h.p. Panhard for town work. The latest addition to the ranks of motorists in Cape Town is Mr. "Rheumaticuro" Jones, who has acquired a 6½-h.p. Gladiator. As his sobriquet implies, Mr. Jones is of patent medicine fame.

MR. L. RIVAS, of the Lace Diamond Mines, Kimberley, and residing on Belle Vue Estate, Sea Point, has imported a fine 12-h.p. Panhard. The body of the car is painted white, the wheels red, and the upholstery is finished in red buttoned leather, presenting a very attractive appearance. His driver,

BACK FIRING—A MISAPPLIED TERM.

THE word back firing is applied in automobile terminology to three distinct phenomena. It was originally used in connection with petrol engines, to denote the fact that the inflammable mixture in the carburettor and inlet passage had become ignited, owing to imperfect closing of the inlet valve or the production of a spark at the wrong time. In connection with two-cycle engines the term back firing is used to indicate that the flame has passed into the crank chamber and ignited the charge therein. Users of steam cars also use the term back firing with reference to the burners of their machines. Everybody who has used a laboratory Bunsen gas burner knows that sometimes in adjusting the flow of gas to the burner the flame travels down the tube of the burner to the air openings at the base of the tube and burns there with a roaring noise. Similarly, in a steam-car burner the flame, especially if the top plate of the burner has become leaky, will sometimes travel back through the mixing chamber to the mixing tube opening, and burn there, when the burner is said to be back firing.

In connection with petrol motor-cars the term back

A Motoring Party at Modder River, South Africa.

The photo was taken under Magersfontein Kop, where the Gordon Highlanders were cut up during the late war, and the trip was made to this place to select a site for the erection of a monument to the memory of General Wauchope and the Highlanders who fell there. Mr. W. E. Bush is at the helm, and next to him is Mr. J. Liddell, chief electrical and chemical engineer to De Beers, and in the tonneau are his daughters. The gentleman on the extreme left of the picture is Mr. Bissett, who owns the farm at Magersfontein.

Thomas, is a first-class man. He came out from the Panhard works, took part in the ill-fated Paris-Madrid race, and also in the Irish Fortnight. It is his second visit to South Africa.

MR. ED. A. COURTIS, of Cape Town, has on the water a "Holley" motorette from America. Mr. Courtis's previous car was a little 3-h.p. vehicle fitted with a Thomas engine. It was originally a tricycle with a basket seat over the two rear wheels, and was then the property of Mr. J. W. Courtis, who now runs a Baby Peugeot. The car was the first, and I believe the only one, ever built in South Africa. It was turned out in its original state from Garlick's shops, and was fitted with a light body and tiller steering afterwards. The carburettor was of very original design, consisting simply of a piece of 1-inch gas-pipe, with a hole in the middle through which the petrol dripped by gravity from the tank, the amount being regulated by a needle valve. Over the open end of the pipe which communicated with the air was a slide to regulate the amount of air taken in. I have made 25 m.p.h. on the level with this little car. The last I had to do with it was being thrown out, through the front forks snapping while making a good fifteen miles an hour.

firing is sometimes also used to describe what is, remarks the "Horseless Age," more generally and more properly referred to as a back kick of the motor. When the motor is being started by turning it over by hand, if the ignition occurs too early the starting crank may be jerked from the hands of the person trying to start the motor and the crank turn over in the wrong direction. The term back firing should never be employed to designate such an occurrence, as the use of the word for this purpose is likely to create confusion. Without this application the term back firing has a definite meaning as applied either to petrol or steam automobiles, and all cause for misunderstanding is avoided.

THE Earl of Kimberley attended a meeting of a committee of the Norfolk County Council on Saturday, and said he intended at the next meeting of the Council to suggest that it should be made obligatory on the owners of all vehicles to carry lights.

At the Brompton County Court, on Tuesday, the Kensington Motor Company, Limited, 64, Hammersmith Road, W., obtained judgment for £5 15s. from Mrs. C. Greene, of Shepherd's Bush, W., the claim being in respect of professional services rendered in teaching defendant's son to drive a motor-car.

MOTOR-CYCLING NEWS.

THE reliability trial of the Moto-cycle Club de France is to be held during the second fortnight in October. The competition is on the lines of that recently held in this country, the distance to be covered in six daily runs aggregating 1,040 kilometres. The start will take place each day from Paris, Chartres, Vernon, Corbeil, Chantilly, Beauvais and Evreux being visited. Points will be awarded for regularity of operation, brakes, stability, weight, fuel consumption, etc.

On Saturday last the Motor-Cycling Club held a non-stop test for two-seated motor-cycles with two or three wheels. The course mapped out was about 100 miles, and consisted of four trips to and fro between Godstone and a point on the Lewes road within six miles of the latter place. The route was a fair one and sufficiently trying to make the test useful. Out of thirteen entries, ten faced the starter. These were F. R. Johns, J. Van Hooydonk, W. F. Lord, C. W. Brown, F. Garner, A. C. Wright, J. Platt-Betts, A. W. Hacking, W. J. Milligan, and A. J. Brooke. Each driver had to carry a passenger whose weight was not less than ten stones. A maximum speed of 17 miles an hour was permitted over the trip, the minimum being twelve. Each rider was started independently, and was under

Mr. A. W. Hacking on the Ormonde near Lewes.

surveillance all the way, so that there could be no doubt as to the authenticity of the results. Five completed the run, viz.:—W. F. Lord (Ormonde), F. R. Johns (Humber), J. Van Hooydonk (Phoenix), A. C. Wright (Ormonde), and A. W. Hacking (Ormonde). With the exception of Lord, all those who finished had slightly exceeded the speed limit, and the Committee are to meet shortly to decide to whom the prize will be awarded. Another 200 miles reliability test, on the North Road, is to be held by the Club on the 26th inst., starting from the Red Lion Hotel, Hatfield, at 6 a.m.

PROMOTED by the Dublin centre of the Motor Cycling Union a motor-cycle reliability trial was held on Saturday last, nine of the eleven entrants finishing. The course was from Inchicore to Maryborough and back, a road familiar enough to motorists during the Irish Fortnight. Previous heavy rain had made the roads in a very greasy state. The distance of the trial was 96 miles and was divided into seven sections. The legal limit of speed was fixed as the maximum pace between each of the stations, and any rider gaining on the minimum time allowed for each section lost 15 marks per minute, while any rider covering the distance in less than the minimum time, but faster than the maximum, lost 5 marks per minute for every minute so lost. A rider failing to cover the section in less than the maximum time

was disqualified. The gross times of those who finished were as follows:—E. Martin (Excelsior), 5h. 38m. 15s.; T. W. Houghton (F.N.), 5h. 41m. 15s.; A. Summers (Triumph) 5h. 45m. 15s.; R. W. Stevens (Star Griffon), 5h. 48m.; A. Huet (James), 5h. 48s.; L. R. Oswald Sealy (Brown), 5h. 50m. 15s.; J. J. Cobier (Roebuck), 5h. 50m. 15s.; H. Shaw (Excelsior) 5h. 56m. 15s.; A. Franklin (F.N. Fore-carriage), 6h. 4m.

HEREWITH we illustrate an American design of motor tandem bicycle. It is made by the G. H. Curtiss Manufacturing

Co., of Hammondsport, N.Y., and is fitted with a 2½-h.p. motor having a bore and stroke of 3 inches. It is governed by the ignition and inlet throttle, and has an exhaust valve lifter for relieving the compression. The main shaft bearings are provided with twenty-five ¼-inch steel rollers which are held by bronze retainers between ground steel bushes. The speed ratio of the tandem drive is seven to one. It is rated at 30 miles maximum speed. The machine is entirely controlled by the front rider, the rear seat being intended for a lady, a guard being provided over the driving belt.

At the Brighthouse Police Court, Edward Farrar, of Halifax, was summoned for not giving audible warning when riding a motor-bicycle in the streets of Brighthouse. Instead of appearing the defendant had sent a registered letter to the Bench, in which he stated that the noise caused by the explosions of his motor was, in his opinion, quite sufficient warning. It was stated that the legal requirement was warning by "bell, horn, or otherwise." The magistrates held that the noise of motor explosions could not be considered sufficient warning, and ordered Farrar to pay a fine of 5s. and 8s. 6d. costs.

THE German Motor Cyclists' Union is organising a 1,000 kilometre motor-cycle reliability trial on the lines of that recently held by the Auto-Cycle Club. It was at first proposed to hold it at the end of the present month, but it has been decided to postpone the event till next spring.

THE Criterium du Quart de Litre for motor-cycles organised by "L'Auto" is now in progress at the Parc des Princes track. No less than 87 entries have been received for the competition, which will come to an end on Sunday, the 20th inst.

THE "X'l all" is the name of a new belt hook for motor-bicycles which has lately been put on the market by the Eclipse Motor and Cycle Company, of Birmingham. The hook is so

clearly shown in the accompanying illustrations that no description is necessary. It may be mentioned, however, that no holes are required to be made in the belt, and that the joint is claimed to run smoothly over the pulley.

SOME USEFUL NOTES.

It will, of course, take some time and much careful thought to determine which particular car will best fulfil the requirements of the purchaser. This once decided, if the manufacturer issues an instruction book—and many now do—a copy should be procured, and by the aid of its illustrations, diagrams and descriptions a careful study made before the vehicle arrives. When the new car is received a closer study of its construction may be made. Do not take anything for granted. Go into every detail. Observe particularly the action of the control levers, the steering mechanism and brakes. If a demonstrator or instructor is in attendance get him to show you why a certain action produces a certain result. It is hardly sufficient that you should know merely that it does do it. Find out why. Thus you will soon be able to judge cause from result, and this knowledge is the most valuable of all.

HAVING satisfied himself that the mechanical details are all in perfect adjustment, it is necessary that the new owner should attend to the lubricating system with the utmost care. Heavy cars are usually fitted with oil and grease reservoirs that supply

crank case supplied, in this event, always with a reasonably fresh charge, the old oil being drained off before the new is poured in. A small cock is provided at the bottom of the case for this purpose, and care must be taken to always close this cock before renewing the supply. This caution, remarks the "Automobile," may seem superfluous, but forgetting to close the cock is, nevertheless, a very common error. Never fill the crank chamber too full; otherwise the oil will work its way into the combustion chamber, fouling the sparking plug, gumming the valves and causing much unnecessary trouble.

In general it may be said that nothing should be taken for granted in the lubrication of a motor-car. Everything should be done to make the work of lubrication as easy as possible by having every convenience at hand. The plugs and cocks designed for the drawing off of the spent oil from crank cases should be carefully looked after to see that they cannot drop out while running. If an undue amount of oil drips from any particular point of the vehicle, it may indicate either that the supply is excessive, that means for retaining it are not proper, or that the oil is too thin. Thick oil on the whole gives little trouble from working out of bearings, especially when everything

The Novel Electrical Vehicle used in New York for Sight-Seeing Purposes. (See issue August 29.)

[The Automobile.]

the various bearings by means of feed tubes. Small cars, as a rule, are equipped with individual oil and grease cups. The covers of these should be removed and the cups filled if empty, as is frequently the case on a new car. The cylinder cup must be filled with a high fire-test mineral gas engine cylinder oil and not a vegetable or animal oil. There are a number of special oils on the market, and it is a good plan to buy a gallon or five gallon can for reserve, carrying on the vehicle a quart or so for immediate requirements. Keep this can always well filled. Remember that oil is just as essential as petrol.

For the bearings any good machinery oil is suitable, and it is well to have a reserve supply on hand, carrying a good-sized full oil can with you when on the road. An oil can with a long, slender curved spout will be found very useful. If no suitable carrying space is available, the spout may be unscrewed and a cork fitted to the can. If grease cups are provided it is an easy matter to procure a supply of suitable grease, which should not be too thick to feed the bearings properly. In many instances petrol motors are lubricated on what is known as the "splash" principle. That is to say, the crank chamber is partially filled with oil which is thrown into the cylinder by the action of the crank. It is very necessary to keep the

is worn. The "wiping off" of a car is a duty which no one having the instincts of a mechanic will shirk, as the dust which an excess of oil on the outside surfaces of the wearing parts is constantly collecting proves very injurious to the mechanism.

In their useful handbook, the Continental Tyre Co. point out that care should be taken to have the tyres always fully inflated and the nuts properly tightened, so as to give water no chance of getting into the tyre, otherwise the cover may get prematurely destroyed and have to be replaced by a new one. The chief cause of water getting into the tyre and causing its canvas backing to rot is slackness of the tyre and insufficiently tightened nuts. When the tyre is not sufficiently inflated, the edges of the cover do not fill out the grooves of the rim, thus leaving sufficient free space for water to get in. The same applies also to loose nuts. Between the rim and the nuts is a little leather washer intended to close the hole in a watertight manner. If the nut is loose, it does not press the washer tightly against the rim, and water finds its way in at the sides.

THE Lanchester Engine Co., Ltd., have facilities for a large output of their new 16-h.p. cars as well as the 10-h.p. vehicle.

HINTS ON CHOOSING A SECOND-HAND CAR.

THERE is no doubt that the intending motorist to whom economy is an object will often be well advised in preferring to purchase a second-hand car of good make rather than a new vehicle of lower price; due caution and circumspection in concluding the bargain being understood. Where the assistance of an unbiassed expert can be called in the purchaser may have an easy mind; in default of this a *resume* of some of the chief points on which a buyer should satisfy himself may prove useful.

A trial trip will usually be demanded and accorded, which will give the opportunity for much valuable observation as to the condition of the car. Excessive noise from the gearing betrays wear, and the buyer should insist on examining this; a car need not necessarily be rejected on this account, as it is often as well for the novice to learn on the old and worn gearing, and put in a new one when *au fait* with it; the cost of which, probably between £12 and £20, he will of course have to consider in valuing the car. It should be noted, however, that some cars wear out their gears fast, relatively to the other moving parts of the vehicle; or they may have been unduly worn by unskilful driving; while in other cars with very ample gear dimensions any serious deterioration thereof may indicate an amount of hard work that has affected the car throughout.

Mr. C. A. R. Langley, son of the ex-Engineer-in-Chief of the Midland Railway, on his 16-h.p. Deauville Car.

In live-axle cars, the state of the axle requires attention, and if the purchaser cannot have it dissected for his benefit, as is most likely, it should be jacked up, and any looseness in the bearings tested by shaking the back wheels. If they are ball bearings, excessive looseness may be taken up, unless bad enough to require new cups and cones, but the re-bushing of plain bearings may be a more expensive job. Next, one of the back wheels may be blocked and the other rotated, at the same time grasping the propeller-shaft. This will indicate roughly the extent to which the bevel gear and the differential is worn, and the shake in the universal joints of the shaft can be felt at the same time, as also in the shaft of the bevel wheel where it enters the differential box.

It is seldom indeed that the back view of a live-axle car is seen without the eye being offended by the "splaying" of the hind wheels. Much of this is due to wear in the axle bearings, but in some light cars there is an evident sag in the axle sleeve. Where this is the case, one would be inclined to give that car a wide berth, as the increased and unnecessary side strain on badly splayed wheels is obviously very great, apart from the weak construction thereby indicated.

The running of the engine will usually speak for itself; any knock or shake will make itself audible, especially if, with a two

or more cylinder engine, it is run first on one cylinder only, then on another, by disconnecting one or other high-tension wire. This test will often detect a looseness in the connecting-rod or crankshaft bearings that otherwise escapes notice. Here, too, it may be worth while mentioning the use of a length of rubber tube (used as a stethoscope) to locate any unusual noise in machinery that cannot be "spotted" otherwise: one end being applied to the car, and the other moved about over the suspected sources of the noise. Ignition troubles, or difficult starting should not impress a purchaser so unfavourably as they generally do: a secondhand car often wants re-wiring, which is not an expensive job; while a car may run ideally on its trial trip, and yet be in the latter state of the deacon's famous "one-hoss shay." Neither should paint and upholstery lead the unwary astray: they are cheap compared to engineer's work.

Looseness in the steering should be looked for, especially in the steering pivots, which usually having no adjustment will give some indication of the wear the car has had, unless, of course, it is so old that they have had to be replaced or re-bushed. The amount of play in the steering wheel is easily tested and located, whether in the worm or other gear at base of steering post (where it is often adjustable) or in other joints of the connections. A car has one notable advantage over a horse, that the unwary purchaser is hardly likely to be saddled with a bargain that is absolutely worthless; but he will do well to consider carefully the probable necessary replacements his car may require, assuming it to be generally in fair order. It is impossible to enumerate all possible requirements, but among them may be mentioned, commencing with the important ones—

New gear. (If one speed only worn, can it be replaced without entirely replacing gear?)

New pump. Those of cogwheel type usually wear out easily.

Tyres. How much life may be expected of them?

Chains. Ditto.

Re-leathering or lining brakes.

Re-wiring car.

A few final remarks may be added, some of which may seem almost supererogatory, though founded on actual cases that have come under the writer's notice. Secondhand cars of little-known makers should be carefully avoided. They may have been experiments, or failures. With the productions of the few really first-class and old-established makers, the purchaser will be generally fairly safe, but let him satisfy himself of the date and type of the car. Occasionally an early and an improved pattern have had little apparent difference in appearance, at least to the novice, who has been "had" thereby. There are a large number of good, though not front-rank firms, who turn out satisfactory cars at the present time. It does not follow, however, that their earlier productions would be worth purchasing; in fact, in many cases they were rubbish. Light and cheap cars are to be eschewed unless they are nearly new; on the other hand, some of the old and slow cars, both cheap and otherwise, may do very good service in the hands of purchasers who want something at a very low price, and do not demand speed. Good value from a practical point of view may thus often be obtained from an obsolete pattern of car; but it is advisable to find out what are the chances of getting any necessary replacements. If these have to be specially made they are apt to be expensive, though, on the other hand, makers sometimes charge absurdly high prices for small parts—a most unwise policy on their part.

In conclusion, it may be said that the purchase of a good make of second-hand car that has had, say, less than a year's wear in good hands is a wise proceeding for a novice, but he must expect to pay a fair price for it; the search for a "real bargain" needs to be conducted with more circumspection, and not without a fair amount of technical knowledge.

STEPS are being taken to form a motor club for Oldham and district. Those interested in the scheme should communicate to Mr. T. W. Hilton, Bath Street, Oldham.

HERE AND THERE.

TO-DAY (Saturday) the Sheffield Automobile Club will hold a run to Baslow.

DR. LANE-JOYNT, the well-known Dublin motorist, has just purchased a 20-h.p. M.M.C. car.

THE Automobile Club of Toronto, Canada, has established a garage for the use of its members.

THE Post Office is employing a motor-van for the delivery of parcels from Sunderland to Newcastle.

A NEW use for motor-cars has been found in America, their value as pacing machines for racehorses having, it is said, been demonstrated at Dayton, O., recently, when a famous trotter,

The Trotting Horse of the Future. *(Das Schnauferl, Munich.)*

known as Cresceus, covered a mile in 2 min. 8 3-4 sec., breaking the record for a half-mile track. The owner of the horse recently purchased a White steam car and utilised the vehicle for pacing purposes with the above mentioned result.

THE International Motor Company have just sent out two "Portland" cars to Senor Juan L. Trillia, Buenos Ayres, Argentine Republic.

AMONG the papers to be read during the forthcoming session of the Birmingham Association of Mechanical Engineers is one on motor-cars.

THE exports of automobiles and parts from the United States during July amounted to £31,947, as against £26,614 for the same month of 1902.

The Hon. Adrian Cave has been appointed a lieutenant in the Motor Volunteer Corps, and Mr. H. H. Paynter has been promoted to a lieutenancy.

KING EDWARD VII. passed through Epping recently on a motor-car. He went as far as Thornwood (two miles beyond the town), which is at the northern extremity of Epping Forest.

AN ingenious leaflet on the Horbick car, introducing some forty quotations from Shakespeare's plays, has been issued by Messrs. Horsfall and Bickham, of Pendleton, Manchester.

THE Hythe Town Council is seeking an interview with the Town Council of Folkestone with a view to adjusting differences that have arisen with regard to the licensing of motor-car drivers.

THE Darlington Rural Council has unanimously decided to memorialise the Local Government Board with the suggestion that the result of the taxation of motor-cars should be given to the local revenue.

As a result of careful investigation of the relative cost, it has been decided by the Board of Public Works of Saginaw, Mich., to substitute a motor-car for the horse and trap used by their superintendent.

MESSRS. OLIVER, CLARK AND COMPANY have taken larger premises at St. Mark's Road, Notting Hill, W., where they have established workshops, with facilities for repairing motor-cars, charging batteries, etc.

TONI TYRES, LIMITED, is the title of a new company registered with a capital of £10,000, to carry on the business of

manufacturers of pneumatic and other tyres, and to adopt an agreement with Messrs. F. Toni and J. Gill.

THE Automobile Club of America is organising an autumn club run or tour, starting on the 25th inst., and finishing on the 30th inst. Hartford, Boston, Springfield, and Poughkeepsie, N.Y., will be visited. The total journey will be 527 miles, and already thirty members have enrolled for the trip.

FOLLOWING the example of the Boston Y.M.C.A., the Minneapolis Young Men's Christian Association is organising a course in petrol motor engineering as applied to automobiles and launches. The course will include the study of motors of various types, transmission gears, carburettors, ignition apparatus, etc.

THE Empire Trotting Club, of New York, is arranging a further motor race meeting. The secretary of the Club is reported to have written Jenatzy, Gabriel and Jarrott offering expenses, a share of the gate receipts and a liberal guarantee for a race with Barney Oldfield as the chief attraction of the meeting.

WHAT may be considered an achievement in the art of burglary was accomplished by some men who entered the house of Mr. H. J. Ferry, 5, Streatley Road, Willesden, and, among other things, stole a 4-h.p. motor-car from an outhouse. Their performance is, however, rivalled by those who entered the motor-car works, Ridgway Old Chapel, Towcester, and drove off in an automobile.

M. COMBES, the President of the French Parliament and the Minister of the Interior, has just taken a step which will certainly earn for him the gratitude of all automobilists. He has sent a circular to prefects throughout France instructing them to annul all Mayoral ordinances which limit the speed of automobiles unless they also apply them to every other form of vehicle. M. Combes' circular is dictated by common sense and is in accordance with the doctrine of equality, which is one of the basic principles of the republic.

OWING to increased business, the General Motor-Car Co., Limited, of Norbury, S.W., have taken extensive premises covering over two acres of ground, and also a large enclosed trial ground, situated at Common Side East, Mitcham. The new works have been fitted up with a plant of the most modern machinery, so that they are in a position to cope with any make or size of car. The show room and also the garage and repair shop, at London Road, Norbury, will still be maintained.

THE accompanying illustration shows a novel Duryea car recently supplied to a Japanese gentleman. It has accommodation for six persons, and weighs 1,000 pounds. It is equipped with

a 10 to 12-h.p. triple-cylinder engine, the long wheel base and low centre of gravity being features of interest.

A NEW electric racing car named the "Torpedo Kid" has recently been completed by the Baker Motor Vehicle Company, of Chicago. It is designed on the same lines as the "Torpedo," which attracted much attention last year, but is much smaller. It weighs only about 700 pounds and is fitted with the standard Baker motor and twelve cells. The wheels are fitted with two-inch tyres and wind shields. The steering apparatus has been improved and the car is somewhat longer than the old Torpedo. The body differs in shape and is designed to offer the slightest possible resistance to the wind.

SOME trials are about to be made in Berlin with the sprinkling of petroleum on the roads with the view of laying the dust. To acquire the business of motor accessory manufacturers, etc., carried on by Mr. F. S. O'Brien at Coventry, the firm of Edward O'Brien, Ltd., has been registered with a capital of £7,000.

AN "Old Home Week" automobile parade was held at Bridgeport, Conn., U.S.A., on [the 31st ult. As an automobile

The Locomobile Band Wagon.

parade the event was unusually interesting, owing to the large number of automobiles, decorations, etc., but the principal feature by far was the Locomobile band wagon, which carried a band of twelve pieces, together with two attendants. The band wagon, of which we reproduce a photo herewith, was built up on an ordinary 16-h.p. Locomobile petrol chassis, the entire outfit weighing nearly three tons.

It may be interesting to mention that the two illustrations we gave in our issue of the 5th inst. showing the multitudinous details of a small motor-car represented those of the Baby Peugeot.

DR. H. NELSON JACKSON has accepted an invitation to lecture before the Automobile Club of America next winter on his experiences during the long journey from San Francisco to New York in a Winton car.

MESSRS. DOCKER BROS., of Birmingham, are devoting their attention to a special method of preparing a quick-drying paint and varnish for motor-car bodies. Several cars in the Reliability Trials are, we understand, painted and varnished with their latest preparation.

SAINSBURY'S ANTI-SKIDDERS, LTD., is the title of a company formed with a capital of £10,000, to acquire of Mr. W. D. Sainsbury an invention for a skid-preventing device for the rubber tyred wheels of automobiles, etc. The public are now being invited to subscribe capital for the development of this device, of which several well-known experts have reported very favourably.

MR. C. GLIDDEN is not the only motorist enjoying an Arctic circle trip, a similar tour being at present made by Mr. H. Thobro, secretary of the Bloomington Automobile Club, Bloomington, Ill., U.S.A. He started from Helsingborg, Sweden, and, choosing the west side of Norway instead of the east side of Sweden as his route, has already reached Namsos, a little town on the Fjorden, Norway, 1½ degrees south of the Arctic circle.

MESSRS. H. ANDREW AND COMPANY, Yealmpton, near Plymouth, have sent us a small sample box of their new Simplex

ignition wire terminals, which take the form of large brass eyelets. The end of the wire being bared for about ¼ inch, the strands are halved and placed round the eyelet. It is then clinched with a hammer, making a very neat end to the wire. The terminals or eyelets are put up in small boxes and sold at a popular price.

ACCORDING to a New York telegram, the motor track race meeting at Detroit, on the 10th inst., was marred by a fatal accident owing to the front tyre of the Winton racer driven by Barney Oldfield bursting. The car instantly swerved, killing a spectator standing by, and then flew off the embankment. It turned over, and landed a perfect wreck. Marvellous to relate, Oldfield escaped with no more than three ribs broken.

MR. AND MRS. RICHARD BILLINGS, who went to Ireland from New York, for the Gordon Bennett Race, prolonged their stay in order to make a tour of England, and covered a total of over 1,300 miles, using a "Locomobile" weighing about 3,000 lbs., shod with Fisk detachable tyres, 28 by 3 in. They covered the entire distance without a single puncture and with no mechanical troubles whatever, the tyres being pumped up but once during the whole journey.

MESSRS. NEWTON AND CO., of Deansgate, Manchester, who have taken over the business of the Manchester Garage Co., 35, King Street West, Manchester, will in future make the latter premises their head depot. They are centrally situated, having large showrooms and workshops on the ground floor, together with washing and storage accommodation for fifty cars. Repairs and hiring are to be made a speciality, while a large stock of tyres, petrol, sundries, and motor clothing will be kept.

THE most powerful of automobiles will compete in the race meeting which is to be held on the Washington Park track, Chicago, on the 26th inst., under the auspices of the Chicago Automobile Club. The contestants will be Barney Oldfield, who will ride Owen's Gordon Bennett Winton; Mooers with his Gordon Bennett Peerless; Carl Fisher and Earl Kiser, the latter two each driving new 80-h.p. cars known as Mohawks.

The Oldsmobile Car at present on a Journey from San Francisco to New York.

The famous "999" car, in which Barney Oldfield made his mile in 55 4-5 seconds, will also be driven by Cooper. Every car in the race will be of not less than 80-h.p. The two new Mohawk racers have four horizontal cylinders 7 in. dia. by 7 in. stroke and chain transmission, more than three-quarters of the length of the chassis being taken up by the engine and cooling mechanism.

NEW GUIDE BOOKS.

A USEFUL series of Guide Books is that issued by Messrs. Methuen and Co., in a size convenient to the pocket, and of a character likely to be acceptable to touring motorists. The volumes issued include Cornwall, the Malvern country, Surrey, Oxford, Hertfordshire, Kent, and the Shakespeare country, and as all are based on the same excellent plan,

The Medway at Aylesford.

a review of that concerned with the county that excited the admiration of Michael Drayton—

"O famous Kent, quoth she,

What county hath this isle that can compare with thee?"

will be of service as well as interest.

Fifty well-written pages give a succinct account of the physical features, communications, climate, industries, and other information helpful to the traveller by road. One of the most interesting roadways in the county is the Pilgrims' Way, running along the southern slope of the North Downs. From the extreme ends of Kent runs Watling Street, connecting Dover to London by way of Canterbury, Faversham, Rochester, Dartford, and Greenwich. Generally the road surfaces are excellent, the flint from the chalk in some districts, and Kentish rag in others, being used as metal.

The major portion of the work, comprising about two hundred pages, is devoted to brief descriptions, in alphabetical order, of the various places in the county, the whole being a tribute to the local knowledge and the literary skill of Mr. George Clinch, F.G.S. Mr. F. D. Bedford's illustrations, of which we give two typical examples, deserve more than a passing reference, did space permit. Aylesford has a charming 14th century stone bridge over the Medway, and is situated about three miles to the north-west of Maidstone. Its most notable relic of past ages are the megalithic remains at Kit's Coty House, on the side of the chalk hills. One of the most beautiful Kentish villages is Chiddingstone, near Tonbridge, its picturesque half timber houses being noteworthy—even in such a delightful county. Messrs. Methuen's guides are a model of lucidity, and their covers are as full of sound digestive matter as an egg-shell.

Another excellent literary guide comes from Messrs. George Newnes, Ltd., in the "Shakespeare Country Illustrated," which is made all the more widely acceptable by the maps and appendices which illustrate the Washington and the Franklin countries. The letterpress is by Mr. John Leyland, and reveals a close knowledge of the district about Stratford-on-Avon. The illustrations

are not only finely produced but carefully selected, and Mr. Leyland has taken a broad view of his work as guide to this interesting district, for Warwick, Kenilworth, Stoneleigh, and the Shakespeare villages are all included in the survey. Of special interest to American visitors will be the chapters devoted to Sulgrave, Ecton, and other places associated with Washington and Franklin, often visited from Stratford-on-Avon.

An interesting record is that of the Cinque Ports, the towns at the south-eastern corner of which, in years gone by, played an important part in the history of the country. Now they serve as holiday resorts for jaded citizens, as the termini for some of the days' trials of the Automobile Club, and as subject matter for authors like Mr. J. Bavington Jones, whose interesting work has just been published at the office of the "Dover Express." The first part of this well-written volume is historical, the second descriptive, while the illustrations of the ancient towns remind us of many modern aspects. Altogether the book is one likely to be much in demand by visitors to any of the places whose chronicles are set forth therein.

A guide to the towns and pleasure resorts upon the Lancashire and Yorkshire Railway system has just been issued by the company, the editor being Mr. F. Goldring. The company was incorporated in 1874, and progress has been conspicuous since then, the operations of the company extending from Southport to Hull. Among the health resorts tapped by the line are Lytham, Blackpool, Scarborough, and Harrogate, and motorists in any of those districts will find the L. & Y. willing to deal reasonably and carefully with their cars.

Printed in the French language is a capital guide to Hastings published by a local association which is seeking to attract continental visitors to that pleasant town. Historically interesting to the people of France, there is no reason why the publishers should not be successful in influencing many people from abroad to stay in the locality of Hastings. The little volume is admirably illustrated and the enterprise that has led to its being issued in the French language will probably be imitated by other resorts.

THE first 1904 catalogue of motor accessories to reach us is

In Chiddingstone Village

that of Messrs. Markt and Company; it gives particulars of their various specialities, including Veeder odometers, speedometers, gradometers, bells, horns, oilers, jacks, lamps, etc.

SINCE their excellent series of performances during the Irish Fortnight Duryea cars seem fairly to have "caught on" in Society circles. Many fresh orders have been placed with the company, amongst the latest purchasers of Duryea cars being the Earl of Northampton and Sir Charles Cameron.

CORRESPONDENCE.

THE LIFE OF MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It is now close on seven years since the Act of 1896, by which the red flag was abolished, came into operation, and as the number of cars in use has been steadily increasing since that time, much information must now be available as to the life of a motor-car, a question of great interest to many who, like myself, are hesitating ere investing in an automobile until it is possible to get some idea as to how long the vehicle will last in actual service, or how long it may reasonably be expected to be capable of doing efficient work. The more wealthy class of motorists are able to dispose of their cars in order to go in for more up-to-date vehicles, as these make their appearance, just as a certain class of cyclists make a practice of getting a new machine each season, but there is a large and growing section of automobilists who have not the means to be thus continually changing their vehicles, and to whom the life of a motor-car is consequently a vital question. May I, therefore, suggest that any motorist who has had his car for a number of years would be doing a service to many would-be owners by sending an account of his experience in the way of cost of upkeep, etc.—Yours truly,

A. G. L.

AN "ACT" OF DISCOURAGEMENT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read the article by my old friend Mr. Norman Macdonald in your valuable paper for last week.

The whole article might be justifiable if it were based upon facts. The foundations, however, are imaginary and never did exist; therefore the superstructure must needs be incorrect and becomes fiction.

My friend Mr. Macdonald appears to be unaware of the existence of the Legislative Committee, or ignores it. He certainly is unaware of the doings of that committee, who have spent a great deal of time, and it is hardly gracious to suggest that such men as Sir Francis Jeune, Sir Hickman Bacon, Earl Russell, Mr. Roger Wallace, K.C., Colonel Crompton, C.B., and others who have worked so hard on this committee, have done nothing.—Yours truly,

T. W. STAPLEE FIRTH.

SPEED INDICATORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Though there are speed indicators on the market, I am afraid your correspondent "M. P." will not get exactly what he requires. It may be some consolation to him to know that the very thing he wants, an automatic speed indicator, is in existence, and is only waiting for a reliable firm with the necessary machinery to take it in hand; there is, therefore, every prospect before long of his wants being supplied.—Yours truly,

A. L.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to "M. P." I think Dr. Winter's speed indicator would suit him perfectly. It has a large clear dial registering up to 60 m.p.h. I have had mine 19 months. The cyclometer with which it is fitted is most useful in keeping a record of the running of the car as regards tyres, repairs, etc. Its position is on the dash-board, right under the eye of the driver.—Yours truly,

A. C. H.

16 FEET ROADS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With regard to the closing of 16 ft. roads for motor traffic, it seems that (in Scotland at least) roads under 16 ft. wide are a contravention of the statute, and I would suggest that the Motor Union or some other body, or perhaps the writer of the article "An 'Act' of Discouragement," in your last issue, should look into this matter. My authority for this statement is the report of a meeting of a County Council, at which the reply of the Lord Advocate to a query of the council was read. The query had evidently something to do with the width of certain roads, and was to the effect that the statutory width was something like 20 ft., which seemingly staggered the worthy members, who passed a resolution to use every endeavour to get this limit altered. This happened some months ago, and before there was any word of a 16-foot limit, so that my memory may have played me false, but I think it is worth looking into.

Most of the old "statute labour" roads were much wider than 16 feet originally, but a great many of them have been utilised by farmers and others for depositing all manner of rubbish at the sides, such as stones carted off their fields, "compost heaps," etc.

I think that the whole of the "Acts" relating to roads might be looked into, and a summary might be published, so that motorists would know what users of the roads were entitled to.—Yours truly,

MOTOR CYCLIST.

PERPLEXED writes: "I should be glad to know if, in addition to the two guinea license I always pay for my car, I should be required to

have my car registered and pay another twenty shillings; also, being my own driver, whether I should have to have a driver's license to the tune of five shillings more. [The new registration and drivers' licence charges are undoubtedly an addition to the ordinary Inland Revenue licence.—ED. M. C. J.]

AUTOMOBILISM AT THE BRITISH ASSOCIATION.

MR. CHARLES HAWKSLEY, the President of the Engineers' Section of the British Association, which has been holding its meetings at Southport, dealt very fully with automobilism in his presidential address on Friday last.

MOTOR-CARS ON COMMON ROADS.

At the beginning of the 19th century, he said, the population of the United Kingdom was nearly 15½ millions, at the beginning of the 20th nearly 41½ millions. Then there was not a mile of railway in the United Kingdom; now there were about 22,000 miles. Palmer in 1784 introduced mail coaches travelling from six to seven miles an hour on the main roads. In 1801 the mail coach from London to Holyhead occupied nearly 46 hours on the journey, and the mails reached Dublin on the third day after leaving London. Speed in locomotion appeared to be now the first consideration. The first practical steam carriage was used by Trevithick in the year 1802. Mr. E. R. Calthrop, M.Inst.C.E., was opposed to any weight restriction, but it was to be remembered that the momentum of heavily laden wagons drawn by a powerful traction engine at the maximum speed of five miles an hour, was very great, and caused uncomfortable vibration in the houses along main thoroughfares; on the other hand, light traction engines were now being successfully used, drawing from four to five tons of market produce through the streets of London without causing undue vibration, and at a cost said to be about one-half that of horse traction.

The use of motor-driven vehicles for road traffic was so intimately associated with improvements in prime movers that it was interesting to be reminded of the opinion expressed more than twenty years ago by Sir Frederick Bramwell, who in 1881 said:—"However much the Mechanical Section of the British Association may to-day contemplate with regret even the mere distant prospect of the steam-engine becoming a thing of the past, I very much doubt whether those who meet here fifty years hence will then speak of that motor except in the character of a curiosity to be found in a museum." To keep alive the interest of the Association in this subject, Sir Frederick Bramwell had kindly offered, and the council had accepted, the sum of £50 for investment in 2½ per cent. Self-accumulative Consols, the resulting sum to be paid as an honorarium to a gentleman to be selected by the council to prepare a paper having Sir Frederick's utterances in 1881 as a sort of text, and dealing with the whole question of the prime movers of 1931, and especially with the then relation between steam-engines and internal-combustion engines.

A paper was read by Mr. T. Clarkson on

STEAM CAR DESIGN.

He said that one reason for the popularity of the internal-combustion engine was the large number of flimsy steam cars of foreign manufacture that had been put upon the market. These cars, although running with the characteristic smoothness of steam, were otherwise very inferior in design and construction. In spite of the unsatisfactory nature of their construction, it was satisfactory, however, to know that out of 4,000 cars supplied to the public there had not been a single case recorded of a boiler explosion. Commercial automobilism covered an extremely wide field of usefulness, ranging from a light parcel delivery motor-cycle, or voiturette, to the heavy six-ton lorry. He looked upon an intermediate class, from about half a ton to two tons, as likely to be sufficiently large to justify the manufacturer in focussing his energies upon this one class. He claimed that the steam engine, as opposed to the internal-combustion motor, would work longer without attention or repairs. The steam engine needed less skill in operating, and possessed a larger reserve of power for emergencies. No complicated and expensive change speed gear was required, and with liquid fuel the dirty work of stoking was avoided; in addition to these advantages, the smoke trouble was removed. Beyond this, also, an efficient condenser had overcome the defect of exhaust steam being delivered to the atmosphere. The production of a good boiler has been found to rest almost entirely on the development of a good oil burner. Such an apparatus should be adapted to use the cheaper grades of oil which were everywhere obtainable and were safe to handle. With the use of petrol or gasoline the problem of burning was far simpler than when the fuel was kerosene or paraffin. The latter, however, was only one-third the cost per gallon of the former, it had a higher calorific value, it was safer to handle and store, and it could be obtained everywhere. Thick black oil could be burned with a blast of air or steam, but was liable to smoke occasionally, and starting was difficult. Paraffin had been found to work fairly well in an ordinary internal combustion motor for stationary purposes, but for automobiles it had not been so successful. It could, however, be burnt under a steam generator, either by a wick or on the spray system, so as to produce a perfectly unobjectionable product. Vapourizing, however, was the best method of working the oil mixing with the air as in a Bunsen burner. The great difficulty to get over was "lighting back," a defect which consisted of the flame passing into the mixing chamber. The best method of prevention hitherto tried consisted of making the mixture of oil vapour and air issue from the burner with velocity in excess of that of the propagation

of flame. To accomplish this it was necessary to maintain the velocity of efflux, but at the same time it was required that the burner should be flexible in capacity. These conditions needed a variation of the orifice of the burner in direct proportion to the amount of fuel consumed. When the burner was at full power the orifice should be opened to the maximum, and when the size of the flame was reduced the area of the openings should also be reduced proportionately in order to maintain the velocity of the efflux. The upper part of the burner would necessarily get strongly heated, and the arrangement for varying the area should, therefore, be as simple as possible. He had adopted a mushroom valve consisting of a circular disc carried upon a vertical stem. This would be raised or lowered to give a greater or less area for the escape of the fuel mixture. For the control of the paraffin oil vapour he used either a cone or a wedge introduced from the front into the jet nozzle. The cone was used at first and was moved in and out simultaneously with the lowering or raising of the mushroom valve. But it was found that the variation of the areas of the jet orifice and the burner orifice were not in the same ratio, the former varying in geometrical progression and the latter in arithmetical progression, the burner orifice thus varying in one dimension and the jet orifice in two. The jet orifice was, therefore, made rectangular, and this modification entirely got over the difficulty of "lighting back." He had tried various boilers, including the fire-tube, water-tube, the flash and semi-flash types. Finally he selected the first named as being superior in regard to general service and trustworthiness. Of the other types, he considered the semi-flash the best, when the size of the flame was controlled by the temperature of the steam. The flash boiler would stand over-heating, but its reserve of power was small; moreover, it needed higher skill for its management. With the fire-tube boiler, the risk of over-heating was practically eliminated when a good automatic water feed and burner control were used. A trustworthy automatic appliance for controlling the fuel and water supply was one of the most important features in a steam-driven car, and Mr. Clarkson devoted a considerable part of his paper to this question, some of the arrangements he described being of a novel and highly ingenious character. Superheating of the steam, he considered one of the chief means by which the steam car was able to compete with the petrol car. Steam at 650 deg. or 700 deg. Fahr. would work more economically, and would, therefore, enable the whole construction of the car to be lightened. Special attention, however, had to be paid to the cylinder packing. Circular valves were found to give good results.

Mr. Clarkson concluded his paper with a reference to the speed question. In the discussion which followed, Lt.-Col. Crompton said in the internal combustion engine an odour was caused by a part of the explosive charge being cooled on the metallic surfaces of the engine, and therefore not burnt. With perfect combustion there would be no odour from the products. In this respect steam had the advantage.

Mr. Sennett referred to the enormous expense of lubrication involved in the use of a flash-boiler. In some cases it approached in cost the expense of the fuel.

Professor Hudson Beare, as an old recorder of the section, thought that the paper was one of the most valuable that had been read for many years. The dust question could not be settled by improved road construction, and he gave instances of dust in large volumes being raised by low-bodied cars running on very good roads. Mr. W. W. Beaumont having spoken,

Mr. Clarkson, in reply, referred to the question of weight of cars. He was of opinion that often too much was done in the matter of lightening construction. Referring to details of construction, he objected to grease cups, as their replenishment, which was a dirty operation, might be put off. With a system of oil lubrication renewal of the lubricant was easy, and, as every bearing depended on one supply, it would not be likely to be neglected. Perkins metal for piston rings worked well with a mirror-like surface without lubrication, but had the disadvantage of being extremely brittle. In regard to chain drive, he had tried to do without the use of chains, but had come to the conclusion that that means of transmission was the best. He had increased the strength of the chains he used, not because he feared breakage, but in order to avoid stretching and the consequent loss of pitch. Chains were now used with a breaking load of $3\frac{1}{2}$ tons. In regard to connecting the engine direct to the axle, there was the drawback that road vibration would be transmitted to the crank shaft. The beauty of chain transmission was its flexibility.

STREET TRAFFIC.

Col. Crompton, R.E., read a paper "The Problem of Modern Street Traffic." The average speed of travel in large cities amounted to about five miles an hour. In order to quicken the enormous existing wheeled and walking traffic, the author advised the establishment of a department of the police to take charge of the street traffic. In order that a street might accommodate the maximum number of vehicles it was necessary that these should be driven in parallel lines as close to the kerb as possible. There would always remain a considerable difference in speed between wheeled vehicles, and it was necessary that the overtaking of vehicles should be carried on with the minimum waste of road surface. In a 40 ft. street it would be better to confine traffic in each direction close to the kerb, the remaining space being reserved entirely for overtaking and not to be encroached upon by opposing traffic. At three miles per hour, with an interval of 25 ft. between omnibuses, 16,473 passengers would be conveyed per hour, but at 12 miles per hour the number would be 65,892. On the other hand, with

an interval of 200 ft. between vehicles at three miles per hour, 2,050 passengers would be carried; at a speed of 12 miles per hour, with the same interval, 8,236 passengers would be conveyed. With motor omnibuses driven at 12 miles an hour at a 2.8 sec. time interval, nearly 33,000 passengers could be carried per hour. Such would be the result of introducing automobile omnibuses capable of accelerating up to 16 miles an hour, but running at a point to point speed of 12 miles an hour.

An automobile vehicle at twelve miles an hour could be pulled up in less space than a fully-loaded omnibus running at an average of seven miles an hour. Accelerating and controlling power was given in a high degree by the electric automobile, which Col. Crompton described as the vehicle of future town traffic. The steam-driven vehicle, however, had also the quality of control to some extent in common with the electrical vehicle. The petrol-driven vehicle was not so advantageous in this respect.

RESISTANCE OF ROAD VEHICLES TO TRACTION.

The report of the committee appointed to consider the question of the resistance of road vehicles to traction, of which Professor H. S. Hele-Shaw is secretary, was read. This described experiments made with various kinds of tyres on different descriptions of roadway and at varying velocities of travel. With iron tyres on a roadway paved with setts 6in. by 3in., having a regular but fairly rough surface, and with a 1in. gap between the joints, experiments were made with a lorry wheel 40in. in diameter having a 3in. iron tyre slightly rounded in section. The rate of increase of tractive effort diminished with the velocity. This suggestive fact was attributed to the circumstance that as the wheel travelled faster it had less time to fall into the little hollows in the roadway, merely skimming along the tops of ridges. With a load of 392lb. on the wheel, and at a speed of about $7\frac{1}{2}$ miles an hour, the tractive effort needed was about 21lb. to 22lb. This power increased until at about 13 $\frac{1}{2}$ miles per hour the tractive effort was a little over 26lb. Taking the highest curve in the diagram, which represented a load of about 952lb., it was shown that at about 8 $\frac{1}{2}$ miles per hour the tractive effort was about 38lb. to 39lb. The power acquired increased until at twelve miles per hour the tractive effort was 50lb. With the higher load, therefore, the curve was very much steeper than with the lower load. A wire-spoked wheel twenty-four inches in diameter, and having a 2 $\frac{1}{2}$ in. tyre, was tried on a level stretch of macadam road in fairly good condition, but slightly wet in places. With a load of 315lb., and a trifle over six miles an hour, the tractive effort was just under 20lb. Increase of speed brought a comparatively small addition to the effort needed to turn the wheel, for at about fifteen and a half miles per hour the tractive effort was registered at only about 2 lb. more, approximately 21 $\frac{1}{2}$ lb. With the heavier load the curve was steeper, for at 651 lb., and at about six and a quarter miles per hour, the tractive effort was about 37 lb., whilst at 15 $\frac{1}{2}$ miles per hour the tractive effort was about 41 lb. The difference between a light and heavy load was thus not so strongly emphasized as in the case of the iron tyre. The conclusion arrived at was that for heavy traffic wheels, tyres of more than about 9 in. in width had, in practice, little material value as tending to reduce road resistance or damage to the road surface. The theory was submitted that the supporting power of a road was limited by the cohesive friction of the road particles against each other. This supporting power-limit varied considerably according to the material and the moisture absorbed.

THE EMISSION OF STEAM.

MR. W. E. HELMAN-PIDSLEY, of the solicitor's department of the London County Council, appeared before Mr. Francis, at Lambeth, on behalf of the Council, to support two summonses against owners of light locomotives, the offence alleged being the emission of steam on public highways, which is forbidden by Section 3 of the Locomotives on Roads Act of 1865. In the first case, Mr. J. G. Miller, of Mitcham, was the defendant, the summons declaring that "the steam was allowed to attain a pressure which exceeded the limit fixed by the safety valve, so that steam was blown off." Police-constable 740 W stated that on June 25 a light locomotive belonging to the defendant was pulled up outside the Telegraph Inn, Brixton-hill, and stopped there for fifteen minutes, emitting steam the whole time. The defendant's driver urged that the steam was only just simmering from the safety valve. Mr. Francis ordered the defendant to pay a fine of 40s. and 23s. costs.

Messrs. Watney, Combe, Reid, and Company (Limited), of the Stag Brewery, Pimlico, were summoned for a similar offence in a side road at Brixton on July 23rd. Mr. Robinson, barrister, who defended, pointed out that there was no evidence that "the pressure exceeded the limit fixed by the safety valve." Moreover, the locomotive was so constructed as to come under the provisions of the Light Locomotives Act of 1896, and was thus exempt from the requirements of the Act of 1865. It was true that on the occasion referred to there was a slight emission of steam, but that was due to some grit having got under the valve. The pressure of steam was only 100 lb., whereas the valve was set at 175 lb. Mr. Helman-Pidsley contended that the case could not come under the Light Locomotives Act of 1896 unless the defendants could satisfy the court that the emission was due to an accidental or temporary cause. If a light locomotive emitted steam except from an accidental or temporary cause the case came under the Act of 1865, under which these proceedings were taken. After hearing some evidence Mr. Francis thought it would be sufficient if the defendants paid the costs of the proceedings—23s.

Where no alleged speed is given it is understood to be above the legal limit.

At the Newcastle-under-Lyme Police Court, William Vincent, motor agent, of Keele, was summoned for driving a motor-car at a speed that was greater than was reasonable. P.C. Price said he was "flabbergasted" at the speed of the car driven by the defendant. Mr. Vincent said he was only going at eight miles an hour. Mr. John Machin corroborated defendant, and Mr. James Cadman, jun., who was on a motor-cycle in the same road at the same time, estimated that he was travelling at from six to eight miles an hour. The Bench reserved their decision, until they heard a case against Charles Boote, captain of Volunteers, who was summoned for a similar offence. The chairman of the Bench then said they considered both cases proved, and there would be a fine of 40s. and costs in each case.

CLUB NEWS.

READING.

ON Wednesday of last week the members of the Reading Automobile Club were invited by Mr. and Mrs. Charles H. Dodd to meet at their residence in Maidenhead. A good many members availed themselves of the kind invitation and the run was very enjoyable. On arrival the members were entertained at tea, and after looking round the grounds and inspecting the motor vehicles assembled, the return journey to Reading via Henley was commenced. Mr. Dodd piloted the party through the intricacies of Maidenhead Thicket on his 8-h.p. Renault. The club is to be congratulated on having amongst its members such an enthusiastic automobilist as its host on this occasion.

NOTTINGHAMSHIRE.

ONE of the most interesting functions held in connection with the Nottinghamshire Automobile Club during the present season took place on Saturday afternoon last in the form of an informal hill climb up Kettleby Hill, near Melton Mowbray. The rendezvous was at Nether Broughton, and at three o'clock the following members of the club were present:—Messrs. G. H. Kirk, C. Evinson, A. R. Atkey, E. W. Wells, R. Cripps, R. R. Latham, J. C. Bennet, W. H. Warburton, M. Ross Browne, Chas. Hardy, H. Belcher, Dr. Atkinson, C. L. Schwind, S. Harvey, R. Harbidge, A. King, Col. Powell. The cars participating included Humber, Georges Richard, Daimler, Clement, Progress, Rex, Renault, King and Argyll. The conditions of the hill climb were that each car should be in touring trim and carry its full complement of passengers, the club offering a gold badge to the car which, in the opinion of the Races Committee of the A.C.G.B.I., should have accomplished the most meritorious performance. Messrs. T. Large and J. H. Soothern kindly officiated as honorary timekeepers. After some seventeen members had been seen on their way up the hill, Mr. Lloyd, who had driven down with Mr. S. F. Edge on a 35-h.p. Napier recently driven in the Gordon Bennett race by Mr. J. W. Stocks, made an ascent of the hill, but the "Piece de Resistance" was the drive up the hill by Mr. Edge on his big Napier. The spectacle was enjoyed immensely by those fortunate enough to witness the sight. The members afterwards dispersed in various directions for tea, some being the guests of Mr. W. Don Foster, at his residence, the Limes, Edwalton.

SOUTHPORT.

A MEETING of the Southport Automobile Club has been held at the Scarisbrick Hotel, under the presidency of Mr. J. H. Preston. There was a good attendance. Several new members were proposed, which brings the total up to nearly thirty. It was suggested that the club should arrange for the erection of a grand stand on the Promenade to be used during the Automobile Club trials. Some of the club members will probably enter for the Lancashire Club race in the trials.

MIDLAND.

THE Midland Club held their hill-climbing competition last Saturday at Sun Rising Hill. Only about 300 yards of the top portion of the hill was covered.

Three police traps were laid between Stratford-on-Avon and Sun Rising Hill, resulting in a number of cars and motor-cycles being stopped and names taken. Mr. H. Sturmeay was early on the scene on a bicycle, and found several policemen measuring distances on the road. He rode towards Stratford and warned several cars of the danger. Luckily for ourselves we travelled on a Siddeley car through Wellesbourne and Kington, and so missed the trouble.

Amongst those present were noticed Messrs. C. Vernon Pugh, E. J. West, O. Harmer, O. Baynton, F. Lancheater, G. Lancheater, T. C. Aveling (hon. sec.), etc., besides those who figured as competitors. The times were as follows, but the official declaration as to the result has yet to be made known.

Name of Driver.	Maker of Car.	Time of Ascent.	
		Min.	Secs.
J. A. Holder	24 h.p. Panhard	1	9½
H. A. Holder	16-h.p. De Dietrich	1	11
C. W. Dixon	10-h.p. Lancheater	1	55½
M. A. Lawrence	10-h.p. Lancheater	2	2
E. J. Hartenfeld	10-h.p. Lancheater	2	1½
H. Luff Smith	10-h.p. Wolseley	1	27½
A. E. Crowdy	20-h.p. Wolseley	1	16
Harvey du Cros	12-h.p. Ariel	1	22½

POLICE TRAPS.

AT Wolford Fields, near Shipston-on-Stour, the police have measured half a mile of road for the trapping of motorists.

THERE was a police trap at the end of last week on the Portsmouth road from the Royal Huts Hotel at Haslemere for 176 yards south.

THERE is a measured quarter of a mile on the Portsmouth Road, from the Anchor Hotel, Liphook, to the signpost leading to the station on the road to Petersfield.

FROM a correspondent in the Potteries we learn that police traps have been established at Newcastle-under-Lyme, Stoke-on-Trent, and other leading towns. In fact, it would appear as though the police in all these places were co-operating in their antipathy to motorists.

THE Motor-Car Journal.

VOL. V.]

LONDON, SATURDAY, SEPTEMBER 26, 1903.

[No. 238]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE Motor Volunteer Corps assembled on Saturday the 12th inst. at the Ailesbury Arms Hotel, Marlborough, which was their headquarters during the manoeuvres, the following officers being present:—Lieut.-Col. Mayhew (commanding officer of the Corps); Majors Knox, Eden, Stamford and Wyndham; Captains Goff, Crampton, Polden,

Ker-Seymour, Midgeley, Lee, M.P., Hearne, Hammond, and the Hon. C. S. Rolls; Lieutenants Trippel, Paynter, Holder, and the Hon. A. V. Cave; and Adjutant Captain Skeffington-Smyth, D.S.O. Officers and members messed together at 8 p.m., when the commanding officer gave an outline of the duties that they would be called upon to perform. On Sunday morning there was a foot parade of the corps with subsequent inspection by the Commanding Officer. Orders for the day were then announced by the Adjutant, and duties entered upon forthwith. It is interesting to note that certain repairs requiring to be done to one of the Commander-in-Chief's W.O. cars, Captain Rolls left Marlborough at 10.40 a.m., reaching Birmingham at 2.30 p.m., and after procuring the requisite material left again at 3.55, reaching Marlborough at 7.55 p.m. The repair was then completed and the car made ready for use by 10.15 p.m.

Some of the Work.

ON Monday extensive orders were issued and the following officers and men were detailed for special duties in connection with the headquarters camp. Colonel R. C. Knox, Captains Goff, the Hon. C. S. Rolls, Key-Seymour, Messrs. G. S. Foote and A. S. Gilbert. The following officers and men conveyed the foreign military attachés over various parts of the manoeuvre area: Captain A. B. Hearne, Lieutenants H. F. Trippel, the Hon. A. V. Cave, Messrs. C. A. Knight, Hippisley, L. Bury, W. H. Bloomfield, and F. Butler. Tuesday was an exceedingly busy day. Duties commenced at 6.45 a.m. Lieut.-Col. Mayhew conveyed the Commander-in-Chief to Shefford, beyond Hungerford, and was accompanied by Major Forbes Eden, Capt. Lee, M.P., Lieut. T. Holder, Earl Russell and members. Similar duties were performed by Col. R. C. Knox, Capt. the Hon. C. S. Rolls, Capt. Goff, Capt. V. Ker-Seymour and members. The following officers and men conveyed the foreign military attachés to Shefford, Newbury and Hungerford. Major Wyndham, Capt. Hearn, Capt. Hammond, Lieut. Trippel, Lieut. the Hon. A. V. Cave, Lieut. Paynter, and members. The detachment of the M.V.C. working with the umpire camp consisted of Major Stanford, Capt. Polden, Mr. Stanton and three cycle members.

Police Traps Down Hill.

THERE really seems no limit to the ingenuity of the police in devising their traps for motorists, and not satisfied with laying these on the level road, we find they are now signalling from points on the down grade of fairly steep hills. This is the sort of thing which was never contemplated by the

Local Government Board when restricting the legal limit to twelve miles an hour. It is such matters as this which give motorists so little confidence in the police system and makes us suspicious of the judicial Bench of the country.

Train v. Motor-Car.

MR. J. E. STEAD, a Middlesbrough civil engineer, was with his wife and children being driven on his motor-car from Darlington on Monday, and they were just about to run through a level-crossing when a goods train came dashing through the gates, splintering them to matchwood. The car was going at such a speed and was so close to the gates that it was impossible to avoid going on. The chauffeur adopted the daring expedient of turning the car on to the track in front of the train. Straining every nerve the driver extracted from his motor all the speed of which it was capable. The engine-driver, who did not appear to have noticed the motor-car, now realised the peril of the motorists, shut off steam and put on the brakes. Notwithstanding the efforts of both, the engine eventually ran into the motor-car, but as the speed of the former was by that time slackening, the impact resulted in nothing more serious than a severe shaking.

The Emission of Steam.

SEVERAL cases have lately been before the courts with regard to the emission of steam, and we commend to the notice of motorists that heard at Farnham, which will be reported in our columns next week, in which Mr. Douglas Mackenzie, the managing director of the Motor Transport Company, secured the dismissal of a summons against one of his drivers for emitting steam. The whole trouble seems to arise from some confusion among the police as to what comes under the Act of 1865, and what vehicles should be rightly regarded as dealt with by the Act of 1896. In connection with this, we notice that the Bench, while dismissing the case, proposed that the defendant company should pay the costs. This was subsequently remitted on Mr. Mackenzie pointing out the illegality of such a course, and we should suggest that this case should be borne in mind by others similarly placed.

Street Traffic Problems.

It was perhaps unfortunate that Section G of the British Association did not adjourn for a short luncheon interval ere Col. Crompton read his "Street Traffic Problems," of which we gave an extract in our last issue, for when the author mounted the platform there were but very few listeners. The discussion was brief, indeed the only part of any real value were the remarks made by the head constable of Liverpool. The chairman of the section, Mr. C. Hawksley, had something to say about lamp-posts and tramway standards, which, when placed in the middle of the road, obstructed traffic. He considered that omnibuses at present seemed to rule the speed of city traffic. The Head Constable of Liverpool, after referring to the powers possessed by the police in dealing with the traffic, said that in Liverpool they had a very busy electric tram traffic, and they had definite stopping places, which meant that a crowd of people collected at these points waiting for the trams to come;

they then rushed across the footways to their own danger and were also a hindrance to other traffic. That was a matter that would have to be considered some time or other, as it made a road practically a railway at certain points. He considered that the faster street traffic travelled, the safer it was. They had that experience in Liverpool. The number of accidents had considerably decreased since the introduction of the electric trams, though they had twice as many vehicles. The electric tram had educated all classes of the public to exercise greater care on the highways.

The German Attaches at the British Military Manœuvres.

Photo by

[J. T. Newman.]

Motors and Manœuvres.

At the luncheon which preceded the Reliability Trials, Mr. Roger Wallaco made the interesting announcement that Lord Roberts had confided his conviction that motorists were becoming increasingly useful in army work. This, too, is the view of the various *attachés* who were present at the manœuvres, and who themselves used motor-cars in connection with their observations. We are able to give a photograph showing the German officers engaged in the manœuvres, thus demonstrating the universality of the automobile. The Commander-in-Chief has just made his first annual inspection of the Motor Volunteer Corps, there being thirty-five motor-cars and nineteen motor-cycles present. At the conclusion of the inspection, Lord Roberts testified to the fact that he would have been in a very difficult position in the manœuvres had he not had the advantage of Colonel Mayhew's skill and speed of driving about everywhere in a most delightful and comfortable manner. He hoped that as time went on the difficulties concerned with punctures would be minimised, so that more reliability could be assured of the cars, and in this, of course, everyone will agree with the Commander-in-Chief. It has been amply demonstrated that the motor-car will become an essential feature in the equipment of the army, although, as is pointed out in one of the descriptions of the run to Worthing on Monday last, the raising of dust by cars would be a considerable assistance to an enemy in locating the presence of opposing forces.

How not to do it.

Others have lately appeared at local courts for alleged reckless

driving, and the names of a good many military men have appeared in our list of furious driving cases. Whether they are doing this with a view to making themselves more valuable to the country in times of war we do not know, but certain it is that the position of firms supplying automobiles to the army is not wholly an enviable one. The young men who are sent from the war authorities to inspect cars for purchase, and to be trained in their driving, do not always have any sense of their responsibilities, and very often regard lamp-posts and other impediments of the streets as legitimate targets for their waywardness. Expenses thus incurred are generally credited to the manufacturer rather than to the nation, with the result that we are afraid a good many firms in the motor industry are not keen on obtaining military orders. This is a small matter, but it is of many such small matters that the incompetence of many of our national offices is made up.

Warning Motorists.

RECENTLY we have received several letters from readers asking their position so far as the police are concerned, should they warn motorists of traps laid on the road. Not only in the south, but also in the north of England, the police are naturally very much annoyed when motorists, who have discovered examples of their mean methods of capture, travel some miles in order to warn other unoffending motorists not to incur the displeasure of the police. For this they should really be grateful instead of angry. A case was decided a little while ago in the north of England, and lately in Surrey, when motorists were summoned for furious driving, and the police urged, in order to secure a heavier fine, that they had been assisting other motorists to escape. So far as we know, this is the only danger that lurks in the practice, but we shall be glad to hear from any of our legal readers on the point.

Another American Monstrosity.

THE new Baker electric racing car which is known as the "Torpedo Kid" has been no more fortunate than its 1902 predecessor, for an accident occurred on its first public appearance at the race meeting at Cleveland, U.S.A., on the 5th inst. While it was defeated in the one-mile event for electric cars by a Waverley, it showed itself the fastest 800 pound machine in any class and also succeeded in lowering the

The Baker "Torpedo Kid."

five-mile record for electric vehicles from 8 min. 40 secs. to 6 min. 29 3-5 secs. The accident occurred in the last lap of a five-mile race. There were but three starters—D. Chisholm, in the "Torpedo Kid"; W. Baker, in a Baker runabout, and E. W. Gilbert, in a Waverley. The latter had just passed the Torpedo, when the spectators heard a slight crash and

saw the vehicle swerving and dashing apparently almost at right angles into the crowd along the fence at the track side. Hundreds of people left the stands and railings and rushed to the scene, expecting to find many dead and injured. But seemingly by a miracle only four persons were struck by the car in its erratic flight. Two were merely bruised. One man had his hip injured and his head badly hurt, while another was knocked unconscious, but later it was found that he was not injured and suffered only from the shock. The driver himself escaped uninjured, passing under the fence without touching it. As for the vehicle itself, two wheels were broken off and the shell was injured, but the mechanism was not broken. It is said that the accident was caused by the left rear wheel of the Waverley striking the front right wheel of the Torpedo in passing.

Motor-'Buses Wanted.

EVERY week brings news of new developments in connection with the use of automobiles for public service. Now resolutions are to hand from local authorities, asking for the provision of motor-'bus services, and also for the establishment of motor vehicles for the conveyance of goods traffic. The establishment of a motor-'bus service between Beverley and

tral authorities, under the 16ft. clause that roads should be closed to motorists, and it would appear that we shall have another great fight ere long with the local authorities, whom at one time it was thought had been thoroughly converted to automobilism by the propaganda of the Automobile Club.

The Southport Trials.

ENTRIES for the speed trials at Southport are being received in goodly numbers, and the fact that the last day for receiving entries has been postponed to Tuesday next will permit of others. Entries must be made on forms obtainable from the Automobile Club in London or the Liverpool Self-Propelled Traffic Association. The trials will be held on the 2nd and 3rd prox., the local consultative committee comprising Messrs. T. S. Vernon, L. Williamson, and G. Higginbottom (representing the Liverpool Self-Propelled Traffic Association) Mr. T. Scarisbrick (the Mayor), Councillor Trounson (the deputy-mayor), and Alderman Griffiths (on behalf of the Southport Town Council), Mr. J. H. Smith (Manchester A.C.), Mr. P. H. Altham (Burnley A.C.), and Mr. G. D. Wandsworth (North-east Lancashire A.C.). In the motor-cycle section there will be four events.

The Paris-Madrid Tour—The Ader Car at Riom, France.

[Le Chauffeur.]

Beeford, described and illustrated in recent issues of the *Journal*, has led the Driffield District Council to give serious attention to the matter, and they are now asking the North-Eastern Railway Co. to introduce a service of motor-'buses between that town and the villages of Wansford, Frodingham, and Beeford. The hamlets now served by the Beverley to Beeford vehicles have long been in the habit of making Driffield their market town. The trade of that place may be diverted; hence the interest of the local councillors to see the establishment of a motor-'bus service within their area.

The Speed Limit.

THE Roads and Public Grounds Committee of the Local Authority for Aldershot have informed the Hampshire County Council that it is, in their view, desirable that on all roads and streets in the Urban District of Aldershot, with the exception of the Farnborough and Fleet main roads, the speed of motor-cars should not exceed ten miles an hour, and this recommendation has been approved by the District Council. Already we notice the local authorities are suggesting to the cen-

All the races in the car section will be run over a kilometre course from a flying start, and the programme will include a dozen competitions.

Technical Education.

THE Technical Institutes are beginning to recognise the necessity of including motor-car engineering in their curriculum, and, at the Battersea Polytechnic, Mr. H. Taylor is conducting a class intended to train motor-car engineers and drivers, and to provide such instruction as is necessary for an intelligent understanding of the principles, construction and working of motors. Towards the end of the Course, students will be given the opportunity of examining and handling a motor-car, and the practical knowledge of the instructor, Mr. Taylor, should secure the usefulness of the class. At West Ham Technical Institute, too, we understand, Mr. John Duncan is giving attention to motor-car work in the engineering section for which he is responsible. We shall be glad to hear from similar institutes giving attention to motor-car instruction.

The Reliability Trials.

Photo by

The Dust Trials on the Track at the Crystal Palace.

Russell and Sons.

THE fifth series of Trials organised by the Automobile Club of Great Britain and Ireland opened on Friday last and will continue till to-day (Saturday), when the run will be to Brighton and back. Good weather has prevailed throughout, the organisation has proved to be fully equal to anything yet done under the auspices of the Club, and the percentages of cars doing well has been greater than on any previous occasion. We have already given particulars of the idea underlying the Trials, and of the most conspicuous entries. We now proceed to record the impressions of some who have accompanied the cars on their daily trips.

FRIDAY—TO MARGATE.

IN KENTISH HOPLANDS.

As we looked from the window of the Queen's Hotel, Norwood, on the morning of the 18th, the ruddy glare of the morning sun gave promise that summer had come at last; that the fickleness of the weather had been overcome, and that the rain clouds were to be evaporated into nothingness. As events proved a sky-struggle progressed all day, in which King Sol held his own until long after lighting-up time, when Jupiter Pluvius worsted him in the contest, and the rain fell in the way to which we have become accustomed.

But the morning opened well, and hopes were rising as the Crystal Palace Parade was reached. A strange odour pervaded the air, and a darkened hue was noticeable on the roadway. An enemy to dust had been abroad, and not only laid it low, but did it so effectually that it could not rise again. Car after car made fresh tracks along the surface; horses' hoofs made deeper impressions than did tyres; traction engines ploughed heavily along; the wind blew in swift currents across the roadway and sent the leaves hurtling with the speed of Gabriel; but the dust rose not, and Westrumite added to its reputation. Oh! for a length of Westrumite roadway along the Ripley course when winds are swift and dust is thick!

On the left of the roadway was a modern building, lacking the form and substance of the ancient structures of our forefathers. Ingeniously constructed of whitewashers' trestles and canvas was a tent, a kind of conglomerate of a War Office tent, an Indian wigwam, and a travelling theatre. Huge letters P. R. on one side caused us to think it was a Pratt's motor spirit supply store. E. S. S. on the side facing the Palace denoted the initials of Mr. E. Shrapnell Smith. Coupling the two letterings was the word Press—the meaning actually sought to

be conveyed. The building was evidently not intended to be a "thing of beauty," but as a means of utility it looked well, and Mr. Smith is to be congratulated on the thoroughness with which he has carried out the duties of hon. Press Secretary, displaying an urbanity of manner, a penchant for organisation, and a memory for details that found full scope for the questioning Pressmen who have sought him for knowledge on every point, from the gradient of Westerham Hill to the relative importance of petrol and steam in making a Locomobile travel along the road.

By seven o'clock the cars began to take up their places according to the numbers allotted. These had been decided by ballot, and the fortune of chance had given to Mr. D. M. Weigel the honour of pilot, which Mr. Chas. Jarrott carried out with so much zeal last year. A successor to Theodore Hook had been at work the previous evening rearranging the numbers nailed to the boarding of the Palace grounds, and the officials were almost frantic when the folly was discovered. But they postponed their fury to see that the joke did not mislead the competitors, and in a few minutes all was well.

Mr. D. M. Weigel on his Clement took up the premier position along the Crystal Palace Parade, and at 7.30 p.m. started off at the head of a procession of 104 cars that went off at intervals of twenty seconds.

On No. 68 we took a seat, and that car took its position—thirtieth in the line of procession. It was a Brooke of 14-h.p., with some new features, of which more anon. Mr. Mawdsley Brooke was at the wheel, and Mr. J. B. Reid our Observer—a lynx-eyed man who had studied his duties and knew exactly what to do and how to do it. Last year the Observers were a strange collection of motorists, engineers, and the holiday-making public. Efforts have been made to reduce the number of the latter taking part in the trials, and the Observers this year have been generally a great improvement on those who were said to observe last year. This is a fact upon which the competitors and public alike are to be congratulated.

We were soon on the way to Beckenham, postmen and milkmen being the only spectators, regarding us as abnormal persons to be stared at or glared at, according to the temperament of the onlooker. In front was the little Elswick car; behind the Chenard and Walcker, with the designer at the helm, and making far more noise than is ordinarily associated with this good type of car. At Beckenham, the newspaper placards announced the resignation of politicians, and many of the passengers by the cars wanted to get out and see the papers. But Observers were obdurate; knowledge was a good thing,

but not to be obtained by the breakage of rules and regulations. And so we conjectured.

Through Bromley shortly after eight o'clock, and everyone was struck with the green hues that predominated. Nature's copious and tearful outpouring of late had preserved the almost springlike hues of the trees and hedges, and until the long pro-

There was little to notice to while away the time; the road was familiar to all who had been to Folkestone in 1902, and it was with a sigh of relief that we noticed a donkey standing in the roadway and looking towards us. Experience in Ireland had led us to anticipate some fun, for those animals had such a delightful spirit of contrariness that gave zest to any meeting

The Start for Margate.

[Argent Archer.

cession of cars coated the vegetation by the roadside with a khaki layer, this was the dominant note of the hedgerows. But motor-cars can effect transformation scenes in the countryside, and many have been the changes made this week. A horse trainer had brought several horses out for training purposes, and then, as we got beyond Chislehurst, we passed the Elswick car on the hill, along which it had gone somewhat laboriously, especially when only a little bit off the top. Turning round when

with their tribe. But the ass we saw was an English ass, and, with all the politeness imaginable, he got out of the way of the Brooke, only to meet the Swift coming along. The way in which he reversed to that car was—to use a word that is employed for want of a better—immense, and the watchful driver of the Swift missed his donkey.

Being on a good car, and so near the head of the procession, there was little of incident and few cars to pass. Near the

Photo by]

The Run to Margate—The Scene at Maldstone.

[Campbell & Gray.

again on the flat, the Chenard-Walcker was observed, evidently slowing down, although it had taken the hill in capital form. Just before reaching Foots Cray adjustments were being made to the 6-h.p. De Dion Bouton, and then we went ahead, passing a couple of New Orleans cars which were of the number that made non-stop runs.

delightful old-world corner of Kent at Wrotham we passed the 18-h.p. Mors, and contemplated how this beautiful district could be closed by the Local Government Board to the motorists of 1904.

Beyond Wrotham, the first of the oast houses came in view, and we were soon in Hopland. The 12-h.p. Wilson

and Pilcher had stopped in consequence of a nut on the commutator cam going adrift, with the result that it retired from the day's run. Pending such a determination the passengers went a-blackberrying. Tyre troubles were frequent, the Relyante, the Elswick, a Georges Richard, a Mors, an Oldsmobile, and a Dechamps all wondering why the fiend associated with punctures

A Wayside Incident

should have selected them for his own. Fortunately, the car on which we rode escaped; tyre repairs and the time they take have no attraction for us.

In Maidstone we were drawn up in the main street, and presented a very begrimed appearance. The town is not an attractive one, and none cared to dawdle. It was noted that a few of the residents in the suburbs of the town had been wise in their day and generation, and had themselves thrown water down on the roadway for a distance of quite a hundred yards, thus securing comparative immunity from dust. We got out by way of Detling to Sittingbourne, along the straight, clear street of which we scampered gaily. A few knots of people with nothing better to do watched the cars, but there was a lack of that enthusiasm with which such trials were greeted in the old days—the old days of not so long ago. At Greenstreet the chase became exciting, for there were quite a score of cars—mostly big ones—in Indian file, to say nothing of a free-lance Daimler and a M.M.C. equally out of control of all rules and regulations. Going through the town motorists were compelled to eat their dust. It seemed to constitute the very atmosphere we breathed, and although the sport of scuttling along in a trusty car at a rattling speed was exhilarating, it proved a wee bit irritating when accompanied with clouds of dust, a chalky dust that whitened our clothes and transformed our appearance to an uninviting degree.

As we passed the hopfields the women left the bines and gathered on the roadside, while their bronzed and saucy youngsters pelted the cars with remarks that scarcely ever bordered on the polite. Drivers were invited to "Come out of that yere 'at," and "Git yer face washed" was an injunction all would gladly have responded to. These are the most printable samples of the conversation of the young hoppers; the rest may be imagined. Just beyond Faversham a car was seen in the distance behind. While we were gazing in vain for the number the outer cover was cut, and the inner tube blew out, swelling up like a football and revolving with each turn of the wheel—a remarkable excrescence that caused the car to stop and the passengers to recognise the value of the handy man when motoring. Harbledon was a picturesque place just before we reached the ancient city of Canterbury. The tower of the cathedral stood out grand and grey above the roof-tops, falling out of sight as we rounded St. Dunstan's Church and smelt the smell of brewing. Past some

good old houses we sped into Pound Lane—a narrow lane beginning with the police station and ending amid associations more friendly to motorists. In front were seen the 18-h.p. Star and 12-h.p. New Orleans, and we were soon beyond the barracks and feeling the cool breezes that were coming along. There was nothing of incident save the rumour as to a police trap that evidently did not exist, and the Brooke made a good pace through Birchington and Westgate to Cecil Square, Margate, where a goodly number of cars were already lined up, the multitude of automobiles being increased by the presence of several private cars, including Mr. C. Cordingley's 40-h.p. Mercedes. Such scenes are familiar enough nowadays, and as they appeared from the tonneau of our car may be seen from the accompanying photograph.

The White Hart was the official rendezvous for luncheon, and there men were rubbing and brushing and scraping the accumulations of Kentish soil with which they had been partially disguised. Just before 2 p.m. we left the Londoner's seaside resort, and were soon making for home, our car sustaining its reputation for comfort for the passengers. So much so that one had opportunity for a rest, and after seeing half a dozen cars still making their way to Margate we slept as far as Sittingbourne. The car has been very much altered since we had a run on the first turned out at the works from Lowestoft to Yarmouth and back, and that running in the trial has a pressed steel frame, while the axles have been re-designed to allow the back springs to be spread out four inches more, thus securing that absence of vibration which enables sleep. Larger sprockets, too, are employed than in the original type, and there is an auxiliary tank in connection with the pressure-feed lubrication. But the old car is still capable of good work, and as a matter of fact the first vehicle ever made by the firm has been driven about 17,000 miles, and was used by Mr. A. Maconochie, M.P., in a political tour in Scotland a month ago. Like Tennyson's brook,

"Cars may come and cars may go,
But I go on for ever."

After the sleeper had been awakened, the return journey was but a repetition of the outward run, so far as the incidents of the road were concerned. A few gentlemen were evidently wisely taking advantage of the occasion to accustom their horses to motor-cars, and towards Canterbury several clergymen were observed as interested spectators. At Maidstone tea was the objective, and there one learned that No. 67, the Ariel, had had

In Cecil Square, Margate.

to return to the Palace, having bent its axle in avoiding a collision at Chislehurst. Trouble with the gear had caused the retirement of the Holcar at Wrotham, and a few minor incidents concluded the list of disasters. The run home was in good style, and of the 104 cars that started, 35, it was found, completed the whole 150½ miles—the longest day's run of the series—

without a stop; 26 did practically as well, thus establishing the reputation of 61; another 28 had delays involving the loss of more than five marks, but only eight retired—a fine record of a stern day's trial.

OUT OF CONTROL.

On the opening run of the Reliability Trials to Margate the writer arranged for the journey to be taken by a car that was not entered for the trials, and a seat on a 20-h.p. M.M.C. was placed at our disposal. Punctually to time, our car was in readiness, with a view of the vehicles as they filed past at the start. After fifty or sixty had proceeded on their way, we decided to follow on, and in a short time were speeding cautiously along, the milkmen and postmen for some time being the only observers. For the first few miles the cars were fairly close together, while the bright promise of daybreak was rapidly turning into an absolutely lovely day, and the occupants of cars were consequently in high spirits. Just this side of Chislehurst three "men in blue" were observed to enter a covered van and move in the direction of the town, but whether on evil bent or not did not transpire. By the time the summit of Wrotham Hill was reached many cars had been passed, and as our M.M.C. was not controlled by an Observer we decided to wait and see other cars climb the hill, which for some of the smaller-powered ones proved an arduous task. After a short stop we again

The Brake Trials in the Palace Grounds—The 20-h.p. Humber on the Line.
Photo by [Russell & Sons.]

proceeded on our way, soon passing a 12-h.p. Wilson and Pilcher, and, about a mile further on, an 18-h.p. Mors, both in trouble. At ten o'clock Maidstone was reached, and the congregation of cars quite monopolised the broad roadway, while the motorists were beginning to show a fine powdering of dust. After a longer delay than the rules permitted for the "Reliability" cars, we went forward once more, duly reaching Sittingbourne, where the cars proceeded through the town in close procession at a slow pace. Both before and after passing this town many motor-wagons and traction-engines with trailers were observed in use for agricultural and other pursuits; while the crowds of children belonging to the hop-pickers were loud in their observations as the long procession passed by, and when they return to their homes again they will have to tell of the motor-car "race" they were fully convinced was taking place. Faversham and Canterbury were duly passed, then on through the sweet little village of Sturry, and soon afterwards we were made aware of the approach to the seaside by meeting a number of two and four-horse pleasure vehicles, the occupants favouring the motorists with a good deal of chaff on their appearance, which was certainly warranted, as the dust from Maidstone onwards was simply a cloud, from which there was no escape, and in the result both cars and occupants presented a very dirty appearance. Between Birchington and Westgate-on-Sea a motor-cyclist was

kept busy giving information to motorists of a police trap ahead, but, thanks to the timely hint, a good "bag" did not result. Onwards into Margate crowds of varying sizes were passed, while in Queen Street and Cecil Square great interest was exhibited. The motorists, however, were first concerned in reducing the coating of dust and securing their lunch.

Soon after two o'clock the return journey was commenced, and in the first ten miles five or six cars were met on their way in to Margate, so the hour must have been very late when they returned to the Palace. The return journey was quite without incident. Many cars were passed; the 20-h.p. Motor Manufacturing car, with Mr. J. A. Prestwich at the helm, completed the entire journey without any trouble, tyre or otherwise. It proved a splendid hill-climber, and ran smoothly. Not a single horse showed fright during the day, while both on the outward and return journeys a trap was met being driven by two spirited horses tandem fashion, and no sign of fear was exhibited. The Palace was reached just before seven o'clock, after a most enjoyable day's run by the M.M.C. car, which was not in control.

SATURDAY—TO EASTBOURNE.

A DAY ON THE HILLS.

ACCORDING to arrangement, our "mount" for the run to Eastbourne on Saturday was the 12-h.p. Gladiator driven by Miss Dorothy Levitt. Overnight we had been pondering over the coming novel experience of a long drive with a lady at the wheel, and were early on the scene for the fray, if fray it were to be. The starting number for the car was 77, and as it took up its position we saw, to our dismay, that it was already provided with a full load of passengers, so that if we were to go on the car the new experience would be added to by a long ride on the floor of the front seat—not a pleasant position to occupy for a spin of 121 miles. However, on enquiry it was found that a mistake had been made, and that the fourth seat was intended for the representative of the *Journal*, who accordingly took up his position in the tonneau. At the appointed time all was ready for the journey, the car having its full complement of four passengers, or rather, in this case, five, to wit—Miss Levitt and the little dog which accompanies her on all occasions, Mr. Robertson, of the Ryknield Engine Co., acting as Observer the writer, and the mechanic. Motor-cars in front of us and motor-cars behind us, we gradually worked our way to the starting point, and at 7.56 were given the word "go" by Mr. Siddeley. And "go" we did without any hesitation amidst a busy throng of "camera fiends," the car driven by a lady being the object of so many snapshotists as to almost make the male passengers blush. Down the hill we went and soon were in Penge, which was beginning to show signs of life, and where we had our first and only serious piece of excitement of the day. It is Burns who is responsible for the phrase that "a man's a man for a' that;" he might have added that though ladies may drive motor-cars or go up in balloons "a woman's a woman for a' that." True the experience we went through was a trying one, even for those of the male persuasion, for it is not often that a motorist has the misfortune to run over two dogs at one and the same time, as did Mr. Pullinger on the 12-h.p. Sunbeam (No. 65) which immediately preceded us. For a second or so the situation was critical, but, although considerably upset by the incident, Miss Levitt pulled herself together and soon we were sailing along as if nothing had happened to mar our trip. The Elswick (No. 19) was seen to be stopped as we made for West Wickham, near which place we overhauled the 8-h.p. Achilles (No. 23), which, however, was going steadily along. Climbing the hill on to Hayes Common, we were "observed" not only by a policeman, but also by Messrs. Beaumont, Crompton, and Lyons Sampson, who apparently were watching the behaviour of the cars on this ascent.

Nothing seemed to keep the Gladiator back except the instructions of the Observer, and in this respect we had so far been more fortunate than the 6-h.p. Swift (No. 24) which was stopped at Keston, and the 6-h.p. Regal, which had met with a tyre puncture at Lock's Bottom. During the

previous night there had been a little rain, but not sufficient to lay the dust, which now began to make itself felt, and more painfully so as the day wore on. Green Street Green, where Arnott, who is this year driving a car, met with a nasty fall twelve months ago from his Werner motor-bicycle, owing to an ill-behaved dog, next came in sight minus dogs, but with the Winton (No. 104) having a temporary stop. "Doctor" Cranham on the 10-h.p. Horbick (No. 56) begged by means of his hooter

ere this little town was reached we had seen both the 10-h.p. Dechamps (No. 60) and the 12-h.p. Darracq (No. 64) in a state of rest. Like a number of others we crawled, to fill up time, into Tonbridge at 9.33, and met with a rousing reception, directed, not at the passengers, but at the lady at the wheel. Southborough and High Broom were soon left behind, and at 9.58 a.m. we came to a stop in front of the Common, at Tunbridge Wells, for the 15 minutes' interval allowed by the rules.

Ready for the Run to Eastbourne.

[Argent Archer.

to be allowed to pass, but he did not leave us for long. Approaching Riverhead, the 10-h.p. Wolseley (No. 52) was passed, a punctured tyre having brought it to a stand. The enjoyment of the run down this hill was spoiled by the clouds of dust, and shortly we were on the steep climb into the old town of Sevenoaks, where Mr. Dew on the Gardner-Serpollet (No. 105) gave us a practical demonstration of the hill-climbing capacity of steam cars by sprinting in front of us on the steep portion. It was 9.7 a.m. as we ran through Sevenoaks High Street, and, passing a party of "hoppers," made our way towards

The quarter of an hour soon came to an end, and once more we were under way, only to see a car, whose number we could not ascertain, being pushed up the hill leading out of the town. Little notice of this was, however, taken by those on No. 66, as by a kind of premonition it was felt that "a bad time" was in store for the Gladiator. For some miles our car did not run up to its usual mark, a fact, even had we not noted it ourselves, that could easily be discovered by a glance at our mechanic's face. To the uninitiated this may always be taken as an excellent guide, for any miss-fire, unusual rattle, or missing of the gear, is as gall to a mechanic, whose

the famous River Hill, the descent of which we achieved without any untoward incident. Not so, however, the 6½-h.p. Cadillac (No. 14) which we passed on the roadside at the foot, with a broken road wheel, the result, as we afterwards learned, of a collision. The dust-allaying qualities of "Westrumite" were again demonstrated as we quickly passed over the half-mile of road which had been sprinkled with the new solution. The next stage was to Hildenborough, and

[Argent Archer.

life and soul, if he be at all worthy of the name, is centred in the car. Shortly after starting from Tunbridge Wells we began to leave a thin trail of water in the dust behind us. Sufficient in itself to cause forebodings, the outlook was not brightened by Miss Levitt announcing that only three of the four cylinders were working. As the thin line of water still continued to mark the way we had come, a conference was called and a decision to stop to put matters right arrived at. This occurred near Mark

Cross, and while the mechanic attended to the water-leaking difficulty, our lady driver busied herself with the ignition. The cause of our undoing was the fracture of the pipe conveying grease to the water-circulating pump, and to two broken sparking plugs. Fortunately the "spares" box was sufficient for all eventualities, and after a delay of twenty-one minutes we were again *en route* with a fresh charge of water to make up for that we had lost, and a new accumulator in circuit.

At Hellingly our progress was stopped by a herd of cows which set off at a trot in front of us. The man in charge of the cows was absolutely helpless, and comparisons between him and his dog were decidedly in favour of the dumb animal, whose intelligent endeavours to get the cows out of the way eventually proved successful. From Hailsham onwards through Polegate and Willingdon to the destination nothing occurred to disturb the even tenour of our way, and after passing through the

Snapshots during the Luncheon Hour at Eastbourne.

Mr. E. M. C. Instone.

Naturally during our stoppage car after car had gone by, and, having started seventy-seventh, it almost looked as if we would be among the last arrivals at Eastbourne. Anxious to make up for lost time, but deterred by the immovable orders of the Observer, we ran along fully up to schedule limit and soon found ourselves in the interesting old town of Mayfield, the way out of which is by a nasty curvy dip which it would not be pleasant to come upon suddenly in the dark. Through Cross-in-hand we

beautiful Terminus Road, and along the sea front, we pulled up at the Grand Hotel, Eastbourne, at 12.35.

The scene was, of course, a lively one; cars followed one, another in quick succession, proving that, notwithstanding our delay *en route*, we were by no means the last to arrive. Instead of the 45 minutes' rush for lunch the order had wisely gone forth that no car was to restart before 1.30, so full justice was done to the satisfactory spread in

Some of the Cars Outside the Grand Hotel, Eastbourne.

[Argent Archer.

went in good style only to find ourselves "held up" at Culverwood by a brother pressman who was stranded owing to an accident to the 14-h.p. Beaufort (No. 78.) He asked for a seat, but this being impossible, we gave him sandwiches so as not to appear unkind. Horeham proved less agreeable to the Elswick (No. 75), and the Maudslay (No. 128), than to us, for both were stopped at this place, while the 10-h.p. Thornycroft (No. 70), had to replace a valve within a few miles of the little town.

the hotel. Feeling refreshed, we started on the return journey at 1.35, the cars proceeding in one long *queue* through the town and along the familiar route to Willingdon and Polegate, the great drawback to the cavalcade being the long, continuous, choking cloud of dust it raised. At Willingdon, the 12-h.p. Krupkar (No. 54) was met still on its way to Eastbourne, while the Winton (No. 104) was still on its outward journey as we neared Hailsham. As far as Lower Horsebridge the route

was the same as that covered in the morning, but there we turned to the left and enjoyed a speedy straight run for several miles, the dust bogey not being so much in evidence, as by this time the procession had been considerably broken up. Somehow or other our car appeared to know that it was on its way home, for it pulled well and it would seem that the speed allowances were rather more liberal on the second half of the journey, for, in spite of the faster pace, our Observer reported at the different stages that we had occupied the requisite time. There had been rumours of police traps at East Hoathly and Uckfield, but although a careful watch was kept no police did we see nor yet their traps. At Uckfield we struck the hilly country and the breeze, being followed by Mr. Joe Lisle on the 10-h.p. Star (No. 77), which seemed to be travelling along in good style. Near Maresfield the 15-h.p. Pipe (No. 129) and the 18-h.p. Star (No. 99) were passed on the roadside, after which the long steady climb of several miles up Blackham Common was commenced. The hill tried the capabilities of the vehicles to the utmost, and although the 18-h.p. James and Browne (No. 100) passed us, we went up at a good pace and enjoyed a beautiful view from the top of the Common. Soon we were descending to a lower level and running through Hartfield and Edenbridge, only to be followed by another stiff pull up Crockham Hill. Slowly, but surely, we ascended, and all breathed a sigh of relief when the top was reached. A few minutes more and we were in Westerham, to which we had to turn to the right and not to the left as the road book states. A

Profile of Betsom's Hill, Westerham.

welcome rest of fifteen minutes was here enjoyed, the village being alive with motor-cars and motorists.

Between us and the Palace was the stiff climb up Westerham or Betsom's Hill, the average of which is about one in ten, with a piece one in eight. The times were taken with a flying start, but the results will probably not reflect the true capabilities of the cars, owing to the unusual conditions under which the ascent was made. Throughout its whole length both sides of the road were lined with people, cars, and cyclists, but very little space being left for the competitors to make their way. In fact, never have we seen the hill so crowded as on Saturday, when there must have been close on 200 automobiles lined up. Our car, with its lady driver, came in for unusual attention as we started on the ascent, which was taken in good style until near the top, when, owing mainly to the excitement, a *faux pas* was made which brought us to a stand. Miss Levitt, however, was not to be beaten, and on the stiffest part got the car in motion again, and amid the plaudits of the spectators, scaled the summit. Steadily we forged along on the last stage of the journey, which had, however, still more incidents in store for us, for on the bridge at Clock House Station, practically within sight of the Palace, we came to a stop. Grit in the carburettor, as a result of the dusty run home, was at first suspected as the cause of our stoppage, but which, on examination, proved to be the simple, and consequently more annoying one, of an empty petrol tank. A spare two gallons being on board, we were soon on our way

again. Somehow Penge seems to be unkind to Miss Levitt, for whilst in the morning a couple of dogs nearly led to our undoing, it was an unattended horsethat, in the evening, suddenly decided to block our way. However, "All's well that ends well," and, this incident over, we finished our day's run in good style up the Crystal Palace Park Road in company with the 20-h.p. Beaufort (No. 121), and the 12-h.p. Wilson and Pilcher, Limited, (No. 123), arriving at the Palace at 5.33 p.m.

Thus we have added a new experience to our record—that of being driven by a lady a distance of 121 miles. If at first we were somewhat fearful of the prospect, the fear quickly wore away, for we recognised Miss Levitt's ability as a motorist; the way she drove the car, especially up the hills—and only those who have made the journey from Eastbourne to London over the route followed on Saturday have any idea of the number and steepness of the hills that have to be surmounted—is worthy of all praise.

Enquiries at the Press tent later in the evening resulted in ascertaining that ninety-three cars had started on the run to Eastbourne, and that of these twenty-three had accomplished non-stop runs, fifty had made the trip with trivial delays, the returns of five had not been analysed, four had retired, and eleven had not arrived by eight o'clock.

THE WESTERHAM HILL CLIMB.

The scene on Westerham Hill on Saturday afternoon was remarkable, car after car arriving with parties of motorists bent on witnessing the climbing capabilities of the competing vehicles, until the hill was so packed with spectators as to leave but very little room to get through. The cars were not stopped, as last year, but had their times taken as they passed over lines at the foot and at the top of the hill. The crowd undoubtedly interfered with the success of the test, as no room for passing was allowed, so that as cars came to a standstill, as many did, the way of others which were going up strongly was blocked, and were thus prevented from making a good record. At the time of writing the official results are not available, so that only a general impression as to the behaviour of the cars may be given. As will be seen from the profile, for which, as for those of Bury Hill and Hindhead, we are indebted to the official programme of the Trials, the hill has an average rise of 1 in 10, the worst part being 1 in 8. The first to climb, all at a very fair pace, were the 12-h.p. New Orleans, 14-h.p. Martini, 12-h.p. De Dion, 22-h.p. Daimler, 12-h.p. Clement, 10-h.p. Gardner-Serpollet, and 24-h.p. Wolseley, the last being the fastest on the steepest gradient. The stoppage of a car blocked the way of several others, but all got away again. The 20-h.p. M.M.C. went up with ease, followed by a group which had no difficulty in negotiating the ascent. Then came a series of failures, and at one time, at what is known as Hell Corner, were collected half a dozen cars struggling to get restarted again. Three cars, finding that the gradient was too severe for their forward gears, turned round and went up with ease backwards, to the amusement of the spectators.

MONDAY—TO WORTHING. ALL AMONG THE DUST CLOUDS.

Monday opened well and 86 cars started in the official procession to Worthing by way of Dorking with a hill-climbing competition up Bury Hill by way of variety. These daily runs become as monotonous as the fare at an A.B.C. shop, and any little diversion is welcome. To afford some change we gladly accepted Mr. E. M. C. Instone's invitation to occupy a seat on his 22-h.p. Daimler—a fine car not competing in the trials and therefore able to run at its own sweet and swift will. Mr. Instone drove—that was a sufficient assurance of reliability—and for good company there was Mr. A. Farnell, of Bradford, and Mr. Conrad Cooke, who, as consulting engineer, has visited Big Ben, and as an expert is participating in these trials with evident joyfulness.

It had been the intention to linger a little longer than the crowd of cars, and then to proceed along the line of vehicles as far as Dorking, enjoying the dust they raised on the way. This

was a kind of penance for the dust the 22-h.p. Daimler had unsettled on the run to Margate, and was merely an act of retribution intended to redeem the character of the Daimler in the eyes of its Friday's victims. But, alas for our sacrificing natures! We were asked to marshall the cars at the foot of Bury Hill, a piece of work that necessitated a good pace for fifty miles, disturbing any loose Mother Earth that was lying about and proving the advantages of the Free Lance as compared with the Regulation Number.

The number of starters was a tribute to the all-round improvement that has been made in the automobile world. There were the usual listless groups taking a careless interest in our passing through Sydenham and down the steep decline of South Norwood Hill to Selhurst. On through Croydon we went, crossing and blessing the tramlines to turn into the Waddon New Road. Passing by Beddington we tasted dust and passed the 6-h.p. Elswick going steadily and strongly. Nearer Wallington Mr. S. F. Edge was taking walking exercise, the familiar white dog—a sweet little creature—serving as a warning to any policeman who sought to question the Marshal as to the celerity of his movements. After leaving Carshalton we saw a succession of cars and wondered how they would behave in military manoeuvres. If smokeless powder is necessary for the concealment of forces, dustless cars would appear to be equally advisable. It was easy throughout the day to see the trail of the cars rising above the hedgerows for miles, and where the road was hilly and winding the dust clouds indicated to friend and foe alike the way the cars had gone.

Nearing Sutton, a Century tandem was pursuing an even course, the Observer sitting in solitary grandeur and seeking to maintain a dignity of expression ready to dissolve should any large boulder strike one or other of the wheels. Then the big Italian, the British 7½-h.p. Wolseley, the French Georges Richard, and the 12-h.p. Gladiator drew to the left to allow the free Daimler to go by, and an international hooting arose while Observers scowled. For these competitors do not like to be left behind—not only is it destructive of a lofty suspicion of superiority, but it means substantial tokens of regard in the form of solid soil—for inward as well as outward application. And it must be confessed we were ungallant enough to wave adieu to Miss Dorothy Levitt, whose Gladiator had to keep within the regulation bounds of speed. Quite a cluster of cars were met in Epsom. The 18-h.p. James and Browne was in sight, and a memory of last year's Trial arose, when, riding on a car that dodged between a James and Browne vehicle and a market trap, our motor got the worst of the encounter, and we were rewarded with bruises like medallions. But such impressions wear away, and everyone went peacefully along on Monday. Mr. E. H. Arnott handled the reins—we mean the wheel—of the other Gladiator, seemingly quite as much at home on a car as on a Werner motor-cycle, and certainly more comfortable. The three-cylindrical Argyl was next described, one of the stud from Scotland that shows how keenly the north of the Tweed is interested in the business. An 18-h.p. Mors, the 15-h.p. C.G.V., and a 9-h.p. Eagle were a trio journeying in company. Some of the passengers looked furious through their layers of dust as our horn sang out a cheery farewell. But Mr. Friswell did not relax his smile as he was left behind on his Peugeot, and Mr. Dennis on his car from Guildford recognised the fitness of things that he should adhere to conditions and not seek to burst into our pleasant speed.

So far the run had revealed no curiosity among Observers or drivers to see the stuff of which their vehicles was made, but just before reaching Ashted the temptation was too great for some, and peering ahead, Mr. Farnell—an Observer off duty for the day and apparently reconciled to the fate which had taken him from official leading strings to the guerilla methods of the unnumbered Daimler—fancied he saw a heap, amid the rising dust ahead. Coming closer it was seen that an inspection of the 20-h.p. Germain was being made. After that it was the same chronicle of everyone going well for the next few miles. Mr. Peckham drove his Winton and Mr. C. Jarrott was trundling his De Dietrich along as though road racing was

not in his line. But he has lately taken new cares unto himself, and must do less reckless things than smash his car and dislocate his collar-bone. Such incidents are matters of the past; he has driven very carefully in these trials. The two-cylindrical Argyl was next seen steadily marching after the Brooke, the driver nearly hidden amid the avalanches of dust with which he was assailed, but travelling well nevertheless.

The scenery now gave us new interests, for we went straight down hill into Leatherhead, just catching a glimpse of the picturesque church with its old-world lych gate as we sped by to Mickleham, where Mr. Burford was taking the judges along in legal style. Col. Crompton, Mr. Lyons Sampson and Mr. Worby Beaumont were keenly watching the performances of passing vehicles, and their observations should be a useful contribution to the literature of the industry. Mr. Overton on a Georges Richard, Mr. Frank Wellington on a Brooke, and Mr. Dew guiding a Gardner-Serpollet, were left behind, and just before Box Hill, with its glorious expanse of undulating landscape, we turned a sharp corner and rushed by a Pipe into Dorking—a quiet old town that makes little noise in the world nowadays, although at one time "The Battle of Dorking" was a feature of railway bookstalls.

A score or so of cars were already in line—their passengers nowhere to be seen. Evidently there were many charms

Profile of Bury Hill, near Arundel.

unapparent to the casual wayfarers like ourselves who went along, on duty bound and against inner considerations, to the Horsham road. At Holmwood, where we slackened speed to enjoy the prospect, the 20-h.p. Humber was seen making good progress. It was certainly a charming road, the old duck pond, the trees and hedges giving a charming embroidery to the landscape and causing many a pang when it was reflected that under the 16 ft. clause of the new Motor-Car Act such scenes would be possibly closed to those who love to learn of the picturesque pleasures of their native land. This grew upon us after Beare Green had been crossed, and observing the printed instructions as to "Seven Red Cottages all in a row," we turned to the right for Ockley. It was a gently undulating road, and, glad to see clearly ahead, we heeded not the sand fog we made behind. That was a matter for our successors to swallow.

Coming up with a Wolseley car, news of a police trap was borne upon our ears. It added to the zest and interest of the run, and we prepared for pictures. Stealthily a passenger from the Wolseley searched the hedge, and then, upon a piece of rising ground, he peered over. Hurrah! there was a hat, and underneath the hat a body. The watcher beckoned, but just as we were reaching the ground he came back with a look of dejection such as only the greatly disappointed wear. It was not a policeman but a gamekeeper, a most innocent man. He begged his pardon and we went along philosophising on the

The "James and Browne" leaves its Dust behind.
The "Serpolllet" Steam Car.

THE BURY HILL CLIMB.

suspicious nature of the human race. Mr. Instone's views on the topic would make a useful companion to Whateley's Logic.

Then for a switchback ride to Slinfold, up hump and down grade in rhythmical succession, with plenty of English soil ascending in clouds sufficient for any air ship to travel on in comfort and security. But we were not the only dust raisers on the road. For many hundred yards ahead the wind was lapping the dust and sending it circling into the air and competing with motor-cars in what the public regard as their monopoly. At Billinghamurst, part of the road was "up" in the most approved London fashion. The district was quite as pleasing as any we had come through, and a strange contrast to the extremity of the old Roman road that ran from Billinghamurst to Billingsgate, where the language comes from. The old Stane Street from Chichester to London crossed this parish, terminating near the famous fish market. Have we lost the art of road making? Certainly much might be learned from the Romans. Up Codmore Hill we descended into picturesque Pulborough, its Early English church being a striking feature of the landscape. In this old place, full of reminiscences of Roman occupation, is a garage—the word standing out prominently from the other bank of the Adur, which we crossed by a bridge and then went on our speedy way through Hardham and Waters-

Dechamps, the 15-h.p. Maudslay, and the 10-h.p. De Dietrich. These all took the hill in good steady style, and closely followed by the 10-h.p. White steam car, the 15-h.p. Pipe, the 16-h.p. Rochet Schneider, and the Gardner-Serpollet. Mr. Jarrott on his 24-h.p. De Dietrich and the 12-h.p. Albion came up practically together. The 12-h.p. Georges Richard was going slow and misfiring. The 5-h.p. Oldsmobile was moving somewhat wearily when the Fiat came along in really good style. The James and Browne passed the Hallamshire, and then we had the spectacle of the 10-h.p. Thornycroft being left behind by the Gladiator of similar horse-power. The 10-h.p. Eagle and the 20-h.p. Winton went up well, and then Mr. George Iden brought the 20-h.p. M.M.C. up the hill in sportsmanlike fashion, going strongly. The Dennis, a couple of Argylls, with Mr. A. Govan as a passenger in one, and a 10-h.p. Peugeot led the way for the Daimler brake, with ten passengers, and making little trouble of the task to be encountered. Two Wolseleys came in Indian file, with another military name, Mr. Wellington, succeeding. Mr. Thompson on his Achilles took the hill nicely, but was overshadowed by the good performance of Mr. Bush on the big Daimler. The 15-h.p. Germain was followed by Mr. W. H. Astell on his 12-h.p. New Orleans, the wind shield being a conspicuous feature of the vehicle as it ploughed along. Mr. J. Lisle drove the Star, his bowler hat

field to Bury. On the way we met Mr. J. F. Ochs on the Napier which we last saw when in an Irish bog. As we entered the dust cloud he raised, we almost wished—but more generous feelings prevailed—that a similar adventure would again befall him.

THE BURY HILL CLIMB.

Arrived at Bury, we found the cross roads so much used that a flying start down hill and crossing the line at the point originally selected was too risky, so, after a hurried consultation, it was decided to have a standing start. Mr. Instone remained at the bottom of the hill to marshal the vehicles; his trio of passengers went upwards. Messrs. H. Sturmev and H. J. Swindley were found at the red cart shed a little way up the hill, the time being taken from that point to another 1,320 yards further on. The total rise of the hill is 338 feet, the average gradient being 1 in 11.74, and the worst 1 in 10.8. Then the writer stationed himself to watch the ascent of the cars and snapshot a few. How they came along can best be judged from the official chronicle; but some impressions are of some interest if of little value. The first to make the ascent was a 6-h.p. De Dion, followed by the 16-h.p. Argyll, the 20-h.p. Humber, the 24-h.p. Georges Richard, the 20-h.p. Beaufort, the 15-h.p. Belsize, the 9-h.p. Argyll, and the 12-h.p. Relyante. Then came Mr. J. W. Stocks on the 12-h.p. De Dion, the 5-h.p. New Orleans, the 10-h.p.

giving him quite a halo, and showing a courage that was unique, for no other driver was so heterodox in headgear. The 7½-h.p. Wolseley proved itself a climber, as did also the Darracq and Rex in the same class. Mr. Dennis, Mr. Friswell on a 12-h.p. Peugeot, the C.G.V. the 10-h.p. White car, with Mr. Loxton Hunter as his Observer having his first ride on a steamer, the 12-h.p. Sunbeam, with water steaming hot, and Mr. J. Overton on a 10-h.p. Georges Richard were the next contingent of competitors, the line of succession being broken by Mr. Burford bringing Mr. Worby Beaumont along. Then came a Wolseley with the Clarkson steam omnibus in hot pursuit. The word hot is used advisedly, for the passengers appeared to be enjoying all the warmth of a tropical atmosphere. Miss Levitt brought her Gladiator along, and then came the Martini, the Simms Welbeck, and a Beaufort. An Oldsmobile came along very well, followed by the 16-h.p. Maxim, the 6½-h.p. Clyde also making good progress for its size. The 9-h.p. Darracq ascended in a wayward fashion, and was, of course, passed by the 20-h.p. Thornycroft. The 9-h.p. James and Browne seemed somewhat of a slow coach and was soon passed by the 18-h.p. Mors with five passengers. After the great car came the Baby Peugeot, an infant of good constitution and staying power, the 10-h.p. Spyker and the 10-h.p. Horbick in quick chase. The 8-h.p. M.M.C., the 10-h.p. Lanchester, the 14-h.p. Brooke, the 14-h.p. Brush and

9-h.p. Mohawk Manon, with the Humber in the rear, ended our interest, and an ascent on foot began. At the top of the hill the view of the country was amplified and the glorious landscape was worth the effort of walking and the feeling of hunger that rose with every foot of the road. The Rex Tricar, with the 10-h.p. car from the same works, and a 6-h.p. Swift diverted attention from the picturesque by coming well along with the 20-h.p. Germain in pursuit. There were a few others, but a raid on the Commissariat Department effectually dispelled interest. We heard, however, that the passengers on the Simms-Welbeck had been given walking exercise near the top of the hill, and the Century Tandem and the Regal had had momentary stops, resuming, however, and finishing in proper style.

After the hill climb the cars went on by official way to Worthing. We, scorning such restrictions, basked in the picturesque awhile and then went across country to meet the vehicles on their return way at Horsham. At the bottom of the hill the Cadillac was seen coming along. Away we scooted in good style and, in the absence of traffic, we gave a burst of speed—exhilarating, stimulating, and tempting enough to have pleased a Surrey J.P. One instance of a foolish signboard made us lose a mile or two—a matter of small concern to a Daimler with Mr. Instone at the helm. Instead of the finger boards being at different heights on the post, the three arms were on the same level, that directing the way to Horsham being immediately hidden by another, a piece of confusion which the local authorities should rectify without delay. At Horsham we found the judges at lunch and naturally followed so excellent an example. At half-past two the 20-h.p. Beaufort was the first arrival at Horsham, and then came sixty others in rapid succession. The drivers and passengers looked as though they had passed through ages of experiences. Black moustaches were coloured with the dust of the roads, fair men seemed grey with mother earth. I thought of Burns:—

“Oh wad some power the giftie gie us
To see oursel as ithers see us,”

and mentioned the lines to a Scotchman on an Argyll. He looked fierce, and, getting hold of his starting handle, merely said “You’re another,” for we, too, had been through miles of dust and were little better than the crowd.

But really the procession was a shocking one. What a mob of undesirables for a drawing room!

We were not long in leaving Horsham. To give the newspaper men a little incident—though only a very little one—a Sunbeam collided with a Thornycroft, or a Thornycroft collided with a Sunbeam. Anyhow, the latter came out of the encounter with nothing worse than a bent wing. Thence onwards, *via* Capel, to Dorking, we went at a good rattling pace, leaving behind delightful country and plenty of dust, through which succeeding cars could gallantly negotiate. On the way some interesting incidents were witnessed, as we swept by Captain Deasy on a car that travelled extremely well, and a score of others of lesser power. For a few minutes Mr. Iden was seen trying to get beyond the Chelmsford bus, but the vehicle did not take the straightest of courses and careful manoeuvring was necessary. Then we followed and scurried along in good style. Just before entering Capel the Belsize was seen in difficulties, and then we had a mile or two behind a noisy vehicle shod with solid tyres. Beyond Holmwood the judges were half hidden by bushes, observing from a position of supposed seclusion the performances of the vehicles from the rear. And then on through Dorking and Betchworth to Reigate, where lurking suspicion came over us and the police were less ubiquitous than elsewhere on the homeward run. Beyond Reigate we saw a quartette of crawlers—a 24-h.p. Wolseley, a 22-h.p. Daimler, a 15-h.p. C.G.V. and a 24-h.p. De Dietrich. They were evidently anxious not to take advantage of their smaller rivals—a sacrificing ordinance that also had the merit of preventing marks being deducted for excess of punctuality. The rest of the run was purely formal, and at five o’clock we saluted Marshal Edge at the Palace. However much we

hurried, he generally got there first; possibly he gained time by fasting while others lunch.

Of the cars that started in the morning thirty-four had absolutely non-stop runs; forty-two were delayed for a minute or two—and only two retired from the fray, one being the 15-h.p. Belsize, which broke its connecting rod at Kingsfold on the return journey.

TO WORTHING BY THE “MARTINI.”

When Captain Deasy offered us a seat on the 14-h.p. Martini car, we were pleased to find that the day chosen included a hill climb, as these cars being known in Switzerland, where they are manufactured, as “Mountain-climbers,” we concluded that the hills of Surrey and Sussex would be as child’s play to them. We started No. 88 at 7.45 with the full number of four. The weather was delightful, with rather a strong breeze blowing, and as the day wore on the sun gained considerable power, the only drawback being the terrible amount of dust. In places where a number of cars were travelling at short intervals apart it developed into a dust storm, and left very visible marks upon the clothing and features of the occupants. Nothing transpired to mar the pleasure of the journey. The rule as to passing being in most instances rigidly adhered to, it became more or less a “procession,” although, naturally, some cars took advantage of their superior horse-power where they could without infringing the regulations.

The route lay through the well-known, but always delightful scenery of Surrey and Sussex, the trees now decked in all the beauty of their autumn dress. The only compulsory stop on the way down was at the busy little town of Dorking, where most of us took advantage of the fifteen minutes’ wait to stretch our legs, and also to refresh the inner man. Automobilists are hungry folk, and 6 a.m. is to many an unearthly hour to make a really good breakfast. The fifteen minutes soon passed, and the signal to start being given, away we went through Ockley, Slinfold and Billingshurst, all charming places, to Pulborough, with its pretty river, known to all London anglers as a haven of delight, and also a good place to fish, which perhaps appeals more directly to them. Arrived at Bury, we all stopped at the foot of the hill, and were started at close intervals for the climb. The official results are not yet known, but we can say that the “Martini” went up in fine style, on third speed most of the way, passing on the way five cars of various makes and weights.

Thus far the police had left us alone, but nearing Broadwater we were warned of a measured $\frac{1}{4}$ mile. Their efforts, we believe, were in vain, although the constable we spoke to professed to have stopped several. Strange to say, it was at this particular village that anything approaching a catastrophe, as far as we know, nearly occurred. The children here, as in all the places we passed through, were greatly interested spectators, but, the police being otherwise engaged, the children were left to themselves. One little mite, not realizing the danger, ran in front of our car. Fortunately the driver applied the brake instantaneously, otherwise the pleasure of the trip, as far as we were concerned, would have been completely spoilt. Warne’s Hotel, our destination at Worthing, was reached at 12.15. Our Observer having given us leave until 1.30, we repaired to the hotel, a motley looking crowd. A stroll on the front after lunch, among the crowd of automobilists and inhabitants gazing at the wonderful display of cars, was decidedly interesting. The air was fresh and invigorating, and no doubt many would have delayed their departure, but at 1.37 we started on the return journey. The police were again active near Finden and Southwater, but we had timely warning of their movements. A compulsory stop of fifteen minutes was made at Horsham, and after that the journey was uneventful. At various stages we passed cars on the roadside less fortunate than ourselves, but heard of no serious breakdown. We arrived at the Palace after a non-stop run at 5.15, tired and dusty, but thoroughly pleased with the day’s experiences.

TUESDAY—TO FOLKESTONE.

MID DUST AND RAIN.

WITH the barometer falling, the outlook for Tuesday's run to Folkestone was not altogether hopeful. However, where duty calls there is no faltering, and having accepted Messrs. Mann and Overton's invitation to a seat on the 24-h.p. Georges Richard (No. 103), we prepared for the worst, that is to say, of

The Cars passing through Ightham.

weather, for, as regards the car, nothing better could be desired our run, as the narrative will show, resulting in a non-stop record. When we arrived at the Palace and sought out No. 106, we found it to be unlucky in its starting number, having to be content with a position a long way down the line—to be precise, the 79th. The party consisted of the Marquis de Noë, who has come over from France to drive the car, the Observer, Mr. Walford, the writer, and a French mechanic whose knowledge of England and of the English language dates from the early part of last week. On lining up on the Parade outside the Crystal Palace, it was seen that No. 91, the 12-h.p. De Dion driven by Mr. Stocks, occupied the position in front to us, while to the rear was No. 62, the 7½-h.p. Wolseley. Some misgivings of coming trouble were created by the discovery, just as we were about to start, that the pipe conveying the petrol from the tank to the carburettor had sprung a leak. However, this was temporarily patched up, and at 7.55 a.m. we were officially despatched on our long journey of 137½ miles. As far as Maidstone the way was over the same road as that followed on the run to Margate, so that the drivers were familiar with the ascents and descents, not to speak of the sharp and winding turns to be encountered in that portion of the journey. At Shortlands we came across the 10-h.p. Horbick (No. 56) which, after making a non-stop run on Monday, was, as events proved, in for a bad time. The "tricky" entrance into Bromley was safely negotiated, and the stiff hill leading up to Chislehurst Common reached. Here we discovered the advantage of having 24-h.p. at our disposal by taking the hill in excellent style, passing three or four cars *en route*.

Foots Cray next came into view, after which we had a long straight processional run to Swanley, amid market gardens and Kentish orchards, with five cars in view in front of us and four following up closely behind. At Swanley the unfortunate 6½-h.p. Cadillac (No. 14) was seen to be in difficulties, which it is to be hoped were of but a temporary nature. At

this point the rain endeavoured to come to the aid of the motorists by laying the dust, but instead of doing the work gently it eventually thought better of it, holding off to give us a good drenching in the afternoon. A long steep descent through a chalk cutting brought us to Farningham, with its ancient bridge across the Darent, after which came a long, steady pull for about 5½ miles to the summit of Wrotham Hill. The view from this point is considered one of the best in the whole of Kent, but on Tuesday it was nothing more than a vast sea of mist. The long pull brought the 14-h.p. Brooke (No. 68) and the 14-h.p. Renault (No. 113) to a brief stand, while the 10-h.p. White steamer (No. 116) was passed, busy repairing a punctured tyre. The 24-h.p. Georges Richard kept up a steady, unfaltering pace, and the descent into Wrotham, though somewhat dusty, was greatly enjoyed. Some amusement was caused near this old-time place by the appearance of two policemen mounted on bicycles, causing thoughts of police-taps to immediately fly through the mind. It is strange how instinctively the pace is slackened on sighting a policeman—be the speed well within the legal limit, there is an uncontrollable movement to slacken. Without incident we found ourselves, exactly as the clocks were striking 10 a.m., pulling up in the High Street, Maidstone, close to the gun that seemed to threaten all who made unnecessary commotion on the King's highway. Maidstone has seen some stirring scenes. In the reign of an earlier Edward it was invaded by Continental merchants, who started the woollen industry there. In the 17th century General Fairfax stormed the town; in the twentieth century a new event was added to the category of great epochs in the town's history by the temporary stay—for fifteen minutes—of four score motor-vehicles, representative of a movement that will do more for the industries and prosperity of Kentish towns than ever did Edward III. or General Fairfax.

Leaving Maidstone at 10.15 a.m., we next made for Ashford, the steam wagon of the Mid-Kent Water Company indicating to us the way to be followed. For the first four or five miles there is little of interest on the road, although farms and villages are passed in pleasant succession. We got a glimpse, as we passed by on our fourth speed, of Leeds Castle, which, built in the thirteenth century, is still surrounded by its moat. Harrietsham, an old time village, famous since the seventeenth century as being the residence of Nicolas Wood, who by eating a whole hog at one sitting earned the sobriquet of "The Great Eater of Kent," was rapidly traversed

A Wolseley Paddling through the Rain.

in company with a number of other cars, including the 14-h.p. Brooke, the 16-h.p. Rochet-Schneider, and the 12-h.p. Gladiator driven by Miss Levitt, and soon we had left Lenham and Charing, two spots we hope to visit, when, with time not so pressing, their reminders of a bygone age may be inspected. Since leaving Maidstone we had not passed a single car *en panne*, the procession keeping steadily on through Ashford and Willesborough,

THE FRINGE OF THE TRIALS.

where the rain began to fall in earnest, and where, in addition, several shopkeepers had been sprinkling the roads in front of their premises to lay the dust. At length the sea came in sight, and soon we were running alongside it at Hythe, where the three-cylinder Argyll, No. 49, was seen to be in distress. Just as each evening's run finishes with the stiff ascent up to the Palace, so did the outward run to Folkestone terminate with an arduous climb from Sandgate. Up we went, however, and within a few moments came to rest on the lawn in front of the Metropole, our inward time being recorded as 12.7 p.m.

The return journey in our case was commenced at 1.45 p.m. in a storm of rain, which not only quickly laid the dust but converted the roads into such a sticky condition as to necessitate very careful driving to avoid side slips. At Hythe we met the 6-h.p. Regal (No. 5) still on its way to Folkestone. Almost as far as Wrotham the route followed was the same as that of the morning, and, notwithstanding the discomforting rain, a steady pace was kept up. Dust may convert us into millers and also cause motor troubles, but our experience is that, bad as is the dust, it is preferable to continuous blinding rain. To add to the troubles of the motorists, it was market day at Maidstone, and every mile or so on the way to that town either a flock of sheep or a herd of bullocks, and some times both, had to be encountered. At Lenham, twenty-six miles from Folkestone, we met the 10-h.p. Horbick (No. 56), still on its outward journey, and having the bad time already mentioned. As we neared Maidstone there was a slight rift in the clouds, and the rain gradually tapered off.

After a fifteen minutes' interval at Maidstone, where the motor cars were mixed up with a thick crowd of farmers' carts of all kinds, the last stage was begun at 4.15, in company with several cars which we had not previously seen that day, including a Lanchester, two White steamers, and Mr. Friswell on the 12-h.p. Peugeot (No. 119). Ightham, Riverhead, and on to the long climb up Polhill, which was taken without a murmur by all the cars in sight, and then through Green Street Green, where its troublesome dogs were once more in evidence. Apparently we were all somewhat in advance of the allotted time, as Lock's Bottom was passed through at a crawl. All along there were signs that heavy rain had been falling, particularly on the descent from Hayes Common, at which point the roads were in an extremely greasy condition. Without incident or accident, we plugged steadily along through West Wickham and Penge and on to the Palace, the gates of which we entered at 6.12 p.m., with a record which secured the 24-h.p. Georges Richard a non-stop award for the day.

Enquiries later in the evening showed that a total of 84 cars had started for Folkestone in the morning, and that at 7.45 p.m. thirty-nine had secured "non-stop" records, thirty-two were back after brief delays, whilst thirteen had not arrived.

WEDNESDAY—TO SOUTHSEA.

AS A FREE LANCE.

UPON reaching the Palace on Wednesday morning we found a vacant seat on a 12-h.p. Clement. This car has not been among those competing since the first day, but has been running independently every day. We were thus free to go as we pleased, and a start was made at 7.40. The morning was inclined to be wet, but the weather improved as the day progressed. Arrived at Hindhead we climbed that well-known hill, among its picturesque surroundings, in first-class style, on third speed nearly all the way. After passing through Fratton we were warned that the police were about, but, driving with care, nothing serious happened. Entering Southsea we were received by the Police Superintendent and several mounted constables, who escorted the first batch of arrivals to the Esplanade Hotel. Lunch over, we left at 1.32 for the Palace. At Sutton we found Mr. Peckham in serious trouble with his 20-h.p. Winton. The crank shaft had broken, and the whole of the day had been spent in fitting a new one. The Palace was reached at 6.5 after a most successful and pleasant journey.

MARGATE, Thursday.

Leaving with regret the busy scenes at the Palace in the afternoon, solace was soon found in the crisp air of the bright autumn day, and as the roads were in fine condition, motoring was indulged in under the most perfect of conditions. Bromley was quickly reached, and Polhill was soon in sight. Down here, and through the village, a turn to the left finds us on the hilly and winding road to Ightham and Wrotham, and thence we are soon in the High Street of Maidstone. An enquiry here elicits the fact that Charing has to be passed (fourteen miles) to reach Canterbury, yet another run of the same distance. With the night drawing in, and over some lovely roads, we quickly find our way to our destination—Margate. On Kent roads there is usually heavy traffic, and to-day was no exception to the rule. The dust also, inevitable on these roads, was troublesome, but a pleasant surprise was a lane, about a mile from Charing, just wide enough for the car, with a signpost pointing to Canterbury. Without hesitation we turned round here and found it dead straight, with no traffic, only lots of tame partridges, which scarcely condescended to run out of the way. A lovely spin was indulged in, and the journey was altogether delightful. By now it would have been thought that all the epithets which could be applied to motorists had been exhausted. But apparently this is not so, for a passing cyclist greeted us with, "Halloo! dusthole." Our distance for the day was eighty-two miles.

MARGATE, Friday.

Friday broke gloriously fine, and favoured indeed we felt that fate had ordained our business should be conducted under such pleasant conditions. Sunning ourselves in the doorway of the hotel we met Mr. Edge, who had arrived at 11.15 after an uneventful journey, and he had for company Mr. Vincent, of the "Times," and his usual bulldog. Finding it was time to take up our position in Cecil Square, very commodious and quiet for the purpose of assembling the cars, we there waited patiently with others for the first arrival. This was Mr. Weigel, on a Clement, and he rode into the Square at 12.13, eighteen minutes, we afterwards learnt, ahead of his time. A couple of minutes' interval, and then came Mr. Du Cros; and Mr. Instone, with a party of Pressmen, being followed quickly by four other cars, including the ten-seated Daimler, until at 1 o'clock there were fifteen cars, with numbers on, in the Square.

Shortly afterwards Mr. Weigel left for the homeward journey, followed by Mr. Edge, and at short intervals by others, but in the meantime arrivals were coming in slowly, Miss Levitt, in company of several others, arrived at 11.30. A dozen cars followed in quick succession, and then a party of eleven, all close up, led by Mr. G. Iden on his M.M.C., appeared on the scene, the remainder, to the number of over one hundred, coming dribbling in within the next hour.

HASTINGS, Friday.

At two o'clock we left the scene at Margate, having to proceed to Hastings on our way for the morrow's function at Eastbourne. The route lay through Ramsgate, Sandwich, and Dover, and here we would like to state how difficult it is to find one's way about in the Isle of Thanet. The signposts are only painted on one side, and all the roads are so made that it shall not be possible for the unwary traveller to lose himself; but if he perseveres he is sure to find himself back to the point from whence he started. The finding of our way proved most difficult, but ultimately Sandwich was reached, and then there was a delightful run over the Downs into Dover, the surface of the road being in grand condition and no traffic about. To Folkestone, over the cliffs, and Romney, across the marshes, to Rye, is a run well known, but portions of the latter road are simply wonderful in the way they curl about. A snake could not indulge in such contortions, and the only similar road to compare it to would perhaps be the Irish Gordon Bennett course. A shilling toll at Rye, and for this, being on private ground, we indulged

in a mile spin on fourth speed, a luxury we seldom enjoy. To Winchelsea is not far, but, leaving the lane, a portion of a hill, at an acute angle, is struck, with a gradient of perhaps one in seven. On this hill there is usually traffic, and the turning is one of the most dangerous within our knowledge. Hastings, still through the same narrow turnings, is soon reached, and here our narrative ends for the day. Distance, seventy miles.

EASTBOURNE, Saturday Afternoon.

Saturday again broke fine, and leaving the Palace Hotel, Hastings, one of Spiers and Pond's, where it was impossible to obtain ham and eggs for breakfast, we soon reached the beautifully-situated Grand Hotel, at Eastbourne, when the hall porter handed us an open telegram from Mr. Joy, announcing two police traps prepared for the return journey between Dicker and Hoathley, and Wellfield and Crowborough. Mr. Edge, with Mr. New, did not arrive till 11.27, and from him we learnt that he had been the means of breaking up two police traps, within half a mile of each other, between Frant and Mayfield, although at the expense of having his name and address taken. The *modus operandi* of the police was very simple. A measured distance, an electrical timing device, two policemen, and a clerk, with a desk, to take the numbers. That's all, and that's what the Automobile Parliamentary Party has prepared for all of us in the coming year. The next car was Mr. Weigel's, but we learnt his vehicle had been disqualified; therefore the first actual competing cars in were Mr. Astell's New Orleans, a 15-h.p. Germain, at 11.43; the Martini came next, and others followed in quick succession until at 12.10 there were fifty-three cars in line. An informal committee meeting was called, and it was decided to postpone the return journey till 1.30, a decision that was much appreciated, and which enabled all and sundry to partake of the bountiful spread provided at the Grand Hotel. Punctually at the half-hour the cars went away, literally *en masse*, without regard to order, and within a few minutes only a few stragglers were left, including one that did not seem like moving any more. Clarkson's Steam Supplies Van reported doing good business, and must have injured the trade of the local dealers.

At Eastbourne, the greatest interest was taken in the cars, and the well-dressed and fashionable folks present evidently knew something of the subject they were discussing, by naming this and that car. Public-service vehicles seem very popular in Eastbourne, and the two-decker Milnes omnibuses at Hastings were always full.

BRIGHTON, Saturday.

Leaving at three o'clock, we met Mr. Peckham, on a Winton, just entering the town, and while passing Polegate, a car with a number on was seen in trouble by the wayside. Lewes, Brighton, and Worthing and back to London-super-Mare completed our day's run. Distance, fifty-six miles.

WORTHING, Monday Afternoon.

Sweet September is retrieving its reputation, and, although the air in the mornings and evenings may be chilly, yet the afternoons are as warm as one could wish. Sunday at Brighton was an immense success; the sun shone and the skies were cloudless, and the "Old Ship" was seething with excitement as motor after motor came to the door, disgorging its passengers. It certainly made us marvel how Mr. Burekhardt found accommodation for all his guests. The trains also brought down a rush from the Palace, and these latter filled up the day by riding up and down the front in "flits," or making excursions on friends' cars. The sea front, as usual, presented a busy scene, but the majority of vehicles were motors, and outside almost every hotel cars were to be seen in numbers. Among the notabilities seen were Mr. Dalziel, M.P., Capt. A. Hill, M.P., with a 20-h.p. M.M.C. and a 7-h.p. Panhard, two men in semi-military uniforms and white service caps, the Grossmiths, etc.

Monday opened with the sun shining brilliantly, although there was a powerful east wind blowing (and may it continue all this week, and before nine o'clock we were again travelling on our Mercedes, making for Bury Hill, to witness the hill climbing. Unfortunately, at Washington, Mr. Peall, on his new 10-h.p. Panhard, took a wrong turning and we followed, with the result that our original intention had to be abandoned, and

therefore we made for Worthing, through Findon. Distance, twenty-one miles.

At Worthing, Host Warne had made elaborate preparations for the welcome of his visitors, and, in addition, on the lawn in front of the hotel numerous lounge seats and tables had been placed, and here, under the pleasantest of conditions, these notes are being written.

Smiling and smart as usual, Mr. Edge, with the "Evening News" representative as passenger and his "bull" as companion, appeared on the scene at 10.30, and his arrival was preceded, as usual, by the Clarkson Supplies Van, which affords some amusement between us, as we keep meeting in all sorts of out-of-the-way places. We learnt that ninety cars had started from the Palace, and in the meantime several private cars had arrived from London. The first numbered car was the 6-h.p. De Dion, which arrived on time at 11.30; this was quickly followed by five others, and before 12 o'clock thirty-two cars had arrived; by 12.15, sixty-four; and others were coming in in quick succession. The cars are beginning to show signs of the absence of the hose pipe, although the dry weather has prevented them from being as bad as they might have been. One or two punctures occurred, but otherwise the run seemed to have been devoid of incident, except for the discovery of a police trap about a mile outside of Worthing. Thanks to a friendly cyclist, all escaped stoppage.

FOLKESTONE, Monday Night.

The start for the return journey was delayed till 1.30, and the cars quickly disappeared. For ourselves, we made for Folkestone, through Shoreham, Brighton, Lewes, and by various unknown lanes, many with the grass growing over, to Battle, where an unkind policeman directed us through lanes until we came out near Robertsbridge and had to retrace our steps almost to Hastings, causing a delay of more than half an hour. However, we ultimately struck Winchelsea and Rye, and found a new and shorter way over the Romney Marshes to Hythe, reaching Folkestone after a very cutting ride in the teeth of an easterly gale. Distance for day, 101 miles.

FOLKESTONE, Tuesday.

Five minutes after half-past ten this morning, and in the midst of a slight shower, Mr. Edge arrived at the Metropole, Folkestone, with Mr. Sharp as passenger, and accompanied by his usual four-footed friend. A consultation with the manager ensued, and it was decided that the cars should be drawn up on the beautiful flowered lawns, and Mr. Edge's car was then placed in position with the bonnet facing the hotel. The morning had broken warm and close, with ominous looking clouds about. It was thought these would blow away, but as the cars began to arrive the rain commenced to fall in earnest. The previous spots were thought to be just the pride of the morning, but that this was not so many proved afterwards by the fifty-mile ride we had in a blinding storm. The first to arrive was Mr. Harvey du Cros, jun., on his Ariel, but as this was not in the competition, it had to stand alongside our Mercedes. At 11.40 a.m. six cars came in together, with Mr. G. Iden on a M.M.C. leading, then another dozen in groups and singly, all close up, until by 12 o'clock forty cars had arrived; another ten came in within five minutes, and by 12.10 at least seventy cars had arrived—drivers and passengers alike were smothered in dust, while the cars certainly looked as if a good shower of rain would do them good. Eighty-four cars started from the Palace, and, as far as we could gather, the run was devoid of anything sensational. Valves stuck and broke; carburettors got choked with dust, radiators leaked, and generally those who had been hitherto jubilant seemed to be somewhat in the dumps. As a matter of fact all realise the severity of the trials, for there are no private motorists who desire to run their cars under such circumstances as they are now being run day after day, for a thousand miles, without being touched.

SOUTHSEA, Tuesday.

Leaving the courtyard of the hotel at Folkestone a few minutes before one, we started on our journey for Southsea, and in the midst of a blinding storm, and over greasy, chalky roads, we pursued our way across the Romney Marshes, to Rye and

Winchelsea, having to stop for three level crossings and innumerable flocks of sheep and herds of cattle, through Ore and Battle, over fine gradients, and then over similar superb roads to Lewes and Brighton, where a halt was made for an hour. Then came a run through Arundel, Chichester, and Havant, with the roads in good condition and no signs of recent rains, to Southsea, which was reached in the dark about seven o'clock. Distance for day 121 miles.

SOUTHSEA, Wednesday.

LAST evening a thick mist settled on Southsea Common, and on Wednesday morning it had not cleared; in fact, was rather worse. Sleeping in an hotel facing the sea, the writer was kept awake all night by the hoarse soundings of fog-horns of vessels in the Channel, and when at last drowsy Morpheus claimed us for his own, it seemed but for a moment, for the most discordant sounds were heard, blatant enough to waken the sleepers of Ephesus. Clambering on to the leads outside the window, a glance showed us about forty of the military, and these were evidently having a lesson with musical instruments—for the instructor played a moment and then the novices essayed to imitate. The result was—well, heartrending.

Taking up our position in the mist, we patiently awaited the coming of Mr. Edge, but 11 o'clock went by, 12 o'clock passed, and still no sign of the Napier—or any other car. What was wrong? The Hon. Marshal was always so punctual, and still there were only a few local cars about—curiously enough, two, a De Dion and a 7-h.p. Panhard, being driven by ladies.

However, shortly after twelve a Clement came down from the Palace, and we learnt that the first car, driven by Mr. Joe Lisle, who enters the noble army of benedicts next week, had been stopped just outside the town, so that more cars should come up and have the honour of being escorted through the town by the local police. The honour, however, was not much appreciated, but the competitors had to have it, and it was 12.30 before the Star car appeared at the head of a small procession of cars close on the heels of the perspiring horses of two galloping mounted patrols. Within a moment or two, twenty cars were in line; then came Mr. Stocks at the head of eleven more, followed by the Serpollet, and just outside was a 15-h.p. Germain mending a puncture. The cars then dribbled in at intervals, until at 1.30 arrived in a bunch a 12-h.p. and a 10-h.p. Gladiator, a 14-h.p. Brooke, a 10-h.p. Georges Richard, a Lanchester, a Beaufort, a New Orleans, a Spyker, a 20-h.p. M.M.C., and one or two others—but already the first car had started on its homeward journey.

The next lot of arrivals was headed by Capt. Deasy on a Rochet Schneider, followed by a Georges Richard, a Regal, an Elswick, and a Century. The Supplies Van duly appeared on the scene before twelve, having come over from Brighton, where it had been detained overnight through the fog.

All had the same tale to tell of police traps—some said there were dozens of them, all agreed there were a number, but in almost every instance, thanks to friendly cyclists, these were circumvented. Several cars in coming down had trouble with their valves carburettors, etc., and there were one or two punctures, but the comparative absence of dust was much appreciated. Mr. Edge we much missed, for had he been there the cars would have been lined up better.

For ourselves, owing to an unfortunate back-fire, through someone having supplied a gummy material called oil, our mechanic had to rest for a couple of days, so we have had the felicity of a four-hours ride in a stuffy railway carriage. We could have done the journey on our car quicker, under more comfortable circumstances, and at a great deal less cost.

By wire we learned in the evening that of the eighty-three cars which had left the Crystal Palace in the morning, only thirty-five had arrived back at eight o'clock, eighteen of which had made non-stop runs.

ENTRIES for the speed trials to be held on the Dourdan Road, near Paris, on the 22nd Oct., are steadily being received, the latest list showing twenty-six names.

TRIAL NOTES.

GOING to Bury Hill on Sunday, Mr. R. E. Phillips lost one of the dust caps off his car. It was marked Rochet-Schneider, Lyon, and should anyone have found it Mr. Phillips will be obliged for its return.

THE following is a list of the non-starters, the absence of the cars being in several cases due to late arrival on Tuesday of last week, in others to the vehicles not being ready in time, and in one or two instances to the cars being considered duplicates of other entries:—No. 6, 6-h.p. Siddeley; 7, 6½-h.p. Century; 8, 7-h.p. Vesta; 10, 6-h.p. Wolseley light car; 13, 5-h.p. Beeston Humberette; 22, 7-h.p. Cottereau; 26, 7-h.p. Coronet; 27, 10-h.p. Century; 30, 10-h.p. Pick tonneau; 31, 10-h.p. Pick voiturette; 32, 9-h.p. Mathieu; 33, 9-h.p. Renault; 44, 8-h.p. Standard; 45, 19-h.p. Arrol-Johnston; 46, 7-h.p. Star; 53, 12-h.p. Century; 55, 9-h.p. Humber; 61, 10-h.p. Ryknield; 69, 16-h.p. Okodyne steam car; 72, 20-h.p. Hallamshire; 73, 12-h.p. Cremonne steam car; 74, 12-h.p. Arrol-Johnston; 76, 16-h.p. Century; 81, 12-h.p. Belgica; 88, 12-h.p. Sunbeam; 98, 16-h.p. Elswick; 101, 20-h.p. Welbeck; 103, 12-h.p. Gobron-Brillie; 107, 20-h.p. Velox; 110, 12-h.p. Chelmsford steam car; 112, 15-h.p. Pipe; 115, 25-h.p. Cassell; 124, 15-h.p. Daimler; 135, 22-h.p. Daimler; 138, 24-h.p. Hart petrol-electric; 139, 18-h.p. Wilson and Pilcher.

THE Century Engineering and Motor Company, Ltd., ask us to mention that although they entered five Century cars altogether in the different classes, they were unfortunately not able to be ready with more than one, viz., a Century tandem in class A 1. The machine which they have actually put in for the Trials is the standard type 5-h.p., tandem cylinder, bore 84 mm., stroke 90 mm., instead of the 6½-h.p. tandem as entered in the official catalogue.

THE results in miles per hour for the twenty fastest cars in the Westerham Hill Climb on Saturday were as follows:—No. 137, 22-h.p. Daimler, 14.95 m.p.h.; 102, 24-h.p. Wolseley, 14.85 m.p.h.; 133, 20-h.p. M.M.C., 13.91 m.p.h.; 114, 14-h.p. Martini, 13.50 m.p.h.; 92, 12-h.p. New Orleans, 12.43 m.p.h.; 91, 12-h.p. De Dion Bouton, 12.41 m.p.h.; 130, 16-h.p. Rochet-Schneider, 11.66 m.p.h.; 113, 14-h.p. Renault, 11.62 m.p.h.; 108, 16-h.p. Dennis, 11.46 m.p.h.; 105, 10-h.p. Gardner-Serpollet, 11.07 m.p.h.; 97, 15-h.p. New Orleans, 10.96 m.p.h.; 134, 16-h.p. Flat, 10.70 m.p.h.; 140, 24-h.p. De Dietrich, 10.47 m.p.h.; 120, 20-h.p. Germain, 10.44 m.p.h.; 34, 10-h.p. Georges Richard, 10.02 m.p.h.; 126, 16-h.p. De Dietrich, 9.99 m.p.h.; 129, 15-h.p. Pipe, 9.79 m.p.h.; 52, 10-h.p. Wolseley, 9.73 m.p.h.; 77, 12-h.p. Star, 9.65 m.p.h.; 66, 12-h.p. Gladiator, 9.49.

THE following table gives the average speed in miles per hour of the twenty fastest cars in the Bury Hill Climb on Monday:—

16-h.p. Rochet-Schneider ...	17.29	20-h.p. Germain	13.65
10-h.p. Gardner-Serpollet ...	17.00	10-h.p. White	13.64
14-h.p. Martini	16.61	12-h.p. Gladiator	13.39
24-h.p. Wolseley	16.56	15-h.p. New Orleans	13.37
24-h.p. De Dietrich	15.05	16-h.p. Dennis	12.53
22-h.p. Daimler	14.97	12-h.p. New Orleans	12.45
24-h.p. Georges Richard	14.61	12-h.p. De Dion	12.23
20-h.p. M.M.C.	14.43	20-h.p. Humber	11.80
16-h.p. Fiat	14.11	24-h.p. Darracq	11.77
16-h.p. De Dietrich	13.96	20-h.p. Thornycroft	11.64

WESTERHAM HILL was the scene of a bad accident during the progress of the Trial on Saturday. A cyclist was approaching the foot of the hill, where there is a cross-road, when one of the White steam cars turned the corner suddenly and silently. The cyclist who seems to have lost control of his machine, dashed into the car with terrific force, his head striking the mud-guard of the motor. Everything possible was done for the injured man. A car was despatched for a doctor, a distance of three miles and eventually the cyclist was removed to Sevenoaks Cottage Hospital, six miles distant from the scene of the accident.

AMONG the private cars following the Trials, on Tuesday, was one driven by Mr. Joseph Temperley, carrying as passengers the Head Constable and Borough Engineer of Reigate. The former pointed out to the Club officials that he was not responsible for the numerous summonses heard at Reigate, having only taken out three since 1896. The tradesmen of Reigate greatly resent the interference with automobilism which has caused motorists to boycott Reigate.

THREE miles of road, viz., between Gappon Point (after Merstham) and Nag's Head (approaching Horley), which includes the whole of Redhill, are under the Reigate police, who do not take out technical summonses for infringements of the speed limit.

THE 14-h.p. Brooke car, No. 68, comprises a number of improvements, notable among which is the employment of a pressed steel frame. The three-cylinder engine is retained, but in addition to the pedal-controlled suction governor, the speed of the motor can now also be controlled by a hand lever which varies the lift of the suction inlet valves. Other modifications in connection with the engine are a cold air inlet, controlled from the dash board, pressure-fed lubrication, and improved gravity water circulation; chains are still used in the change gear box, the latter has now three-point suspension, and has been reduced in weight. Furthermore, the ratio of the gear between the engine and the road wheels has been altered, larger sprockets now being used to give the same result as hitherto. A number of other changes have been made in the new car, the total weight of which comes out at about 4 cwt. less than the old model.

A NUMBER of new features are noticeable in the 10-h.p. Horbick (No. 56), which Messrs. Horsfall and Bickham are running in the trials. The two-cylinder engine (4 3-16 in. diameter by 4 1/2 in. stroke), is now fitted with mechanically-operated inlet valves. The cam-shaft is arranged so that it may easily be removed, while a honeycomb type of radiator with fan is now used in connection with the cylinder cooling. The transmission is by cardan shaft and bevel gear, a new form of spring drive being introduced, to take up any shock from the engine or gear when changing speeds. The "Horbick" cars have already earned a good reputation in the north, which should be fully maintained by the new-model car.

No. 13.—The 5-h.p. Humberette.

ENTRY No. 14, the Cadillac car, is a new American-built vehicle, which is being introduced into this country by the Anglo-American Motor-Car Company. The motor is a single cylinder horizontal one of 6 1/2-h.p., with cylinder and head cast in one piece. The cylinder is 5 in. dia. by 5 in. stroke. The bearings have bronze bushings; those on the crank shaft and crank pins can be removed without taking the shaft from the engine frame. The ignition is electric and a device is fitted making it impossible to start the engine while the spark is advanced, thereby avoiding accidents. The engine is water cooled, the water being passed through a single section coil of twelve seamless tubes five-eighths of an inch in diameter, over which are slipped copper radiating discs, three-eighths of an inch apart.

The speed of the engine is controlled by means of a throttle, the lever being located on the steering pillar. The silencer connection is fitted with a cut-out for use on country roads, where noise is not objectionable. The carburettor is claimed to be one of the special features and to require no adjustment for any variation in speed or atmospheric conditions. The cylinder is screwed into

No. 14.—The 6 1/2-h.p. Cadillac.

the crank case, instead of being bolted on, and it is claimed that this method is a substantial improvement on the older style. The water jacket is of spun copper, instead of cast iron. The inlet and exhaust valves are both mechanically operated and are exceedingly accessible. The differential gear has large braking surfaces keyed directly to each wheel shaft, which act the same as drums on the rear wheels. Instead of the tiller steering usually found in American cars, the steering is effected by means of an inclined hand wheel and an adjustable irreversible mechanism. The body frame is built up of angle steel and is supported by semi-elliptic springs at the front and rear. The transmission gear is of the epicyclic type, the pinions and gears being of steel and bronze respectively. All parts of the gear run in oil, fed through one oil hole only. The gear gives two forward speeds and reverse, the high gear giving speeds on the level up to from 30 to 35 miles an hour. The body is designed so that by loosening four nuts the whole of it can be removed, and without making a single disconnection of any kind. The car is made in two styles, as a runabout with a seating capacity for two and large space for luggage, or with detachable tonneau body, accommodating two more passengers. On the first day of the trials the car made a non-stop run to Margate and back, but on the way to Eastbourne, on Saturday last, it met with an accident at the foot of Riverhill, a wheel being broken as the result of a collision.

THE inaugural luncheon was a pleasant function, Colonel Crompton's speech being the *piece de resistance*. Often have we heard the Colonel, but never before in such good form. He dealt with the man on the motor and the man in the street in pungent style, and rallied the Press on their anti-motor attitude in a way that should help to secure better recognition in future. Mr. Roger Wallace and Mr. Shrapnell Smith spoke well and to the point, and a graceful tribute was paid by the chairman to the organisation by Mr. Basil Joy, which was re-echoed by the company with musical honours. It was a fitting beginning to a notable event.

CONSIDERABLE excitement prevailed in the Observers' Tent on Tuesday evening, when, as the result of complaints, Mr. Basil Joy deemed it necessary to strongly urge the Observers to see that the rules as to speed and passing were strictly adhered to. They were, he said, the representatives of the Club during the trials, and were being relied upon to see that the competition was carried out properly. It was their duty to note any infraction of the rules, and he trusted that they would warn the drivers of any excess of speed, or passing on forbidden sections, and make due note of the same in their reports.

The Motor-Car Journal, Saturday, September 26th, 1903.

THE RELIABILITY TRIALS. THE DAILY RECORD.

Official No.	H.P.	CAR.	Friday.	Saturday.	Monday.	Tuesday.
CLASS A1.—Tandems, Quadricycles, and similar two-seated vehicles, over 170 lbs. weight, at a selling price of £100 or less.						
1	—	Century Tandem	D.	A.	A.	E.
2	6	Eagle Tandem	A.	A.	A.	E. S.
3	8½	Rex Tricar	C.	Retired.	A.	
CLASS A.—Vehicles of a selling price of £200 or less.						
4	—	Baby Peugeot	A.	A.	A.	A.
5	6	Regal	W. S.	A.	A.	E.
9	6½	Vulcan	A.	A.	Collision.	
11	—	Stanley Steam	A.	Serious delay.	A.	A.
12	5	Coventry Humberette	A.	A.	A.	E.
14	6½	Cadillac	N. S.	Wheel broken.	A.	E.
15	—	Pony Richard	C.	Retired.

MOTOR-CYCLING NEWS.

TO-DAY (Saturday), the Wolverhampton Motor Cycling Club is holding a run to Rugeley to meet the members of the Birmingham Motor-Cycle Club.

A BOOK of hints for the use and guidance of riders of the Gamage motor-bicycle has just been issued. It deals exhaustively with the question of lubrication, ignition, the carburettor, the care of the motor, starting, stoppages, and their causes, the sparking plug, valves, etc., and should be found exceedingly useful by riders of "Gamage" machines.

THE world's motor-cycle track record for 24 hours was given a big upward move on the 5th inst., when Mr. A. A. Hanson, on a Mitchell, beat his last year's record by nearly 75 miles. The run was made at Garfield Park, Chicago, beginning at 3.30 p.m. on the 4th inst., and the distance covered was 701 miles and 1,330 yards, the net riding time being 20 hours and 58 minutes. The previous record for 24 hours was 634½ miles, made on the same track by Hanson.

HEREWITH we illustrate what may be termed a tankless motor-bicycle, which has been constructed and patented by Mr. F. H. Green, of High Street, Cheltenham. The novelty of the machine lies in the fact that the whole of the frame tubes are utilized for the carrying of petrol or other oil. It will be noticed that the machine presents the appearance of an ordinary bicycle with a Minerva engine attached. The frame, which holds nearly a gallon of petrol, is built with slightly larger tubes than usual, and, owing to the special construction of the connecting lugs, the oil circulates freely through the entire set when poured in at the opening provided in the seat pillar. The back mudguard, which is made hollow, acts as a receptacle for nearly a quart of lubricating oil, and is filled at an opening on the top of the guard. A pipe from the bottom bracket is connected to an ordinary F. N. carburettor which supplies the mixture to the 2-h.p. Minerva engine. The sparking and throttle levers have been arranged near the steering pillar, so that the frame space is entirely free to

receive an ordinary touring luggage bag. The accumulators and coil are carried in a small box at rear of saddle. Mr. Green informs us that the machine runs very sweetly, and he attributes this in some measure to the equal distribution of weight throughout the entire frame. He states that he has ridden the machine some hundreds of miles, and so far is very pleased with it. We may add that the machine was built to Mr. Green's design by Messrs. Stretton and Co., Cheltenham.

SEVERAL motor-cars, big and little, have made the attempt to travel from San Francisco to New York. Two automobilists have succeeded in doing it, but no one yet has done it alone, as has been done by a motor-cyclist, nor come anywhere near mak-

ing as good time. Wyman, the rider in question, not only holds the record of being the first to cross the American continent with a motor-vehicle, but he also has the record of time for the journey. Wyman, using a 1½-h.p. motor bicycle, made the trip

A Neckarsulmer Motor Bicycle in Portugal.

in fifty days. Dr. Jackson, with a 20-h.p. Winton car, took sixty-three days, and E. T. Fetch, with a 12-h.p. Packard, occupied sixty-two days.

AMERICAN motor-cyclists now have a national association in the Federation of American Motor-Cyclists, organised in New York on the 9th inst., at a meeting of eighty-seven enthusiasts from different parts of the United States. The rules provide for an association subdivided into four districts, Eastern, Southern, Western and Pacific. One of the chief objects for which the organisation will at once work will be to secure legal recognition of the motor-cycle as a bicycle and to free it from the restrictive automobile classification in which the laws of many American states now hold it.

MISS MURISON left Land's End on Tuesday afternoon on a motor-car for John o' Groat's.

THE new Collier Company has been registered, and the style of the Collier Twin Tyre Company, Ltd., will in future be the Collier Tyre Company, Ltd.

FOR allowing his motor-car to stand on the highway so as to cause unnecessary obstruction, Mr. G. Tickell, of Clontarf, Dublin, has been fined £1 and costs at the Kingstown Police Court.

QUEEN CHRISTINA of Spain, accompanied by the Infanta Maria Thérèse, arrived in Paris from Vienna on Tuesday. Later in the day her Majesty and her daughter proceeded on a motor-car to the Chateau of Epinay.

CONTINENTAL NOTES.

ALL hopes of any summer weather seem now to be gone completely, and it is time to think about covered bodies to motor-cars for the winter season. Frames will next year be made sensibly longer, and almost all cars will in future have the entrance at the side, so that lady passengers can get in and out from the side walk, instead of having, as at present, to get in at the back, and for that purpose get down into the muddy street, as the car can hardly be backed on to the pavement. The days of the tonneau are therefore numbered, and the double phaeton is likely to take its place. Bodies are gradually being made also much more roomy. Another body which is passing out of fashion is the Roi des Belges, which hardly anybody wants now.

ATTEMPTS to beat the kilometre record at Dourdan used to be almost daily events, but lately they seem to have gone completely out of fashion. Perhaps it may be that the record has been pushed up and up and has reached such a pinnacle now that it needs a tremendous horse power to do anything really great.

In the Desert in Nevada.
Snapshots of the Packard Petrol Car, which recently made the Journey from San Francisco to New York.

THE Criterium of $\frac{1}{4}$ litre began on September 16th at the Parc des Princes, Paris, and brought together a very considerable number of entries, which have been divided into six different heats, which were run last week, the weather having been fairly favourable. The competition was for motor-cycles whose cylinder capacity was not more than one-quarter of a litre—that is to say, one twentieth of an imperial gallon. Tests of the capacity of the cylinder or cylinders of each machine were made by pouring water into them when the piston was at the lowest part of its stroke. The machine thus measured was then marked and was ready to compete.

THE race was held on the track over a distance of 100 kilometres. On Wednesday the first heat took place, and there were thirteen starters. The interest of the competition was increased by the fact that motors with an explosion every two strokes instead of every four strokes were allowed to take part in the race. The first and second in each heat competed in the final. The first heat fell to Champoiseau, who took the lead almost from the start and kept it during the whole time. He was driving a Griffon motor-cycle with belt transmission, and his time was 1 h. 28 min. 37 1-5 sec. Bucquet on a Werner took the second place, 9 min. 42 3-5 sec. later. The average

speed of the winner was 67 kilometres 700 metres per hour—nearly 42 miles. A Griffon ridden by Bonnevie won the second heat in 1 hour 32 min. 4-5 sec., Mignard being second on a Knap. Demester on another Griffon won the third heat in 1 h. 35 min. 23 1-5 sec., followed by Mathieu on a Lurquin et Coudert. In the fourth heat Kinet on an Antoine won in 1 h. 31 min. 25 4-5 sec., and Collomb on a Peugeot took the second place in 1 h. 36 min. 40 sec.

THE fifth heat fell again to Champoiseau on a Griffon, but his time was not as good as before, 1 h. 31 min. 12-5 sec. Carreau was second in 1 h. 36 min. 49 3-5 sec. In the sixth and last heat Lanfranchi on a Peugeot belt-driver beat the world's record and made the best time of the whole meeting, accomplishing the 100 kilometres in 1 h. 23 min. 9 3-5 sec.; indeed, he beat all the world's records during this heat, for he did over 72 kilometres (44 miles 6 furlongs) in 1 hour and 50 kilometres in 41 min. 34 1-5 secs. Louvet was second on a Griffon in 1 h. 29 min. 44 3-5 secs.

THE final was run on Sunday at two o'clock, when, in glorious sunshine, the twelve competitors started at the pistol shot. Lanfranchi got off very badly, but soon reached the first place and kept on increasing his lead lap by lap until at the twenty-second

At Levelocks, Nevada.

lap, with a lead of 2 min. over the nearest competitor, he had a puncture on his back wheel and had to stop to change his air-tube. When he restarted he was 6 kilometres behind-hand, and, therefore, quite out of the running. Jacquelin and Kinet were now leading neck and neck, followed by Mignard and Carreau. Soon, however, Jacquelin began to run irregularly, was left behind, and Kinet kept the lead in hand until nearly the end, when a puncture on his back wheel sent him flying and put him out of the race, to his great mortification. Mignard was then in the lead, with Jacquelin three laps behind him, and running strong and gaining lap by lap. But bad luck was awaiting him, and when just on the point of passing Mignard his petrol pipe gave way and he had to walk in, leaving Mignard on his Knap motor-cycle an easy winner in 1 h. 31 min. 11 2-5 secs. Champoiseau, on a Griffon, made a splendid race, and, notwithstanding his puncture, was second in 1 h. 34 mins. 15 3-5 secs.

THE plans for a tourist vehicle run from Paris to Rome next year are being steadily prepared by "La France Automobile." After inspection of the roads between the two cities, the route definitely decided upon is *via* Dijon, Lyons, Marseilles, Nice, Turin, Milan, Bologna, and Florence. The competition, which is confined to tourist vehicles, will comprise two categories, viz., one for vehicles covering the entire distance between

Paris and Rome and taking part in all different events *en route*, including speed tests, hill-climbs, consumption, etc., and the other category for vehicles which only take part over certain portions of the route, joining at main points, such as Lyons, Marseilles, or Nice.

DURING the coming winter the A.C.F., in conjunction with the Association Generale Automobile, is organising a series of papers on technical questions. They are to be given at the A.C.F. clubhouse in the Place de la Concorde, Paris, the first one—on "Brakes"—being down for October 23.

A TOUR of France, restricted to touring cars, is being organised by "La Vie au Grand Air" as one of the events of the 1904 season.

IN connection with the Paris Salon d'Automobiles, in December next, several competitions are being organised. Among these may be mentioned one for automobile headlights, one for the starting up of engines, and one for the inflation of tyres by means of pumps worked off the engine on the car.

FORTY cars competed in the reliability run held by the Berlin Automobile Club on Sunday, the 13th inst. The day's tour was from Berlin (Wannsee) to Wittenberg and back, a distance of 94 miles, which had to be covered in a minimum of 4½ hours. The result was that twenty-one cars made non-stop runs, so securing gold medals, nine cars which had less than ten minutes' delay en route secured silver medals, five vehicles received bronze medals, while five others failed to secure awards.

AFTER being twice postponed on account of bad weather, the Semmering hill-climb, organised by the Austrian Automobile Club, was run off on the 17th inst. The course is ten kilometres long, during which a height of 400 metres had to be climbed. The best time of the day was made by Braun on Mr. C. Gray Dinsmore's 60-h.p. Mercedes (8m. 47 3-5 sec.), thus winning the heavy-car category. There were only two competitors in the light car class, Hieronymous on a 40-h.p. Spitz was first in 9m. 30 3-5 sec., Barbaroux's time on the 40-h.p. Banz-Parsifal was only 5 sec. more. Maurer on a 5-h.p. friction-driven Union had a walk over in the voiturette class (time, 14m. 37sec.) while Wondrick on a 2½-h.p. Laurin-Klement won the motor-cycle class in 10m. 38 4-5 sec.

SUNDAY, October 18th, is the date fixed for the race meeting to be held by the German Automobile Club on the Trab race-course, Westend, near Berlin. The programme includes a five-mile race for motor-bicycles; a ten-mile race for cars weighing over 600 kilog., and having engines up to 19-h.p.; a ten-mile race for cars of from 20 to 30-h.p.; a ten-mile professional race with cars up to 30-h.p., and a similar event for cars over 30-h.p.

It is reported in Vienna that King Edward has ordered an 18-h.p. Mercedes motor-car from the firm which supplied the car which his Majesty used during his stay at Muriénbad.

MR. LAMB, the Secretary of the Stanley Cycle Show, informs us that 221 firms have definitely taken space, and that he expects to be well ahead of last year's number.

WE understand that Mr. A. E. Perman has resigned his position as manager of the Gladiator Department of Messrs. S. F. Edge, Ltd., and that he will shortly be severing his connection with this company.

MR. CHARLES R. BASE, of High Holborn, W.C., is anticipating the winter season by introducing some novelties in warm clothing, at once wind and waterproof. Just now there appears to be a great run on leather-lined C. R. B. coats, light in weight, and yet possessing the qualities most esteemed by motorists. In Meltons, too, he has a wide range, and owners and drivers of cars in the Eastern counties will be interested in the knowledge that all his motor clothing specialities can now be obtained at Mr. G. Base's, 49, Pitt Street, Norwich.

A NEW DEPARTURE IN SILENCERS.

QUITE a new departure in silencers for petrol motors has recently been devised by Messrs. Webb and Hall and put on the market by Messrs. Geo. Main and Company, of Loughborough. The apparatus is claimed to act not only as a silencer but as a petrol economiser and scavenger. Referring to the accompanying illustrations, it will be seen that within the silencer is a fan or rotar specially constructed and machined to suit the purpose for which it is intended. When the silencer is

Fig. 1.—General View.

in use the fan or rotar revolves rapidly with the force of the exhaust, and in doing so creates a draught down the exhaust pipe, which draws away from the engine cylinder the foulness left after each explosion. It is claimed that this makes each successive explosion more forceful, as the hydro-carbon residue, which always interferes with the incoming mixture, has been drawn away, and that by the same means not only are the valves and sparking plug kept perfectly clean, but an economy in the consumption of petrol is effected. Before being put on the market the

Fig. 2.—Silencer with cover removed to show Fan.

Fig. 3.—Fan Detached.

apparatus has been well tested. We may also mention that while demonstrating it a few weeks ago to a rather sceptical motorist it was decided to take out the sparking plug from the engine head and by placing it into the smoky part of a gas light it was covered with soot and replaced. After the motor-bicycle had been run for twenty miles the plug was again taken out and was found to be perfectly clean, and showing the whole of the white porcelain face. At present the silencers are being made for motor-bicycles with engines of from 1½ to 3-h.p. and for 4 to 6-h.p. motors for cars.

HERE AND THERE.

LORD LATHOM, of Ormskirk, has just acquired a 10-h.p. five-seated Wolseley phaeton.

It is announced that a service of motor-cabs is about to be started at Frankfort-am-Main.

"LE VELO" proposes to hold a number of motor-boat races at Ostend during the course of next summer.

THE Speedwell Motor Company, Limited, have opened a new garage at Jay's Mews, Kensington Gore, S.W.

A MOTOR fire-engine has just been supplied by Messrs. Merryweather and Sons to the Plymouth Fire Brigade.

A SUMMONS against Mr. Cecil Drew for driving his motor-car on the footpath at East Moseley has been dismissed on the payments of the costs.

A NEW oil can which appears to possess several advantages has been brought under our notice by Messrs. Markt and Co. It is known as the "Rochester" automatic self-filling oiler, the feature of which is the use of a spring bottom. Usually, the spout has to be removed every time it is necessary to fill an oil can. With the automatic oiler, the spout is depressed, forcing out the air and causing a vacuum; the end of the spout, while so depressed, is inserted in the oil, which is at once sucked into the

can, taking the place of the air ejected. It is claimed to be impossible to over-fill the can, so that there is no waste of oil. When oil is desired, it can be had in the usual way—by the spring bottom, or if a quantity is desired, it is possible, by again depressing the spout, to force the oil entirely out of the oiler. To fill the can, the spout is depressed, and while in that position the end of spout is inserted in the oil; by releasing the spout by removing fingers from the button, the oiler will begin to fill. Then, while holding oiler with one hand, place the fingers of the other hand above the button, as shown in the illustration. Pull steadily on oiler, at the same time keeping the end of the spout in the oil. When the spout is out to its full length, the oiler is filled. The plunger is formed of two leathers cupped up the same as in a pump. The leather cups are placed between two steel discs and securely fastened by a nut on the end of the tubing.

MESSRS. LANKESTER AND SON, LIMITED, Holy Rood Foundry, High Street, Southampton, have every facility for charging the batteries of electrical vehicle cells, and for undertaking repairs to accumulators and cars.

A NEW garage has just opened in Washington, U.S.A. It is known as the Edison Automobile Station, the moving spirit in it being Mr. W. Leslie Edison, a son of Mr. Thomas A. Edison, the famous inventor.

THE first car built by the Ryknield Engine Company, of Burton-on-Trent, is now complete, and for several days has been subjected to severe tests in the neighbourhood of Burton. The car is of 9-h.p., and comprises a number of new features.

MESSRS. H. B. NELSON have recently opened large premises at 7, Harrington Road, South Kensington, where the special little 6-h.p. Lambert car, for which they are agents, can be seen. Messrs. Nelson have also recently secured the agency for the well-known Rex cars.

A GARAGE has just been opened in Bishopton Lane, Stockton-on-Tees, under the title of "Watson's Motor Garage."

Storage accommodation for twenty-five cars is available, and also two inspection pits and washing facilities. A stock of accessories and petrol is kept, and the garage is open day and night.

A LOCAL Government Board inquiry has been held at Bamber Bridge into an application by the Urban Council for permission to borrow £2,261 for the re-making of the road near Hoghton, between Preston and Blackburn, in consequence of damage caused by heavy motor traffic. The County Council will repay the money, and asked for a long term, as this was happening all over the country.

THE Speedwell Motor and Engineering Company have just brought out a new two-seated petrol car at a popular price. It is fitted with a 6-h.p. De Dion engine and chainless transmission, two forward speeds and a reverse. We also learn that the Speedwell Company have secured the agency for the new Leon Bollee cars, one of which is expected over shortly.

THE Eltham double-deck motor-bus, which we recently illustrated, and which carries 27 passengers, has now covered 9,000 miles on its 3in. Royal Buffer tyres, and only one tyre has yet been renewed. It is needless to remark that the conditions of motor-bus work are much more severe than those obtaining with an ordinary private car, for not only the heavy load has to be taken into account, but also the constant starting and stopping, and continuous daily work.

MESSRS. CHARLES HARMER AND SON, of Lingfield Road, Wimbledon, have sent us a sample tin of a new belt dressing, "Gottim," they have just put on the market in 6d. tins. Unlike nearly all other dressings on the market, "Gottim" is said not to contain resin, treacle, or any other detrimental substance, while another feature is that it never dries. It can be used for the round, flat, or V-shaped belts of motor-cycles, and is applied, not to the belt, but to the pulley.

E. P. ALEXANDER AND SON, Chartered Patent Agents, ask us to mention that although Germany acceded to the International Convention on Patents on the 1st May last, with the result that anyone who has applied for a patent in Great Britain (and other states of the Union) can claim twelve months priority in Germany from the date of the first filed application, no such priority can be claimed in respect of patent applications filed prior to May 1st last, and that in all such cases the German patent must be applied for before any printed publication of the invention has taken place in any country.

THE Auto-Cycle Club, having regard to the new Motor Car Act, which comes into operation on the 1st of January next, and to various ambiguities which exist in regard to motor-cycles under the new Act, propose that the Local Government Board shall be approached by deputation, so that the views of motor-cyclists may be laid before them in order that the suggested by-laws of the Board, so far as motor-cycles are concerned, may be made both reasonable and practicable. The deputation will put before the Board of Trade suggestions with regard to the definition of motor-cycles and their uses, with regard to the size and position and illuminating of numbers, and with reference to the use of trailers and the change of ownership.

ONE of the Lems little two-seated electric cars of the London Electro-Mobile Syndicate has just been submitted to a 350 miles road trial. The route followed was from London to Bath, via Winchester, Southampton and Salisbury, returning by way of Chippenham, Oxford and Reading. Throughout the whole trip not a single mishap occurred, nor were any repairs or adjustments necessitated; no troubles were met with, beyond bad weather and the necessity for frequent recharging. The car is driven by a single motor of about 2 nominal horse-power, through a chain and double reduction gear. Current is furnished by a battery of forty Hart accumulators of a capacity about 48 ampere-hours, or sufficient for a run of from 30 to 40 miles on one charge. The tour was undertaken to prove that a small electric car can be taken without trouble and discomfort for a lengthy tour through the country, and yet not be stranded anywhere beyond reach of a charging station.

CORRESPONDENCE.

AN "ACT" OF DISCOURAGEMENT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have to thank Mr. Staplee Firth for his letter in your issue of the 19th inst., and for his kindly references to myself. I hope he will not think me discourteous if I ask him to be so good as to point out what "foundations" in my article of criticism of the "Act" in your issue of the 12th are "imaginary" and "never did exist."

If I read him aright, he seems to think that my criticism implies that I most ungraciously ignore the Legislative Committee and its work, and that I seem to think it has done nothing. Far be it from me to make light of the great amount of time and trouble some of its able members gave to the matter. I am sure there is nothing in mine to lead anyone to think I have forgotten their arduous and well-meant efforts. The thing I do complain of is that anyone should say "the Club" was in favour of numbering, etc., when the Club was given no opportunity to discuss the matter till too late—when the Government had a Bill ready. Also I feel that "the Club" as a whole was misled—I do not mean intentionally—because we were lulled into a sort of grumbling quietude as to the Legislative Committee's Bill, because we were told numbering, etc., was the only way to get rid of the twelve miles an hour, etc.

Now we are told that the committee (Mr. Firth calls it "the Club") wanted numbering, etc., in order to get rid of the "road hog." I venture to say that had the Club dreamt that its committee was giving up a primary principle of private liberty, and going so far out of the proper duties of a Club as to help the police and other proper authorities to look after a very commonplace class of offender, the voice of the Club would have found some way to make the committee return to more useful and proper business.

It is just because this committee went on such weak and false lines that I rake up the past as a lesson for the future. We don't want the safest form of traffic and that which is best for the general welfare, and certain also to be the preponderating one, apologised for, made the subject of compromises, or lowered to the level of the mutual relations between the police and the "road hog."

It is manifest, since even the Government was only able to find time to force an undigested Bill through Parliament at the far end, that the Club could have prevented any legislation at present if it had not gone out half-way to meet the enemy; with not only no army, but impeded by a load of compromising efforts. The Government were encouraged to think the automobilists would not do anything, but be meek and tractable.

Had the Club a year ago organised a strong Parliamentary automobile party; refused to be led into any compromises; let it be known (in the words of the Scottish Automobile Club) that "it would watch jealously any attempt to alter the present law"; and above all stuck to the point that uncompromising opposition would be given to any attempt to put the users of private carriages of one class on a different plane of freedom—then such a party should have been strong enough to prevent the Government rushing into anything like this. Delay was of more importance than anything else.

When I read my criticism in print, I was afraid my friend Mr. Firth would be annoyed with me for saying that in the eyes of the enemy he was a "road hog" himself. What I meant was that in the eyes of the average M.P. or J.P. of England, and his like, any sort of speed or any sort of motor-car (in some cases even crawling ones) was a thing accursed, and hence the owner and the driver a "road hog." It is not a question of care or courtesy, but of sheer hatred bred of ignorance, false conservatism, and a dense type of self-satisfied mind. These people talk of the whole thing as abominable, and now Parliament has given them the pull in every sense, and stamped us with that brand of special sin which we were made to seem to ask for. Mr. Firth should have known these folk best of all, and I willingly assume that he did not agree with the whole childlike and bland methods of the Legislative Committee.

He must have known that with telephones and telegraphs, once you put identification on cars, it would be child's play to sit in a window by the instrument, note a number and the "hour, minute, and second," and passing it on to the other observer a few miles off, be able to calculate the speed and prove the case, and identify each car with ease. There are certainly lively times ahead, and the battle will only be the fiercer. Had we sat tight and worked hard for delay, delay, delay, and for principles, things would have righted themselves quicker, and without the great injustice and annoyance and hardships which are now made certain by this Act, and the encouragement it gives directly and indirectly to the reactionaries.—Yours truly,

NORMAN D. MACDONALD.

NON-PUNCTURING BANDS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to "Progressive's" letter in a recent issue re Wheeldon's steel bands, I have been using these bands in my tricycle tyres (2½ by 2½ in.) for upwards of 500 miles. I took out the bands recently and carefully examined the inner tube, as well as the fabric of the covers, for signs of wearing through of the small metal plates, but

could find no traces of wear whatever, and I replaced the bands with perfect satisfaction. When they were first put in I expected they would slow the motor-cycle a little uphill, but I find that if anything the machine, which is only a 2½-h.p., by the way, climbs hills faster and better than before the bands were fitted.—Yours truly,

FRED B. CAWOOD.

QUERIES FROM CEYLON.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be much obliged if you would give me your opinion as to what form of small motor-cars would be suitable for this country (Ceylon). The roads are as a rule very good as regards surface, but in the central part, which is the chief planting district, the roads are very steep, in some cases one in six or seven, and the corners are very sharp, as the roads have to zig-zag up the faces of the hills. A pace of more than four miles an hour would be impossible round these corners, and on the level roads more than twelve miles would not be safe owing to the dogs, buffaloes, cattle, natives, etc., that always seem to wander across the road just when you want to go by. There are no doubt many men in the Government service, particularly road officers, who would be only too glad to get a cheap car that would do the work, but they must climb anything, have solid tyres and tube or magneto ignition. Electric batteries do not stand the climate well. I frequently see in your valuable publication, to which I am a subscriber and a very interested reader, a number of second-hand 3½-h.p. geared Benz cars very cheap; would that type be suitable? Air-cooled motors if geared low would get too hot out here.

The only motor bikes in Ceylon are 2 and 2½-h.p. Neckarsulmers (German), selling at £40 landed here. There is also one Quadrant. There are also three early type Locomobiles and one Weston.—Yours truly,

PROMOTORIST.

THE SPEED OF TRAMCARS.

MR. MOFFAT FORD has applied to Mr. Lane, at the West London Police Court, for directions in the matter of the summonses he had issued against several drivers of the London United Tramway Company for exceeding their legal speed limit. Although a month had elapsed since the last adjournment, and although a referee had been agreed upon between the parties, yet he could not obtain an appointment for the test from the defendants, who did not seem at all anxious to hurry the matter forward. The magistrate remarked that Mr. Rose, before whom the previous hearings had been, would return very shortly to the court, and he had no doubt that before that time the defendants would come to some arrangement for the official test to take place in ample time for the case to be continued immediately Mr. Rose recommenced his sittings at the court.

POLICE TRAPS.

AMONG Hampshire traps, that on the Havant-Emsworth road seems to have been successful lately in bagging unsuspecting motorists.

ON Sunday the police laid a trap for motorists in Maidenhead on a stretch of road between the top of Castle Hill and Punt Hill. The starting point of the trap is in the gateway of a house directly opposite the 27th milestone from Hyde Park Corner. The policemen who signal and time cars are dressed in plain clothes and hide in gateways, and at some little distance at each end of the trap are men in uniform.

INSPECTOR MARKS, who formerly distinguished himself at Weybridge, is now located at Hersham. We understand that the neighbourhood is being honeycombed with measured distances, which will doubtless enable the police to capture motorists.

AT the bottom of the hill, just outside Knowle, Warwick, there is a police trap, in which several motor-cyclists have recently fallen victims.

AT Foston, on the Great North Road, is a measured distance of 700 yards, 570 of which are through the village street.

MOTOR-CAR LICENCES.

MR. ARTHUR BOHRINGER, of Alfred Street, Brompton Road, S.W., was summoned at the Westminster Police Court, on Saturday last, by the Inland Revenue for keeping motor-cars without a licence. Counsel for the Excise said it was a peculiar case. Defendant had a coachhouse at Thurloe Mews, South Kensington, and on a day in April an Excise officer found three motor-cars there. Defendant admitted the ownership of one, and said the others belonged to friends whose names he would not give. It was for him to satisfy the Inland Revenue Commissioners that they belonged to someone else, for, *prima facie*, "keeping" meant ownership. After intimation of proceedings, defendant did furnish the names of persons as owners of the cars. There was a long correspondence, and it was admitted that licences were now in existence. Mr. Sheil said defendant seemed to have shown much contrariness. A solicitor remarked that he did not justify that, but the Excise officer

only saw defendant's son. Defendant gave evidence, and Mr. Sheil dismissed the summons as the offence was not proved. Defendant's solicitor asked for costs against the Excise. Mr. Sheil: Certainly not under all the circumstances. I am only sorry I cannot make the defendant pay the costs.

Ashford	G. Waldren, Endsleigh Gardens, W.	20	£10, etc.

Where no alleged speed is given it is understood to be above the legal limit.

JOSEPH HUTHART, who was summoned at Carlisle for riding a motor-cycle at a speed greater than was reasonable and proper, having regard to the traffic at the time, told the Bench that they would not be troubled with him again, as he had just advertised the machine for sale. Such an assurance, however, did not prevent him being fined half-a-guinea and costs.

ALFRED CLEMENTS, of Norfolk House, Norfolk-street, Strand, was summoned at Guildford for driving a motor-car at Witley, at an excessive rate, on August 30th. Sergt. Baker deposed to timing the speed of the car over a measured distance, and it worked out at a rate of over twenty-one miles an hour. After he had been stopped defendant went back and cautioned the drivers of other cars coming along.—Defendant, who denied having been travelling more than ten miles an hour, was fined £3.

WHAT IS A PROPER DEPOSIT?

At the Marylebone County Court (London) on Tuesday, before Judge Stoner, Mr. John A. Tessington, of Derby, brought an action against Mr. H. P. Salsbury, of Kensal Rise, N.W., claiming the return of a deposit of £10 paid on making a contract for the purchase of a motor-car; also claiming £5 as damages for alleged breach of contract and 5 per cent. interest on the deposit from 9th July last. The plaintiff stated that he had arranged to purchase a motor-car from the defendant, and paid a deposit of £10. Some question afterwards arose, however, as to

the cooling apparatus and the radiator to be supplied; and as the car was not supplied as arranged, he considered that the defendant had broken the contract, and that the transaction was "off."

The defendant stated that the plaintiff had never paid a proper deposit, for it was a custom in the trade that a deposit in respect of a purchase should be one-third of the price of the goods, and handed in several catalogues to show that the custom of the trade was as he stated.

The Judge said that, as there was no proper written agreement, it was impossible to say exactly what the contract really was. From the correspondence, however, it appeared that the defendant had been anxious to meet the wishes of plaintiff in a reasonable way, and his Honour thought defendant might still supply the car. He adjourned the case for a month, so that defendant can put in the radiator that the plaintiff desired.

CLUB NEWS.

SHEFFIELD.

DESPITE the wet morning about twenty members of the Sheffield and District Automobile Club carried out the Chatsworth meet on Saturday, and spent a most enjoyable afternoon. The Derbyshire roads were in fair condition considering the rain, but the mist was so thick over the moors on the return journey that it necessitated extreme care in driving. Amongst the members present were Messrs. B. H. Gainsford, E. F. Coupe, J. H. Pickford, J. Ellis, J. E. Evans, Jas. Barber, E. H. Hill, D. H. Bookless, A. Blyde, H. A. Hobson, F. J. Fryer, G. D. Flather, E. H. Hill, H. Hill, J. Walker, and the hon. sec., F. B. Cawood.

THE SCOTTISH AUTOMOBILE CLUB (WESTERN SECTION).

A Club meet took place at the Clachan of Aberfoyle on Saturday afternoon last. The gathering comprised twenty-nine cars, including the following types:—Argyll, Albion, Arrol-Johnston, Babbie, Darracq, De Dion, Gillet-Forest, Gladiator, Lanchester, Panhard, Progress, Renault and Wolseley. The roads were in capital order, and the day being fine, the majestic scenery surrounding the little Highland hamlet was viewed to the best advantage. After tea at the Bailie Nicol Jarvie Hotel, many of the cars were driven to the shores of Loch Ard and of the Lake of Menteith and other interesting and picturesque spots in the neighbourhood. The following were among those present: Messrs. John Adam, chairman, Fred Lobnitz, Jas. Anderson, J. W. W. Drysdale, Wm. Robertson, J. Hunter Steen, Robert J. Smith, hon. secretary, L. C. Seligmann, S. G. G. Copestake, J. Cameron, Jas. Gramb, Geo. Owen, John F. Henderson, Buchanan, John Motherwell, W. H. Steen, Hugh Reid, G. H. Christie, Dr. Wm. Grant, H. M. Napier, H. W. Brock, Provost Kennedy, Dr. Kirkland, W. Babbie, W. McOnie, H. Prosser and R. J. Deany.

WHIPPING A MOTORIST.

At a meeting of the Carrick District Committee of Ayr County Council a report by the surveyor suggesting that the speed of motor-cars passing through villages should be restricted to ten miles an hour, and that notice boards with that intimation should be erected at reasonable intervals along the highway, led to an interesting discussion between the Marquis of Ailsa and Mr. Robert Inglis, factor to Colonel Dalrymple Hamilton, of Bargang. The Marquis observed to Mr. Inglis, "You have some experience of motor-cars?" whereupon the following colloquy occurred:—

Mr. Inglis—I have been nearly killed two or three times; I expect I will be killed some day.

Lord Ailsa—When was the last occasion?

Mr. Inglis—On Saturday last.

Lord Ailsa—How did it occur?

Mr. Inglis—I was going round a corner, when a motor came past at a speed that would have frightened any horse, and made it turn right in front of the motor.

Lord Ailsa—Did your horse do that?

Mr. Inglis—No; I was driving a very quiet horse, but any horse might have done so.

Lord Ailsa—Did you recognise any of the occupants of the car?

Mr. Inglis—No, my Lord.

Lord Ailsa—Well, as it happened, I was in that car, and it was running at a very reasonable speed, having come up a hill and having been checked by a vehicle which had taken the wrong side of the road. Did you, Mr. Inglis, strike at the driver with your whip?

Mr. Inglis—I believe I did.

Lord Ailsa—Yes, you hit him over the head with your whip, and knocked his hat over his eyes—a most unwarrantable thing to do, and one which might easily have caused a serious accident.

Mr. Inglis—I did not recognise anyone in the car, my Lord. I was driving a young horse that had never seen a motor before, and I was very much agitated. I am very sorry, my Lord, that such a thing should have happened.

Lord Ailsa—The whip curled over Lady Ailsa's head and mine. Such an action was a gross breach of the law. I was not quite certain of your identity, but now that I have got confirmation I propose to write to your employer, Colonel Hamilton.

THE Motor-Car Journal.

VOL. V.]

LONDON, SATURDAY, OCTOBER 3, 1903.

[No. 239.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE committee of the Yorkshire Club have arranged for suitable headquarters in Leeds and Bradford, having come to an agreement with the management of the Great Northern hotels in both cities. In Leeds, there will be a large comfortable room on the first floor, No. 19, entirely for the use of members. This will be open all day, and there will be kept club papers, books of reference, information of general use to members, and notices relating to other clubs. The hotel is situated adjoining the Great Northern Railway and Lancashire and Yorkshire Railway Stations, and there is a covered way where cars may be left, also the key of a garage at which members' cars may be left free, day or night, will be kept at the office. It is intended, during the winter, to have lectures, lantern lectures, and papers, as well as social evenings, full notice of which will be given later.

1904 to be a Four-Cylinder Year.

IN casting about to judge what will be the characteristic changes in American-made cars for 1904, it is found, remarks one of our transatlantic contemporaries, that the tendency is still setting toward the adoption of European patterns and methods. Larger and more powerful cars will be the rule, with the hooded engine in front, honeycomb radiators, and more capacious and luxurious tonneaus. The one thing above all others that impresses us is the almost unexceptional movement toward the introduction of four-cylinder engines in touring cars. Nearly every concern that has hitherto made a one, two, or three-cylinder touring car will next year present one with four cylinders, and a number of makers who have not hitherto turned out a touring car will next year offer such a model with a four-cylinder engine. The four-cylinder touring car can even now be predicted to be the main type of American car for 1904.

Local Exaggeration.

ON the occasion of the Reliability run to Worthing on Monday week, it was noticed, on going into Leatherhead, that workmen were laying down new stones, and that the steam roller was at work. From a local source we learn that, at great trouble and inconvenience to themselves, the men were good enough to keep the stones quite close to one side of the road, so that the automobiles passing through had a clear run without undergoing the uncertainty with which they always ride over newly-laid metal. Unfortunately, this fact was hardly appreciated by some of the passengers on the cars, and local complaints are being made that, instead of a word of thanks, considerable abuse was hurled at the men as the vehicles passed. We, however, believe that there is some little exaggeration in the local view, so far as the general character of the condemnation which was bestowed, and a few isolated cases must not be taken as the universal expression of opinion.

Main Roads.

THE Departmental Committee appointed recently by the President of the Local Government Board is rumoured to have considered some new ideas with regard to the maintenance of the great main roads of the country. It appears that in London alone there are twenty-nine highway authorities, and 1,855 throughout the rest of the country. According to report, the committee is likely to recommend that the great roads, such as the North road and the Bath road, should be taken over by a new department of the Government, and maintained at the national expense. There is much to be said for a proposal of this sort, which would have the advantage of securing something like uniformity in the road service, provided, be it understood, that the local authorities of the various areas through which it passed should have power to make urgent representations to the national department whenever any laxity occurred, for this latter quality seems inevitable in every Government undertaking.

Water for Cars.

AT the time of the Exhibition at the Agricultural Hall in the spring, when the presence of so many different types of heavy vehicles at that great display served to bring this particular aspect of the question to the front, some discussion took place as to whether local authorities should not place water troughs in the streets with a hose attachment, with which to supply water to the tanks of heavy steam vehicles. At present, the drivers of such vehicles, unless they happen to know the district through which they are travelling, are often in a quandary with regard to this. If local authorities would give the matter their attention, they would not only be serving the interests of the public, but might also be able to do this at no loss to themselves.

America's Reliability Trial.

FOLLOWING close on the heels of the Reliability Trials at home, is the Endurance Contest of the American National Association of Automobile Manufacturers, which commences on Tuesday next. Instead of each day's run starting from the same place, the trial will start from New York and be continued from town to town, until 793 miles have been covered. The contest will extend to the 14th inst., the stopping places at the end of each day being Pine Hill, Birmingham, Bath, Buffalo, Erie, Cleveland, Youngstown, and Pittsburgh. Three different States will be visited, and consequently each car will have to be equipped with a New York, New Jersey and Pennsylvania licence.

Derby and District Club.

THE last run of the season in connection with the Derby and District A.C. has taken place. There was a gathering of sixteen cars at the rendezvous in Vernon Street, these being joined by five or six more either on the way to or at Sudbury. A short run had been chosen on this occasion on

account of the rapidly-decreasing length of evening available after tea. The cars left Vernon Street at half-past two, and proceeded by way of Friar Gate and Stafford Street on to Utttoxeter Road. Shortly after passing Hilton the motorists were advised of the presence of a police trap, so for the space of a mile or so the progress of the cars was limited to a crawl. Arrived at Sudbury the cars were stabled at the Vernon Arms, and then the members of the club and their friends, at the kind invitation of Mr. Gretton, proceeded to view the house and stroll in the well-kept grounds of the hall. A very pleasant hour was thus spent, after which the party returned to the hotel, where an excellent tea awaited them.

Some of the Members of the Reading Automobile Club at Wallingford.
Photo by [Mr. A. E. Newton.]

The Reading Club.

THE fifth and final monthly run in connection with the Reading Automobile Club's challenge cup competition for 1903 took place on Wednesday last week, under extremely favourable meteorological conditions. Leaving Reading at 2 p.m., the route lay along the main Oxford road as far as Littlemore Station, and thence to Wallingford, *via* Chiselhampton and Warborough, then back to Reading *via* Streatley and Pangbourne. A halt was made for tea at the George Hotel, Wallingford. The landlord of this hostelry, it may be mentioned, does everything in his power to make motorists comfortable. Those taking part in the run were:—Dr. A. C. Major (Baby Renault), Mr. C. Dodd (8-h.p. Renault), Mr. A. C. Bremerton (10-h.p. Georges Richard), Mr. A. E. Pocock (8-h.p. Dennis), Mr. C. H. Smith (10-h.p. Clement), Dr. Truman (2-h.p. Clement-Garrard), Mr. J. V. Moinet (2½-h.p. Bradbury), and Mr. Arthur Phillips (Royal Enfield).

Hotel Keepers and Motorists.

THAT some hotel keepers regard motorists somewhat in the light of multi-millionaires has long been apparent to those accustomed to tour among the chief holiday resorts of Great Britain. In Ireland, too, there was a great outcry against the same sort of thing; in fact, it seems to crop up whenever any considerable number of motorists are likely to gather together for the purpose of furthering the industry, or of indulging in two or three days' pastime. The Victoria Hotel, Southport, is the head-quarters of the Automobile Club for the purpose of the Southport trials, and has been obliging enough to offer a "suite of two rooms, bedroom and sitting-room communicating, on the Front for the two days of the motor races, the price of the rooms being five guineas per day." On other days, we are

informed, ordinary tariff prices will be charged. If this is a fair sample of the way in which hotel proprietors are going to cater for motorists when race meetings are arranged at such places as Southport, we can only say that very few meetings of the kind will take place. Such a gathering as that now in progress is likely to bring a considerable influx of visitors into a town, and the fact that all the hotels are full should be enough for the local proprietors, without seeking to repel them by such terms as those we have quoted.

Hampshire Busybodies.

AFTER the way in which the police of Hampshire entertained motorists passing through their district on the occasion of the Reliability run last week, we are not surprised at anything of an anti-motor character which comes from that county, which, it was generally supposed, was a kind of miniature Paradise for motorists. The Petersfield District Council and the Alton District Committee are both recommending the Hampshire County Council to schedule all the roads in their respective areas at the ten mile limit. This would practically prevent motorists getting to Winchester at all, and it is to be hoped that, should the County Council not have the wisdom to reject such a proposal, the Local Government Board will turn a deaf ear to the suggestions of these local busybodies, who would, apparently, encircle themselves with a barrier of prejudice to all the out-side world.

Closing Roads.

TRAVELLING over the Hog's Back and along some of the Hampshire roads, we could not fail to notice how the 16 feet clause will seriously affect the traffic of motor cars, as is pointed out in our article on another page. Some 16 or 17 feet now covered with grass might be easily preserved for traffic purposes, and the actual roadway increased by that extent. Instead of closing roads, the local authorities will be better advised to widen the present roadway service as far as possible, so that the great highways of the country may be put to their legitimate purposes.

A Friendly Lift. A Sketch from Life at Maldon, Essex.

The M.V.C.

THE Motor Volunteer Corps apparently had a hard time during the recent manoeuvres, and, as usual, a few complaints, mainly due to thoughtlessness or lack of organisation incidental to a first appearance, have reached us. Certainly there does seem, as Earl Russell pointed out, a large proportion of officers to men, and it is a pity that gentlemen of good social

status should be employed mainly as coachmen to officers who do not always recognise the service which the amateur motorist is rendering the country by placing his vehicles at the disposition of the military authorities. Undoubtedly most of those employed during the manoeuvres found themselves with a monetary loss, for the allowance of 30s. and free petrol by no means covered expenses involved, to say nothing of tyres, wear and tear, etc., which, to many of those taking part, was a fairly considerable item. Still, we must not be too critical, for the venture is entirely an experimental one, and the faults which were apparent at the recent manoeuvres need not occur again if the military authorities show themselves capable of learning the lessons that they taught.

Carriages v Motors.

At the recent meeting of the Institution of British Carriage Manufacturers at Sheffield, reference was made to the motor industry, Mr. G. J. Jacobs, of Guildford, reading a paper on the subject. He said that in some districts carriage builders were being treated unfairly, owing to their clients being deprived of the comfortable use of the roads and luxury of using horse-drawn carriages, and pointed out that it was a fact

so far as the more modern people are concerned, it seems to us that the duty of carriage builders is to study the motor-car in its various aspects, and try and produce bodies adaptable to the new means of locomotion—otherwise they may expect to be left behind in the race.

Dust Laying.

NEAR the Tuns, on Salt Hill, Slough, on the Bath road, an experiment has been in progress for some weeks with a view of abolishing the dust nuisance caused by motor-cars. The plan adopted has been to sweep the road clean of all dust and fine gravel, then to cover it with a coating of hot tar applied with a brush. One length of road has been left for the tar to soak well into it, but without anything being spread over it. Another portion has had fine gravel thinly spread on the tar. Up to the present the dust has been reduced quite seventy-five per cent., but the expense incurred, and the length of time a single dressing of tar will last, is as yet a matter for conjecture. So far it has proved successful. Another aspect of this experiment is that all the dust that was swept off the road, together with the dried mud along the sides, has been shovelled

Photo by)

The Star or the Reliability Run to Worthing.

[Argent Archer

that many ladies, who, less than two or three years since, would have suffered a severe neurotic attack had they been subject for a single hour to the vibration of a loose window in a brougham (however well built), could now be seen enjoying on motor-cars an amount of rattle, vibration, and discomfort that suggested that up to the present time the motor-car had not been dispassionately judged by the same standard of comfort that had been the gauge of its predecessors. Would this always be the case? When the evidence has accumulated on the motor side, and the verdict was given, then on this and on other grounds, the horse-drawn carriage would still hold its own, and the speed and excitement of a motor-car ride would be held to be no substitute for the luxury, comfort, and benefit of the carriage drive.

The Proper Policy.

SUCH was the sanguine view of Mr. Jacobs, although we are afraid he is taking a rather too roseate view of the situation, so far as his own trade is concerned. Carriage builders must not become anti-motorists, but rather adapt themselves to the changing circumstances of the time. There will always be people who prefer the means of locomotion adopted by Adam and other ancient heroes to the up-to-date motor-car, and for them carriage builders will, of course, continue to cater; but,

on to the footpath to a depth of from one to three inches, and already has made it anything than clean and pleasant to walk on; but how this will be in wet weather, with the dust turned into mud, is too serious to contemplate.

The Southport Speed Trials.

THE Reliability Trials over, the eyes of the automobile world are now centred on the Southport speed trials, which are taking place on Friday and Saturday of the present week. The list of entries, which is a large one, has come to hand too late to allow us to reprint it in the present issue. We may state that the motor-cycle section is divided into four classes, the distance to be covered being seven furlongs. In Class A, for machines up to 114 lbs. in weight and with engines 70 mm. by 70 mm., there will be eight competitors; in Class B, a handicap race for machines up to 170 lbs., and motors 84 mm. by 84 mm. there are no less than 22 entries. Class C is for Lancashire riders of machines similar to Class B, and has brought out a baker's dozen of competitors, while in Class D, for machines of any capacity, but not exceeding 170 lbs. in weight, there will be seventeen starters. Coming now to the Fouring Car section, all the races will be over a kilometre course with a flying start. Class E is for cars under £200, and will be

competed for by twelve drivers, Class F, cars between £200 and £400 has brought forth 18 entries, and Class G cars between £400 and £550, eight. In Class H, vehicles between £550 and £750, there will be fourteen competitors, including a new car—a 24-h.p. Newton-Pearce. Class J, cars between £750 and £1,000, has brought out two De Dietrich's, a Brush, a M.M.C., three C.G.V.'s, a Gobron Brillié, an Ariel, and a Fiat. In Class K., cars over £1,000, the entries comprise a 24-h.p. and a 15-h.p. Panhard, a 20-h.p. Mercedes, and two 20-h.p. Napiers. In the Lancashire Inter-Club Handicap, Class M, nineteen vehicles will compete. The Racing Section comes next with three entries in the light-car class (N) and eleven in the under 1,000 kilog Class (O), the latter comprising a Gordon Bennett Napier, driven by Mr. S. F. Edge, Mr. Higginbotham's 60-h.p. Mercedes, Mr. J. Talbot Clifton's 70-h.p. Panhard, the Star Racing Car, Mr. Andrew Fletcher's 60-h.p. Mercedes, Mr. Harvey Du Cros, Jun.'s, 30-h.p. Panhard, Mr. J. E. Hutton's 70-h.p. Panhard, the Hon. C. S. Rolls' 70-h.p. Mors, Mr. H. Austin's 36-h.p. Wolseley, Mr. A. Fletcher's 40-h.p. Mors, and Mr. R. L. Lloyd's 35-h.p. Napier. The scratch race for cars under 1,000 kilogs. (Class P) has brought thirteen entries, the bulk of which are also in Class O, while the final race, for cars of any power or weight (Class Q), will also be another battle between twelve giants. We may add that it has been decided not to use the Winter Gardens at Southport as the official garage during the Speed Trials. The proprietor of Gandy's Riding Stables, Roe Lane, Southport, has kindly undertaken to afford free garage accommodation to competitors.

Footpaths.

THE Vicar of Westham, near Pevensey pleads for footpaths on the side of roads so that pedestrians may escape from what he terms "the motor pest." This is a reasonable suggestion, and should commend itself to all having anything to do with the management of our main and side roads. At the same time, we do not want to see these footpaths extended to widths of eight to ten feet, thus assisting the Local Government Board to close the roadway under the provisions of the new Act.

Track Racing in America.

Two persons injured at Cleveland, one killed at Detroit, one killed at Milwaukee, and five injured at Zanesville, O., is the record of one week's automobile track racing in America. The accident at Cleveland, due to the "Torpedo Kid" running off the track, was referred to in our last issue. The Zanesville calamity was caused by the bursting of a tyre owing to the strain on the wheels when the car was rounding the curve at a speed of forty miles an hour. The driver, strangely enough, escaped with a shaking. At Milwaukee the accident occurred in an attempt against record on the Ford-Cooper racer. After covering 3 miles in 3 min. 15 sec., the driver suddenly lost control of the machine on one of the bends, the car dashing into the fence. Fortunately the spectators were able to get out of the way, but Day, the driver, was so frightfully injured that he succumbed without regaining consciousness.

Time to Stop.

WITH such a terrible record as this, it is nearly time that a stop was put to this dangerous sport, at least until tracks specially designed and constructed for high speed automobile racing are available. Those who control the sport of motor racing in the United States are face to face with a serious situation, and on their quick action much depends. Without blame upon anyone, the accidents have simply occurred to mark the limit of safety in racing on existing tracks—to accentuate the fact that speeds of sixty miles an hour on horse race courses have passed the boundaries of security. Track racing under proper conditions is no doubt an interesting sport and will long remain so, but a halt in the interest both of the sport and industry must

now be called. Not only must special tracks be provided if the sport is to be continued, but the rules regulating track races should be immediately amended so as to prevent the appearance of such racing monstrosities as have lately seen the light on the other side of the Atlantic.

Irish Automobile Club.

A VERY successful hill-climbing competition, under the auspices of the Irish Automobile Club, was carried out on Saturday last at Glindoo Hill, near Dublin. The distance of the event was three-quarters of a mile, and the average gradient was one in twelve. A dozen members entered for the trial, and all of them, save one, successfully ascended the hill. The winning car was a 12-h.p. Napier, driven by the popular president of the club, Mr. W. G. D. Goff, who came up from Waterford to take part in the event. Mrs. R. J. McCreedy, the wife of the hon. sec., drove her 6-h.p. De Dion, and not only made much better time than the two similar cars entered, but had the satisfaction of beating the times of most of the higher horse-powered cars. The result was as follows:—

		min.	sec.
W. G. D. Goff ...	12-h.p. Napier ...	5	1
W. Sexton ...	10-h.p. Siddeley ...	5	11
L. J. O'Higgins ...	10-h.p. Gladiator ...	5	11
Mrs. R. J. McCreedy ...	6-h.p. De Dion ...	5	35
C. W. Hely ...	10-h.p. Panhard ...	5	38
R. J. McCreedy ...	10-h.p. Siddeley ...	5	42
Hayes ...	10-h.p. Wolseley ...	6	33
Lord Plunkett ...	10-h.p. Lanchester ...	6	57
J. O'Connor ...	6-h.p. De Dion ...	7	28
Dr. Wright ...	6-h.p. De Dion ...	7	47
Westley ...	15-h.p. Belsize ...	9	3

Technical Education.

FOLLOWING our reference last week to technical instruction facilities in connection with motor-car work, news comes of developments at St. Martin's School of Art, London, W. During the coming session a special course of instruction will be given on the building of the best types of carriages driven by electricity, and drawings will be made of bodies for various motor frames.

THE Wolseley Co. have just delivered a 50-h.p. car with tonneau body and canopy to Mr. Harvey Foster, of Battle.

THE Western Road Carrying Co., Limited, have established a garage in the Victoria Road, St. Philip's, Bristol, which was formally opened on Tuesday.

FOR the 1904 season the Minerva motor will be made in three sizes, 2-h.p. (69 mm. cylinder 70 mm. stroke) 2½-h.p. (76 × 76), and a new 3½-h.p. (82 × 82), all being fitted with mechanically operated valves.

MISS MURISON has established a record by being the first of her sex to drive a motor-car (an Arrol-Johnston) from Land's End to John-O'-Groats. The run commenced on the evening of Tuesday, the 22nd ult., and John-O'-Groats was reached on Monday last. The running averaged 180 miles per day, and the longest drive in one day was 213 miles.

THE Vulcan Motor Manufacturing Company, Limited, write:—"We note from your Reliability Trial table you only give the word 'collision' as the cause of the withdrawal of our 6½-h.p. Vulcan car. As the records show that up to the accident the car did very well until within twelve miles of the Crystal Palace, on the return journey from Eastbourne, we should be glad if you would allow us to give you the facts. When our car was passing between a non-competing vehicle and a dray, a cyclist came right in the path of the car from behind the other vehicle. Our driver, to avoid running down the cyclist, turned his car into the dray, with the result that the front arm and spring of the car was fractured, the silencer broken to pieces, the gears affected, and our observer thrown out over the bonnet of the car. After this the vehicle was driven slowly to the Palace, where it was decided to withdraw from the Trials."

THE HINDHEAD HILL CLIMB.

THE run to Southsea on Wednesday of last week included a timed run up the well-known Hindhead, a few miles beyond Guildford. The climb was two miles in length, the average gradient being 1 in 24.4 and the worst stretch 1 in 13. The cars were stopped just before the beginning of the ascent, and had a start, commencing on a slight down grade, of about 150 yards. The following table shows the times of the twenty fastest cars:—

No.	Car.	Time. m. s.	No.	Car.	Time. m. s.
105	10-h.p. Gardner Serpollet	3.32½	91	12-h.p. De Dion	5.12½
133	20-h.p. M.M.C.	4.33	134	16-h.p. Fiat	5.13½
114	14-h.p. Martini	4.41½	116	10-h.p. White	5.16
120	16-h.p. Rochet-Schneider	4.42½	129	15-h.p. Pipe	5.20½
100	18-h.p. James & Browne	4.47½	106	24-h.p. Georges Richard	5.22
137	22-h.p. Daimler	4.53	127	15-h.p. C.G.V.	5.22½
102	24-h.p. Wolseley	5.0½	92	12-h.p. New Orleans	5.23½
120	20-h.p. Germain	5.1	66	12-h.p. Gladiator	5.30½
140	24-h.p. De Dietrich	5.5½	108	16-h.p. Dennis	5.38½
97	15-h.p. New Orleans	5.11	118	24-h.p. Darracq	5.43½

The return journey was made by the same route, and was marked by a couple of incidents, both unexpected by the competitors. Near the foot of Hindhead the cars were stopped and examined as to their condition by three of the judges, after

which they were despatched one by one. Just as they were beginning to get into swing again down the slope, on rounding a corner, flags were suddenly displayed from the hedges. It was a surprise brake-trial, the results of which are not to be made public. The judges have, however, expressed their satisfaction with the power of control exhibited. The remainder of the journey was uneventful. The inspection by the judges caused some delay, and a light fog made travelling in the dark troublesome, so that it was somewhat late when many of the cars reached the Palace.

THE second trial of cars claiming to have been impeded at Westerham on the Eastbourne run took place on Monday last with the following result:—

No.	Car.	Time. m. s.	Speeds in miles per hour.
105	10-h.p. Gardner-Serpollet	1.39	22.23
130	16-h.p. Rochet-Schneider	2.32½	14.44
140	24-h.p. De Dietrich	2.33	14.36
66	12-h.p. Gladiator	2.46½	13.23
127	15-h.p. C.G.V.	3.8½	11.68
100	18-h.p. James and Browne	3.11	11.52
126	16-h.p. De Dietrich	3.21½	10.92
17	5-h.p. Oldsmobile	4.51½	7.55
57	12-h.p. Georges Richard	5.15	6.97
19	6-h.p. Elswick	8.22	4.38

THURSDAY—TO BEXHILL.

ON THE FIRST CAR TO THE FRONT.

THURSDAY'S run was one of 121½ miles, the destination being the new and ambitious seaside resort of Bexhill—an aggregation of villas and boarding-houses, planted between the water and the railway station. There was plenty of excitement in the morning conversations ere we bade farewell to Mr. A. Burgess, who was keeping a weather-eye upon the couple of representatives of the Motor Manufacturing Company in the trials. Our mount was not the little single-cylindereed vehicle that made non-stop runs throughout the Trials, but the big 20-h.p. brother, which would

of such a prominent position is that one does not see the laggards; cars may fall by the roadside or become modestly slow, and those in the first cars see nothing of the consternation that comes over the faces of drivers when pressmen come in view. The route to Tonbridge had already been traversed by all the cars on the run to Eastbourne, and except for a gipsy encampment with straying horses about the road, there was little of interest. Beyond Halstead the programme warned drivers to go slowly, as children were often playing in the road at the foot of the hill, a fact we noted, although it had no existence in actuality at that early hour. Sevenoaks was being awakened as we rushed through, and then pace slackened beyond Hildenborough, where Mr

The Trapper Discovered.
A SUSSEX POLICE TRAP.

Snapped!

have been equally successful but for the ignition troubles (caused by the quality of the spirit used) which came upon the car after leaving Bexhill. But that part of the story must be told later. Mr. George Iden was at the wheel, keeping a firm and paternal hand on the way of the car. Mr. Spencer acted as Observer, and, packed away in the tonneau, were the mechanic, a fellow-journalist, and the writer—the latter a useful kind of ballast, wisely shed when the car went upon the track to make the fastest time of the day. But it must be explained that the fifth passenger was an "extra," and the full complement of weight was upon the car when the speed test was made.

Our place among the starters was third. The 22-h.p. Daimler was second; the first did not appear. The inconvenience

Bush, on his Daimler, lost a place or two, Mr. T. B. Browne coming up strongly on his 18-h.p. James and Browne car, with Mr. Frederic Coleman, of the White Steam Car Syndicate, as Observer. Some discussion arose between Observers as to the accuracy of watches. It grew quite Parliamentary, and the point was nearly decided by chance. However, matters cooled as Tonbridge was invaded, the presence of the Grammar School possibly reminding the argumentative spirits that facts must be recognised—even though watches differed. There was satisfaction among the passengers in the knowledge that time was on their side.

At Tonbridge cars came along in rapid succession, the interest of the townspeople being as languid as elsewhere—this being proof

of the commonplace character which the automobile is assuming in the national means of locomotion.

Leaving Tonbridge, one or two vehicles got ahead soon after leaving control, and maintained their place to the level-crossing beyond Hurst Green, where a coming train delayed the cars awhile. Then before Battle was reached we found our premier place, the James and Browne being urged every now and again to come along. Leaving Battle, with its grey castle frowning in the dull light, we turned sharply to the Lewes road into Ninfield. The whole district recalled Norman days; Battle Abbey is built

The first two cars into Bexhill—the 20 h.p. M.M.C. and the 18 h.p. James & Browne. Photo by [Argent Archer].

on the site occupied by the English army at the Battle of Hastings, and near Ninfield is Standard Hill, where William the Conqueror planted his standard before that epoch-making event. Then on to Bexhill went the procession, our No. 133 still at the head. The last few miles were rendered of interest and almost of excitement by the evident conflict between regulations and preference indulged in by Nos. 133 and 100. The honour of being first into Bexhill was in jeopardy once or twice, but Mr. Iden is a sportsman as well as an engineer, and he knew his car, with the result that we were first upon the parade.

THE SPEED TRIALS.

A fairly-sized crowd of spectators awaited the coming of the cars at Bexhill. That upon which we rode was the first to pass

On the road from Bexhill.

beneath the banner of the *Motor-Car Journal*, which, stretching across the road leading to the shingly beach, was an indication that the outward trip was at an end. Having been stopped a few minutes on the Front the vehicles were piloted to the top of Galley Hill, from whence they sped over a half-mile of the track. No one seemed concerned at the speeds attained. A few months ago, when M. Serpollet did fifty-three miles an hour on the same track, the event was wired throughout the world; now a speed of forty-four miles was attained by a touring vehicle without anyone wondering. Verily times are changing and matters are being

accelerated. The track is 1,350 yards long, but times were only taken over 880 yards, with the following result:—

CLASS A I.		CLASS E.	
	m. p. h.		m. p. h.
1. Century Tandem (No. 1)	.. 31.8	1. 10-h.p. Gardner-Serpollet (No. 105)	.. 42.8

3. 12-h.p. Star (No. 77)	.. 39.2	3. 22-h.p. Daimler (No. 136)	.. 30.8

Mr. G. Iden made the fastest time of the day, and it will be seen that another M.M.C. was also successful in Class B. One striking feature, on glancing at the results, is the uniformly-

At the Uckfield level crossing.

good performance of the cars, particularly in Classes B, C, D, E, and F.

At 1.30 we started back in good spirits for the Palace *via* Purley; but within twenty minutes were standing disconsolately, while others were waving fond adieux. The worst of being No. 1 is that every car up to the end of the line can see you when in distress. No. 100 can linger in silence; but No. 1 is beheld by all. In the two minutes' stop—the first the 20-h.p. M.M.C. had indulged in during the week—a score of vehicles went ahead. Then we got going again, slowing down for five minutes at Gardner Street, Mr. Iden dismounting with as cheerful a countenance as could be expected. Still cars passed on, a seemingly endless procession, while we sat comfortless. Then we got going again, and soon reached the dust clouds made by other cars. A policeman on foot and another in a trap—the word to be taken as signifying a horse-drawn vehicle—sauntered along with an easy nonchalance as though motors were nothing to them. Suddenly ahead was a little confusion, and a Wolseley and a Georges Richard were seen coming into the straight road, having followed about a score of other cars before discovering that the wrong turn had been taken. And thus we came to something nearer our own; when we had to slow down in Uck-

field giving the writer an opportunity of "snapping" one or two rear ends of cars as they took the level crossing in the little town. Ignition troubles were the reason of our undoing, the primary cause being the choking up of everything, due either to deposit from the spirit used or from the excessive dust of the previous runs.

Uckfield has an unenviable reputation, so far as the attitude of its magisterial bench to motorists is concerned, but the people of the town seemed friendly enough, and warned the passing motorists of a trap ahead. So all went slowly through Maresfield and across Horney Common into Nutley, beyond which we saw the waving handkerchiefs indicating danger. We were asked to stop and warn others coming along.

to the dull monotony associated with the daily doings during the Trials.

We then had a gentle spin into East Grinstead, passing the Spyker car, which was leaking lubricating oil, and entered Godstone for tea, the Clayton Arms Hotel being the venue. Beyond there were no incidents worth recalling, save that on the hill nearing the Palace the ignition again went wrong, and prevented that good run at the end of the day which we had anticipated in the morning. There is no advantage for descriptive purposes in starting in the first three cars; but neither is there anything gained in being laggard as we were. The feeling of desolation that comes over one as cars go on while our own engine is unresponsive is not inspiring. We lost note of the cars that

[Argent Archer.

So we waited awhile, and then proceeded cautiously, scanning the green country around for shades of blue. It was rumoured that a man in a blue serge suit by the hedge was on the watch, and the writer—a fifth passenger, whose dismounting did not vitiate the record of the car's performance—got down to reconnoitre. We came across the gentleman, in company with two others. With a suddenness that surprised the party a clicking sound was heard—result to be seen in the centre of the photograph on page 594. The plain clothes policeman did not like the smiles of his companions, and we took the liberty of again snapping his personality—an operation which caused him to turn his back upon us in the way depicted on the left-hand picture. Altogether, the incident was interesting, and formed a little interlude

gained, while we remained. Still, it must be confessed the car ran well to Bexhill, and the incidental trouble that followed us homeward did not detract from the merits of the trusty and speedy M.M.C.

FRIDAY—TO WINCHESTER.

A SLOW DAY IN POLICE TRAPS.

FRIDAY was a merry day, for to all the pleasures of the scenery were added a succession of "war's alarms" that fed the spirit of adventure. To sit quietly on a car for six or seven days in succession is proof that the man who does so is "a patient and long-suffering animal." It is a trial of the

passenger as well as of the cars and becomes a little wearisome after awhile. Consequently the excitement that befel the motor-ing voyagers on Friday came as a relief, although many an old salt would have declared it to be the natural consequence of setting forth on the fifth day of the week.

But we are anticipating somewhat. The scene at the start was much the same as that of the previous day; and that of the previous day resembled that of the day before. Having learned something of the ways of English vehicles, we had arranged to observe the journeying from a Scottish car; hence the fate which landed us on No. 79—a trusty Argyll that made non-stop runs. Four Argylls had journeyed the 410 miles from Glasgow to London to participate in the trials; they had come along in good style, ploughing through floods and surmounting hills as though intending to prove old Dr. Johnson's epigram that the best road for the Scotchman is that that leads to London. But Dr. Johnson was a wee bit prejudiced and would probably have expressed surprise had he seen the Argylls return to their native heath with equal celerity. Three of the vehicles behaved themselves splendidly in the trials, and one—the 10-h.p. car—was of the four to have a daily succession of non-stop runs. The other was the three-cylindered car illustrated in the *Journal* a fortnight ago. This had been fired out after a mischance at Charing, where it was found that the lubricating pipe had become choked, causing the connecting rod to seize. The driver and mechanic got the car to a yard where there was a pit, and were beginning to investigate the matter, when a lighted match was thrown down. Immediately flames shot upward, encircling the two unfortunate men, who were burnt about the faces and hands. Nothing daunted, despite the pain, they decided to try and get along on two cylinders, and would probably have succeeded in thus reaching the Palace before the expiration of the time limit, but, following the guidance of a larger car in the gathering fog, they ran into a bank and the plucky venture had to be abandoned. It is pleasing to know that both men are progressing as favourably as could be expected under the circumstances.

The driver of No. 79, which started fortieth in the procession, was Mr. H. Parker Thomas, a Londoner who has made Wales his home. At Aberdare he inaugurated a motor-car service that is still proving popular, and at Cardiff he now directs the fortunes of the South Wales Motor Co. Mr. C. Andrews was the Observer, Mr. Alec Govan, the managing director of the Hozier Engineering Company, and the writer occupying the tonneau—a position in which the legs were not unduly cramped by the presence of superfluous oil cans, petrol tanks, water bottles, rattlesnakes, and the score and one other things with which some drivers encumbered their cars.

Seventy-six cars started, the Simms-Welbeck being an absentee, having retired the day before owing to the breakage of the wheel on the shaft driving the auxiliary wheels. Most of the cars were dust-stained and begrimed, while the drivers were not rendered cheerful by the weather outlook, which looked tearful. Fortunately, however, good fortune attended the trials, and ere we had had the first stop a radiant sunshine wreathed the landscape with bright shadows that were maintained throughout the day. Miss Levitt was attended, as usual, by her little black spaniel, and Mr. F. Wellington had mounted a white "toy" puppy on the bonnet of his car, which provided the spectators with plenty of fun as he went along. That dog proved the quietest passenger of the trials, never moving a muscle throughout the run of 133 miles, and testifying, as dog never testified before, to the comfort of the car. The run to Leatherhead was over the same route as that taken on the Worthing trip. At Croydon the roads were terribly greasy and skidding proved an easy if hazardous accomplishment. At Carshalton the Rex car was seen with its bonnet off, but the stoppage cost less than five marks, so that its vanity did not seriously detract from its score. There was quite a tinge of excitement among the people of Epsom as the cars passed through, and a little knot of people gathered further along, where a small dog had defied a 20-h.p. Humber and found the way that ledeth to destruction.

Beyond Leatherhead we passed a children's sanatorium and

received the weakling cheers of the sickly occupants of cots placed in the open air. No incidents occurred, for the greatest half of the Trials had been performed, and only the best cars remained. Through East Clandon, with its shabby little church, and Merrow, with its over-restored Norman architecture, we strode along into Guildford, where a halt of fifteen minutes gave an opportunity of replenishment for those who had endured the tantalising prospect of a shortened breakfast. Guildford seemed to have a fascination for many northerners, and, although the spot in North Street where the cars lined up was not the most picturesque, it served its purpose. News of breakdowns was scarce, and evidently it was going to be a day of few mechanical disasters. The Coventry Humberette broke its connecting rod at Guildford and had to retire, but not before it had completed a distance of 898 miles. No. 35, the 9-h.p. Eagle, made a good pace with a wobbly wheel, which must have caused the Observer to reflect on the necessity of modesty in such a position; passengers on other cars laughed and must have seemed of an aggravating disposition. It is bad enough to have to run the gauntlet of the jeers of the unfriendly; but to have to endure the admonitions and sarcasms of brother motorists is woe

Photo by] The Southsea Run.—The Surprise Inspection of the Cars. [Argent Archer

indeed. In that respect the driver of No. 35 must have been satiated.

From Guildford the way was up the Hog's Back and into Hampshire—the county of black pigs, a litter of which was nearly dispersed soon after we got into the region of police traps. All along the fine ridge, that gave us an exalted view of the country around, were private cars, their owners looking with a critical eye upon the performances of the vehicles engaged in the Trials. On either side of the roadway was a grass-grown space of nearly a dozen feet which might easily be converted to the purpose of road traffic, thus facilitating speedy travel over that famous road. Accustomed to the rugged glories of his Scottish landscape, Mr. Govan regards the routes of the Trial as tame, quiet and unexciting—yet pleasant wihal. But he nearly grew enthusiastic over the prospect as seen from the Back of the Hog, which we strode in company with the Star driven by young Mr. Lisle.

A good pace was made to Farnham, where the order for "slow music" was given, the word of caution coming from the first of the caution boards of the A.C.G.B.I. which we had encountered. Many wondered why the board should have been placed in such a position. If the hill warranted any such warning, how many hills have been overlooked? Into Farnham we went cautiously, and could not help remarking upon the fine appear-

ance and position of the garage established in the East Street by Mr. Wiltshire, who evidently intends to make his mark in the motor world of the district. A passing motorist gave us warning of danger ahead.

After leaving Bentley we saw the first policeman, looking a picture of innocent patience. Slowly we passed him, and about a quarter of a mile further along saw P.C. 78 of the Hampshire Constabulary lurking by the hedge. The opportunity was too good to be lost. We asked him the time, but he genially observed that we knew the time of day as well as he, and when he was asked to pose for his portrait with his stop-watch in hand declared his willingness. But there, we won't give him away; he was such a nice man—too nice for the disagreeable duties that now fall to his lot. Fancy a custodian of law and order, a limb of the law, an upholder of the Majesty of the King, lurking by the hedge waiting to harass the loyal subjects of the Crown. While engaged in pleasant converse we noticed a car coming along, and, recognising our duty to ease the labours of the police, we raised our handkerchiefs as flags of truce and retraced our tracks to the first portion of the trap, warning about a score of cars and leaving one to warn the others. Thus the trappers were defeated for awhile. At Chawton another trap was discovered, the guardians of which were greeted with a blowing of horns, a

recovered his surprise and regained his position on the roadway ere he had a similar shock from the Argyll, the apology of Mr. Thomas being as touching as the mishap was accidental. Few incidents occurred on the way to Winchester, where the cars were drawn up in the shadow of the great statue of King Alfred. Ancient Winchester might have provided the tourists with much of academic interest; but hotels gave them more utilitarian fare.

From the Hampshire city we went at 1.30 p.m. A few cars were still going gamely towards their objective, but nothing was seen on the roadside, save a few policemen, to whose presence we were becoming irritatingly familiar. It was a crawl up hill into Alresford, and a slow procession to Alton. About a dozen cars were following the Gladiatorial lead of Mr. E. H. Arnott, who was going very slowly indeed when a policeman pounced upon him and demanded name and address. He waited to confer, while the other cars passed along, Mr. Arnott's face being a picture, looking, for all the world, like the expression in the scene, "I hear they want more." Ours probably was the answer "Alas, my poor brother." The rustics were friendly, warning us of the presence of the police with ready zeal. A leading novelist has drawn a picture of the antipathy of the village folk in Italy to the authorities, and

Photo by]

The run to Brighton. The scene at Crawley during the compulsory stop.

[Argent Archer.

shouting of voices, and such an aggregation of sounds that we were reminded of Milton's lines—

Clashing, bray'd
Horrible discord, and the madd'ing wheels
Of brazen chariots raged; dire was the noise.

At the village of Four Marks a third successive trap was discovered—a very ingenious and not wholly unwarrantable device, had the day been an ordinary one. Carefully hidden behind the hedges at the bend into the village was a constable, and about three hundred yards further on another, behind a bush, had stop-watch in hand. Doubtless the village was a narrow one, where accidents might easily happen, but to allow traps to be laid on a day when speed was regulated to official limits and everyone knew of the coming of the cars was about as absurd as allowing donkeys to stray on the Gordon Bennett course when Jenatzy was hurtling along like a flying fiend. On through Bishops Sutton, red tiled cottages no longer figured in the landscape, the ancient darkened thatch showing up boldly and picturesquely in the sunlight, while the glades and thickets gave variety to the view. Just before Alresford was reached another trap had to be carefully negotiated. A Gardner-Serpollet ahead nearly spoiled the pedal beauty of a policeman, who had no sooner

the way in which they delight at the outwitting of the police. Something of the same kind was apparent on the Hampshire roads, and even the rural postman, who had seen the distance measured early in the morning, was good enough to raise a warning voice. Just beyond Holybourne, the War Office Wolseley, in t khaki coating, was seen with a couple of soldiers significantly signalling a warning as to the danger ahead. At Bentley the police were hiding behind trees while the long procession of cars, their passengers waving handkerchiefs to warn the vehicles behind, passed slowly along. The succession of handkerchiefs made a remarkable sight as we looked back along the sinuous route, the line of cars being easily distinguished as the white flag fluttered in the breeze. Evidently the slow movement was distasteful to the police, and after passing Farnham one whose toes had nearly collided with a car could resist it no longer, and, ignoring the grammatical niceties of the King's English, hurled the remark, "Ye ain't got no pluck." If we had quickened the pace, the wrath of the law would have been incurred; by restraining the drivers, the disgust of the police was secured. Like the fable of the old man and the donkey, it was impossible to please everyone. Such reflections served awhile until strains of martial music were heard, bandmen seated in three horse-drawn brakes attempting to play "See the

Conquering Hero Comes." The sounding of the automobile horns added discordant notes. Thus over the Hog's Back into Guildford, where a scramble for tea resulted mainly in burnt tongues. There we learned that the 10-h.p. Argyll, which had made non-stop runs every day, was maintaining its reputation.

Leaving Guildford, the way home to the Palace was made through pleasant country allowing a strong contrast between the fresh greens of spring that were seen on the Margate run and the brown, yellow, and red autumnal tints that had come upon the face of nature during the week. Passing the 6½-h.p. Clyde and the 14-h.p. Renault—both going gamely—we made the pace into Leatherhead, seeing the 20-h.p. Humber, suffering from tyre troubles, and the 14-h.p. Brush in even more dire distress.

The road home was a familiar one, and the excellent run of the Scotch contingent was maintained to the last. Bad luck occurred to the De Dietrich when only 200 yards from the Palace, it running short of petrol and having to make a momentary stop. And then into the Palace in good style and in good time the Argyll strode—one of the forty-six cars that made a non-stop run, out of the seventy-six starters. Twelve others did as well for all practical purposes; seventeen had delays involving a loss of more than five marks, and only one—No. 12—had to retire. And thus ended a run mainly through police traps.

The Cars Leaving Crawley.

SATURDAY—TO BRIGHTON.

AN EASY DAY.

THE road to Brighton is familiar to most of those who took part in the competition now passed away into history, and the last day's journey of 91½ miles was looked upon more as a jaunt than a serious task. Although somewhat misty at the beginning, the sun gradually sent out its warm rays until quite a hot summer's day resulted. Early rising cannot be kept up for long without its effects showing, and the consequence was that we were almost too late for the start for London-by-the-Sea. As it was, the last car had just been despatched on its way when we arrived on the Parade outside the Crystal Palace. Little groups of motorists were scattered about chattering over the surprises of the Trials, photographs of some of the officials were being taken, the demolition of the Press box was already in hand, and altogether there was a calmness strangely in contrast with the busy scenes we had witnessed on previous mornings. According to arrangements our day should have been spent on the 24-h.p. Wolseley, but this car having started, we found a seat on the 12-h.p. vehicle of the same make, with which Mr. Luff-Smith, of the Wolseley Company, followed the Trials daily. The car in question is one of the 1904 models, and, while out-

wardly closely resembling the 1903 10-h.p. type, comprises many modifications and improvements. As we sped along our driver mentioned a few of these, which may here be briefly alluded to. In the first place, the Wolseley Company have now adopted pressed steel frames, and at the same time increased the wheel base from 6 ft. to 7 ft. The motor is run at a slightly faster rate than the old type, and is equipped with an improved carburettor and a quick-acting accelerator. The change-gear

The Scene outside the Old Ship Hotel, Brighton.

box has been re-designed, a considerable saving in weight being the result, while it is fixed in the frame on the three-point suspension principle. The car we were on was exactly similar to No. 51 in the Trials, except that while we ran entirely on pneumatics, the rear wheels of the Trial vehicle were shod with solid rubber tyres.

To return, however, to the run to Brighton, it was not until 8.15 a.m. that we left the Palace, making for Norwood Junction, in company with Mr. Brodtmann, of the Continental Tyre Company, on his Adler car. Unrestricted by Observers' instruc-

Gossiping Time on Brighton Front.

ons, there were no stages for us, and consequently no "crawls" to fill up time. On the other hand, a steady pace was maintained, notwithstanding the several miles of tram way lines. The narrow, busy High Street of Croydon was safely negotiated, not, however, without its incident, due to one of those dangers of the highway—a hooded van, the driver of which turned sharply round without giving a thought to any other traffic—vehicular or pedestrian. At Purley Corner we got beyond the

ever-increasing tramway system, and felt that at last we were fairly on our journey. Stoats' Nest and Coulsdon were soon left behind and nothing marred our progress until at Merstham we were reminded of the recent military manoeuvres by meeting an Army Service train fully half a mile long. Stopping not to make odious comparisons between the slow, rumbling military wagons and the speedy motor-car, we headed for Redhill. A mile or so on the London side of that town a car was seen to be in difficulties on the roadside, and as we passed by we discerned Mr. F. Wellington busily engaged in studying the internals of his 14-h.p. Brooke car.

Redhill gave us a hearty cheer as we slowly ran through its

The Cars ascending Handcross Hill.

ong chief thoroughfare, and even the policeman on point duty urged us forward. For once in a way, both Surrey and Sussex policemen thought not of traps to catch poor misguided motorists, but actually assisted in making the way clear for them, and in this respect the final run of the Trials stands out boldly from some of the preceding days. The interested crowds of spectators met with as we speeded along over the pleasant switchback road across Earlswood Common indicated that we were rapidly coming up with our quarry, or, to be more exact, the Trial cars, of which one of the White steamers (No. 84) proved to be the rearguard, the driver and mechanic being seen busily grappling with a burst tyre as we passed it near that curiously-named place, Pease Pottage.

A few minutes more and we were in Crawley, where the competitors had had a compulsory stop of fifteen minutes, considerably extended in the case of half of them by reason of the closing of the level crossing gates. The modern rivals to the railway puffed and snorted at this undignified delay, and grunted their disapproval in lusty fashion as the cause of the stoppage—a goods train—passed across the road. The gates opened, however, we journeyed along in merry style, in company with the 10-h.p. Lanchester and Mr. Arnott's 10-h.p. Gladiator, and, arrived at Handcross, we bore to the left down the hill for Cuckfield, the inhabitants of which old-time place were all agog "to see the motor-cars." Cuckfield, if for nothing else, is certainly noted for sharp turnings; but, fortunately, these were safely negotiated. On to Clayton we went, at which place we began to come up with the advance guard of the procession. On the long hill near Patcham we were able to observe the behaviour of many of them. All made the ascent in good style, the performance of the 22-h.p. Daimler wagonette, with its ten passengers, including one solitary lady, being particularly noteworthy. From Patcham to Preston and from Preston to Brighton was only the work of a few minutes, and at 10.35 a.m. we pulled up opposite the Old Ship Hotel, after an uneventful non-stop run. Already a number of cars had arrived, and by 11 a.m. most of the competitors were lined up on the promenade under the upervision of the police, whose task, in view of the heavy traffic, was not of the easiest. The scene was a gay one. In addition to the eighty odd cars—competitive and non-competitive—which had come down from London, the local motorists turned

out in large numbers to welcome the visitors, while the many private horse-drawn open carriages with their fair occupants gave additional brightness to the scene.

The order went forth that the start of the return journey would take place at 12.30, instead of at 1.30, as on previous days, and exactly to time the cars began to slowly move away. Not being in control, our party decided to return *via* Cuckfield, and so make for the top of Handcross to see the cars climb this well-known hill. Leaving at 12.40, a speedy run was made to Cuckfield; but our arrival at Handcross was considerably delayed owing to a couple of farmer's horses refusing either to pass the car or to allow the automobile to get by them. The efforts of the men in charge of the animals proved unavailing, and, breaking loose, they set off at a gallop. Our driver stopped the engine and went in pursuit, we meanwhile enjoying a chat on motors and horses with a local farmer. At last Mr. Luff-Smith, whom we had almost given up as lost, returned with the news that he had got the horses into a field, and we set off once again, duly arriving at Handcross in time to see the tail-end of the procession mount the hill.

THE HANDCROSS HILL CLIMB.

Handcross Hill is a fairly stiff ascent, the worst gradient being 1 in 10.31, and the average 1 in 17.15. The distance over which the cars were timed was half a mile, and, although there was a fair number of spectators present, the bulk of these had left their cars on the side road at the top, so that the climb was made under infinitely better conditions than that at Westerham on the previous Saturday. Most of the cars we saw mounted the hill fairly well, some amusement being caused by the driver of a horse and trap passing one of the motor-vehicles on the steep part. At the time of writing no official results are available, but among the vehicles which took the hill at a good speed may be mentioned the following:—14-h.p. Martini, 18-h.p. James and Browne, 10 h.p. Gardner-Serpollet, 24-h.p. Wolseley, 12-h.p. De Dion, 20-h.p. M.M.C., 16-h.p. Rochet-Schneider, 16-h.p. Fiat, 12-h.p. Peugeot, 14-h.p. Brooke, 22-h.p. Daimler, 6½-h.p. Clyde, 10-h.p. Gladiator, 10-h.p. Horbick, 15-h.p. C.G.V., and 24-h.p. Darracq.

Profile of Handcross Hill.

The hill-climb over, a short stop was made in the village of Handcross, and another passenger, making the sixth, picked up. The homeward run was made without incident, beyond meeting a herd of unattended cows and innumerable motor-cars proceeding in the opposite direction. Indeed, it almost seemed as if there were quite as many private cars travelling towards Brighton as there were making for the Crystal Palace. On Earlswood Common we came across a car which, if it were but endowed with speech, could tell a remarkable story—we refer to the *Passe Partout*, which, built for a trip round the world, was dug out of a ditch in Russia, and now bears the legend "Friswell's Big Baby." Redhill, Merstham, and Coulsdon were left behind, as also the 10-h.p. Hallamshire (No. 43) and the 10-h.p. Thornycroft (No. 70), and soon we were once more travelling along

midst the Croydon trams to Norwood, and thence up the hill to the Palace, which was safely reached at 4.15 p.m., the Wolseley car having taken us through without trouble of any kind.

As a wind up to the Trials, the day's run was most successful, for of the 75 cars which started no less than 54 made non-stop runs, while only one failed to get back. How different this from the anniversary run to Brighton in November, 1899, when out of 104 which started from London in the morning only 50 had arrived at Brighton by half-past four, and 95 before eight o'clock, the return trip having to be left till the following day.

ON A STEAM CAR.

The morning was foggy and damp as we took up our position on car No. 84, one of the White steamers. Setting off at 7.48, we had as near neighbours the 12-h.p. Gladiator with Miss Levitt at the wheel, and the 14-h.p. Brooke car. The roads were in good condition, there being no dust, and the air was decidedly cool. Just beyond Redhill we were making excellent progress, and thoroughly enjoying the absence of noise and vibration associated with the White steam car, when it became apparent that something was wrong. The car was right enough.

engine took place. This over, we resumed once more the even tenour of our way, passing through crowds of people at Purley Corner and Croydon, eventually reaching the Palace at 4.10.

RESULTS OF THE DAILY RUNS.

THE following results are based on the rule, which comprises only a maximum of 3,000 marks out of a total of 10,375 for the whole trials. They are not, therefore, necessarily a criterion of the ultimate positions, as the awards depend on the computations of the Judges Committee under Rule 39. Only the cars with a maximum of five "Non-Stops" (out of eight) are given below.

Eight Non-Stops :

No. 39, 8-h.p. M.M.C.

" 48, 10-h.p. Argyll.

" 51, 12-h.p. Wolseley.

" 137, 22-h.p. Daimler.

Seven Non-Stops, one loss of 5 marks or less :

No. 52, 10-h.p. Wolseley.

" 87, 10-h.p. Lancaester.

" 93, 10-h.p. Renault.

" 105, 10-h.p. Gardner-Serpollet.

" 116, 10-h.p. White.

Motorists awaiting the arrival of the Competing Cars at Horley.

[Argent Archer

but we discovered a deflated tyre. Our driver and his assistant soon had their coats off, the wheel was jacked up, and after examination a change of tubes was effected. The cover being replaced, the pump was soon hard at work, and we were just about to make another start when a loud report told us that the outer cover had burst in a weak spot. Fortunately a spare cover was on the car, and in due course we were ready to start again. In the meantime the rest of the cars had passed us, and we pulled up at Crawley for the compulsory fifteen minutes' stop, unnoticed and alone. The run to Brighton was made without incident, the Old Ship being reached at 11.40. Luncheon over, we moved off in turn at 12.45, and found that after all we were not the last car. The journey to the foot of Handcross was uneventful; arrived there, we had a long stop to take our turn to start the climb. The car went up in fine style, and the way it spurted when near the top was delightful. Arrived at Horley, we had the usual fifteen minutes' compulsory stop, and left at 2.55. Between Merstham and Chipstead our progress, as that of the other competing cars, was very suddenly arrested by an official of the Club for the purpose of testing the brakes. Judging from the shock experienced, we imagine it was quite satisfactory! From there we were directed to enter an adjoining gateway, where an inspection of the

Seven Non-Stops, one loss of more than 5 marks :

No. 62, 7½-h.p. Wolseley.

" 133, 20-h.p. M.M.C.

Six Non-Stops, two losses of 5 marks or less :

No. 42, 12-h.p. Albion.

- " 136, 22-h.p. Daimler.

Five Non-Stops, and three losses of more than 5 marks :
No. 79, 16-h.p. Argyll.

TRIAL NOTES.

ONE of the new cars making their first appearance in the trials was the 16-h.p. Maxim of the London General Automobile Company, Limited. The car is on Panhard lines, having a two-cylinder vertical engine attached to the main frame by brackets. The cylinder dimensions are 110 mm. dia. by 120 mm. stroke. The gear box, which gives three forward speeds and one reverse, is carried in an under frame, independent of the main frame, a flexible joint being introduced between the motor and gear. Two side chains transmit the power from the differential counter-shaft to the road wheels.

One of the Storage Tents at the Crystal Palace. (Mr. C. Friswell)

THE 20-h.p. M.M.C. car (No. 133) in the Trials comprises a number of detailed improvements which Mr. G. Iden was kind enough to explain to us. All the various parts connected with the engine, such as pumps, water-cooling fan, etc., are now gear driven, all belt and friction drives having been discarded. The long row of lubricators on the dash is controlled by a three position lever; in one position all are closed, in another they are all open, and in a third only those conveying oil to the various bearings on the motor are open; thus, when the engine is running and the car is at rest, no oil is required in the gear box and other parts of the transmission mechanism, and therefore the lubricators for these parts can be shut off and a saving in oil effected. Another improvement are the two-stage steps on either side of the car giving easy access to the front seat. These will be found a great convenience by ladies, and in addition are ingeniously made to serve the purpose of tool boxes.

A NOTEWORTHY feature of the 12-h.p. Sunbeam car, No. 65, was that the two side chains are enclosed in gear cases. Many attempts have been made to do this, and Messrs. Marston are to be congratulated in carrying it out, as undoubtedly the life of the chains will be considerably lengthened by being protected from dust and dirt.

THE Eagle Engineering and Motor Company, Limited write: "It will doubtless be within your recollection that one of

our 6-h.p. tandems was entered in the Trials, and that it came out satisfactorily in the Brake, Dust, and Noise trials, and did well in the runs commencing from the 18th to the 23rd inclusive. After this latter date it did not run, and we should like to point out that the reason for this was not any mechanical or other defect in the machine, but simply the fact that the man whom we had engaged to drive it suddenly threw up the job without giving us such sufficient notice as would have enabled us to have got another driver to take his place. As the tandem did not run on Thursday, the 24th ult., it was consequently disqualified."

THE following table gives an analysis of the daily runs:—

Date.	Place.	No. of starts.	No. of cars which made non-stop runs.	No. of cars which lost 5 marks or less.	No. of cars which lost more than 5 marks.	No. of cars which retired from run.
Sept. 18th	Margate	104	37	27	30	10
" 19th	Eastbourne	94	26	23	36	9
" 21st	Worthing	(1) 87	36	24	25	2
" 22nd	Folkestone	85	42	15	26	2
" 23rd	Southsea	83	41	11	27	4
" 24th	Bexhill	(2) 77	47	11	18	1
" 25th	Winchester	76	46	12	17	1
" 26th	Brighton	75	54	10	9	(3) 1

1. Nos. 14 and 19, which are included in the "9 retired" on the 19th re-started.
2. Nos. 2 and 125 did not start.
3. Results not computed for one car.

THE following table shows the speed in miles per hour of the twenty fastest cars in the Handcross Hill Climb on Saturday last. The hill has a rise of 154 feet in the measured 880 yards, the average gradient being 1 in 17.15, and in the worst piece being 1 in 10.31.

105	10-h.p. Gardner-Serpollet	26.70 m.p.h.

CONTOUR OF HINDHEAD.

Profile of Hindhead. Average gradient 1 in 24.

MONDAY of this week was spent in washing the cars and removing the dust and mud of the preceding week. At two o'clock about a dozen set out for Westerham to have an opportunity of once more making the hill climb, this concession having been granted as a result of their having been impeded by the great crush on the 28th ult. The judges have since been busy in examining the cars preparatory to drawing up the complete report, which it is expected will not be ready till at least the end of November.

IMPRESSIONS OF THE RELIABILITY TRIALS.

—X—

THE first problem likely to present itself to the casual observer of this year's Trials (he may be mildly relieved that the pedants did not succeed in christening them "Trustworthiness Trials," saving two syllables at the expense of euphony) regards their growth.

Last year fifty-seven cars faced the starter, of which forty-six practically succeeded in completing the week's course; this year the number had increased to 104, of which it appears that nearly the same percentage have reached their goal, in spite of the increased severity of the conditions, which would make this result a marked and evident indication of progress; and the largely increased proportion of cars which are of unimpeachable home origin cannot but be gratifying to all who have the welfare of the industry at heart. But the question suggests itself as to how much longer it will be possible to conduct such a solid phalanx of cars over our none too commodious high roads; and the success and safety with which it has been done is an eloquent testimony to the capabilities of the modern car and its driver.

With regard to noticeable improvements in design, these are

less operose and more efficient; and on the larger cars have a tendency to depart from that appearance which suggests an American soda fountain to the eyes of the profane.

It is also worthy of remark that the British maker has by no means fallen a blind victim to the charms of the honeycomb radiator, therein possibly showing his wisdom, for it is a vulnerable part at best, while its fan, though a practicable, is certainly a theoretically wrong and wasteful aid to cooling, and a quite needless complication on moderate-powered cars. The desire, however, to obtain an up-to-date appearance without actually adopting the honeycomb has led to the production of several outwardly similar types of a more or less continuously tubular structure, which look very promising from the point of view of efficiency and easy repair. Even the enclosing of the ordinary radiator by a case round the edges, though certainly the outcome of a mere pandering to fashion, has advantages—to the driver's knuckles!

It is probable that the final hill-climbing results, when published, will show a marked advance over last year, though those on Westerham will to some extent be vitiated by the unfortunate error of judgment which—combined with the inconsiderate behaviour of spectators—led to some confusion.

It would be premature to criticise the effects of the marking system as yet, though one is inclined to believe that alterations

Photo by]

The Cars in the Large Storage Tent at the Crystal Palace.

[Mr. C. Friessell.

chiefly in minor, though none the less important, matters. Propeller-shaft transmission has become practically standard for powers under 12-h.p., and sometimes a little over; and it is noticeable that the dimensions of the differential box and bevel gear have mostly increased, a point the necessity for which was bound to be recognised before long; while its advantages on the score of perfect lubrication and cleanliness seem, for low powers, to outweigh the disadvantages of inability to alter gear to suit the country, and expense of renewal when worn out or deranged. The few attempts at a more economical transmission in small cars, if not yet phenomenally successful, need not be discouraged, while we know that it is seldom indeed that 60 per cent. of the engine power reaches the road wheels.

It can hardly be said that tyre troubles have diminished, though perhaps tyres of suitable proportions are more generally adopted. There is no doubt, on the other hand, that the standard of electrical fittings has considerably improved. Better accumulators, better plugs, and, above all, better insulation for the wiring of a car have made an enormous difference in the amount of trouble to be expected from these parts of its anatomy under unfavourable weather conditions. Lubrication arrangements are

giving a little more preponderance to actual running performance will be found desirable next time, while the question of facility of adjustment, though recognised to a slight extent under the present system, seems deserving of more consideration. This point deserves further elaboration, as its importance seems to have been lost sight of to some extent by some of the cleverest designers. The extreme instance, of the motor-bicycle in which it was impossible to change the plug without removing the petrol tank, is only a type of minor cases of a similar kind from which few cars are altogether free. Much has been done lately to bring the ignition system into more accessible localities, but there are other parts in connection with which advance on the same lines is needed. The use of gears in which the individual speeds are not separately replaceable is one; the spoiling of an accessible chassis by coachwork which impedes access to the countershaft brake for re-leathering, the clutch, and even in some cases the gear box, is another. In any case, apart altogether from official results, the experience gained by makers in running their cars under such conditions as those of this year's Trials—conditions severer than in any previous competition of the kind in any country—cannot but be valuable in the highest degree,

THE MILITARY MANŒUVRES.

MR. T. UNDERWOOD has kindly furnished us with the following account of his experiences on his 12-h.p. M.M.C. at the recent manœuvres:

On Tuesday, the 15th ult., we left Aldershot at 8.30 a.m. went to Reading to leave an officer who was going down by rail, and then proceeded from Reading to Basingstoke to inspect the repair depot of the steam lorries. From Basingstoke we afterwards went to within six miles of Winchester, there meeting the whole of the transport of General French's army, which extended for ten miles, the road being entirely blocked. The Basingstoke road was then taken to the turning for Micheldever station, where we came across the head of the transport column. Owing to the very narrow road we had great difficulty in proceeding along with the transport, but came across a bye road, or rather an apology for a road, all grass in the centre with two narrow tracks, which ran parallel with the road to Kingsclere. Emerging on to the main road, we passed the rear of General French's army. After lunch at Kingsclere we proceeded to Newbury, inspection being made of the camp and the traction engines. We then made for Aldershot *via* Reading and Wokingham, making a total run for the day of close upon 120 miles.

The Military Manœuvres. Scene at Westbury.

[To the left are Lieutenants Saunders, Kidner, O'Brien, and Davidson on the former's 10-h.p. M.M.C. To the right is Mr. T. Underwood on his 20-h.p. M.M.C. with Major McNulty as passenger.]

On Wednesday we left Aldershot at 9.30 in the morning and visited the repair yard at Basingstoke, proceeding *via* Andover to the camp at Ludgers Hall, then to Bulford, having to travel 4½ miles over the downs. From Bulford we ran *via* Amesbury, Tilshead, Lavington to Westbury, which was the principal camp of Sir Evelyn Wood's force of the West, and returned *via* Warminster to Salisbury, where a call was made at the headquarters of the Second Army Corps. This done, we ran into Bournemouth for supper, left about midnight for Aldershot, which was reached *via* Southampton, Winchester, Basingstoke and Camberley in the early hours of the morning, after a short stay for two hours at Kingsworthy. The total running for the two days, including various other journeys which were made and not set out above amounted to close on 430 miles.

Troubles were very few indeed—three punctures and dirty petrol delayed us for a few minutes. There was no trouble with the police whatever, for, instead of booking our names for exceeding the legal limit they most respectfully saluted, this happy state of affairs most probably being due to the fact that we had an officer on board. Altogether we had a most enjoyable time, although there was plenty of hard work. There is one improvement that might be suggested, namely, that the awakening gun, which is situated on Gun Hill at Aldershot, should be fitted with a silencer.

CONTINENTAL NOTES.

ON Sunday, September 20th, the hill-climbing trial of Mont Ventoux took place under the organisation of the A.C. of Avignon. It has become one of the annual trials, and one likely to survive on account of the nature of the hill. The road leads only to the top, and is almost devoid of traffic. Last year M. Chauchard won this competition on a 70-h.p. Panhard, climbing the hill in a little over 26 min., which was considered a brilliant performance. This year the winner was Dangeau, who climbed the hill on a 40-h.p. Georges Richard in 25 min. 25 sec. Beconnais and Gros, on Darracq cars, took the second and third places, and Bablot on another Georges Richard was fourth.

THE French garage "Paris Automobile" is offering a prize of 1,000 francs for the best design for a new bonnet for the Hotchkiss motor-car, of which they are the sole concessionnaires. Drawings must be sent in to the office of Paris Automobile, 48, Rue d'Anjou, on or before October 1st. At the front of the bonnet there must be a honeycomb radiator, the shape of which is left optional. The length of the bonnet must be 735 mm., the width 614 mm. The distance from the splashboard to the

front of the radiator is 799 mm., and the width of the radiator is 650 mm. The width of the car at the outside of the side frames is 750 mm. The prize of 1,000 francs will be given to the winner should a bonnet after his design be adopted for the Hotchkiss cars; in case it is not adopted the prize will be 500 francs.

THE applications for space in the Grand Palais on the occasion of the Paris Salon, which opens on December 10th, already exceed the total applications last year, and it will be necessary to limit the space to be allotted to each exhibitor, and also the space required for the passages, to the strict minimum. Last year the stands covered 6,500 square metres, and this year they will cover 10,000. Should the number of visitors increase in the same proportion, it will be impossible to circulate on the days when the masses visit the show, and it will be necessary to establish an organised system of keeping to the right or to the left, as the case may be, to prevent a complete block.

THE Touring Club of France, commonly known as the T.C.F., and which has done such good and useful work in marking the principal routes in France, and also the dangerous hills and turnings, has had its head offices at the Place de la Bourse for many years. Some idea of the extent of its work was given

by its president, M. Ballif, at a meeting held last week. Upwards of 2,000 letters and 1,500 post parcels are sent out per day. The library, said M. Ballif, contained fourteen chairs, and was sometimes visited at one and the same time by 120 members. It was decided by the meeting, and with the help of some 1,800 proxies, to close a purchase with the proprietors of the house in the Avenue de la Grande Armée, where the famous, or rather infamous, Humbert family lived and carried on their operations. The 200,000,000 francs inheritance of the Crawford estate has now passed into the hands of the Touring Club of France.

THE classification and distribution of prizes in the Paris to the Sea motor-boat race has caused a great deal of ink to flow, and there is much dissatisfaction. The fact is that the organisers of the race had a good idea, but they had certainly not the experience necessary to carry it out efficiently. But the notion has taken root, and another great event is being prepared for the early spring, March or April, 1904, at Monaco. There will be 100,000 francs in prizes, and already entries are flowing in, although no programme has been yet published, or even elaborated.

The 60-h.p. Mercedes with which Jenatz won the Gordon Bennett Cup has now been fitted out as a Touring Car. The illustration shows it in its new form, with Werner at the wheel and Mr. Clarence Gray Dinmore, the owner, at his side.
[Allgemeine Automobil Zeitung.]

THE Criterium of $\frac{1}{4}$ -litre cyllindred motor-cycles was such an unqualified success that it has been the beginning of a series of trials limited to motor-cycles. The most important actually on the tapis is being organised by the Moto-Cycle Club de France, under the patronage of the "Auto," and consists in a 1,000 kilometre reliability trial, which will take place from the 26th to 31st inst., over six routes out from Paris and back again, on six days, and totalling up to 1,000 kilometres. The trial will be international, and will be run in three series, namely—first, motor-cycles whose cylinders have a cubical content of not more than $\frac{1}{4}$ of a litre; second, motor-cycles whose cylinders have a cubical content of not more than $\frac{1}{2}$ of a litre; third, motor-cycles for more than one passenger whose cylinders have a cubical content of not more than 2.5 of a litre. One litre contains 0.2200968 gallons, therefore $\frac{1}{4}$ of a litre equals 0.055 gallons, $\frac{1}{2}$ of a litre equals 0.073 gallons, 2.5 of a litre equals 0.88 gallons. All competing motor-cycles must be touring machines, such as are sold to the public in regular series, and not machines specially made for the competition. Two hundred marks maximum will be given, divided up over the different qualities as follows:—Regularity of running, 100; brakes, 15; silence, 15; ease and comfort, 10; condition before and after trial, 10; accessories,

10; speed in hill-climbing, 10; mud guards, 10; facility of carrying luggage, 10; weight of machine without accessories, 5; price without accessories, 5. There will be a speed trial over a kilometre at the Velodrome at the Parc des Princes, on the last day, and the speed attained will be endorsed on the certificate given to the winning cars. There will also be a class for groups of three of the same manufacture, and a cup for the most regular group. The entrance fee is 25 francs (£1), and must be sent to M. Leroy, secretary of the Moto-Cycle Club of France, 74, Avenue de la Grande Armée, Paris.

THE Chateau-Thierry hill-climbing trial takes place to-morrow. There are about 40 entries, including four Darracs, one Renault (the same one on which Marcel Renault met with his death in the Paris-Madrid race, and which is now owned by Lord Carnarvon), one Panhard (driven by Heath), and two Mors.

It is said that there will be six Mercedes cars competing for the Gordon Bennett Cup in 1904. This is how it is to come about, according to the latest rumour. Two Mercedes cars have been chosen by the German Automobile Club, and an eliminating trial will possibly put a third Mercedes in the German team. These cars must be driven by members of the German Club, who will not accept professionals in membership. The Austrian Automobile Club, however, is not so particular, and they have just sent in their challenge for the Gordon Bennett Cup. At Vienna-Neustadt, however, the Mercedes Company have their Austrian works, which will provide, so rumour says, three other Mercedes cars for the Cup. The names of the drivers are even given, as follows:—Braun, Werner, and Max.

"LA FRANCE AUTOMOBILE" is about to open the entry lists and organise a competition for touring cars for a journey from Paris to Rome. It will not be a race in any sense of the word, except as far as concerns some special tests over one and five kilometres on the level and up-hill, and a 500 metre race with a standing start and dead stop over a line. The principal points of the competition will be the weight carried, including body, the price of the chassis, consumption of fuel on 100 kilometres of level and of up and down-hill roads, brakes, capability of turning in the least space, comfort, delays. There will be no "closed controls," and any repairs will be allowed *en route*, the cars being treated just as if they were doing ordinary touring. The speed and consumption trials will be made without any previous warning, so that the cars cannot be specially prepared for them.

"LE MONDE SPORTIF" is organising a trial of electrical motor vehicles to be run off from the 19th to the 24th November. The contest will be divided into two categories—one for cars weighing less than 1,500 kilog. and one for vehicles under 2,200 kilog. The first day's run will be from Paris to Rouen, 133 $\frac{1}{2}$ kilometres; on November 20th, from Rouen to Abbeville, 116 $\frac{1}{2}$ kilometres; on November 21st, Abbeville to Creil, 132 $\frac{1}{2}$ kilometres; and on November 22, Creil to Paris, 90 kilometres.

ACCORDING to the American Consul at Yokohama, the Japanese are beginning to regard the jinriksha as a slow method of conveyance, and now look on the automobile with considerable favour. Recently a motor-car has been purchased by a silk firm for use in delivering goods, and efforts are being made to establish a company for operating a passenger automobile service between Nagoya and Atsuta, a distance of about 10 miles.

MR. GEORGE CARTER, of the True Briton Hotel, Folkestone, lately organised a motor trip to Tunbridge Wells. The cars and forty passengers started from Folkestone, breakfasted at Ashford, and then proceeded to Tenterden, Cranbrook, and Pembury, where a brief stoppage was made. At three o'clock the return journey was made by way of Frant and Ticehurst, a stop being made at Hawkhurst. Home was reached after travelling through New Romney, Dymchurch, and Hythe.

HERE AND THERE.

A MOTOR-CAR is about to ply between Richmond and Reeth, in Swaledale.

THE Southern Motor Club is holding a run to Esher to-day (Saturday).

THE Empress Eugénie, with several of her friends, drove over to Windsor Castle one day last week by motor-car.

TO-DAY (Saturday) the Leicester Automobile Club will hold a run to Dunchurch via Lutterworth.

THE Putney Motor Company are, we hear, about to bring out a new covered car specially designed for the use of travellers.

THE last run of the season of the Lincolnshire Automobile Club will be held to-day (Saturday), the destination being Folkingham.

MOTORING visitors to the Crystal Palace will be glad to learn that the Dulwich toll has been reduced from one shilling to threepence.

THE Motor Makers and Garage, Limited, has been registered with a capital of £2,000. Mr. T. W. Acton is the first managing director and secretary.

MR. E. W. SHATTUCK, the President of the American Automobile Club, has just completed a tour of 3,500 miles through Southern France and Switzerland on a 16-h.p. Panhard.

A NEW motor passenger and goods service has been inaugurated between Saarlouis and Wadgassen, Germany. One omnibus seating twenty-five persons and a motor-truck of 20 tons capacity comprise the service.

MR. F. MORTON WALLIS, president, addressing the Eastern Counties Veterinary Society at Yarmouth, has said that if the motor-car traffic continued to increase the vets would have to become motor engineers.

THE summons against Albert Bronet for driving a motor-car at a greater speed than twelve miles an hour, at Southwick, on September 5th, has been dismissed at Shoreham, the wrong man having, by mistake, been summoned.

AMONG the British firms exhibiting at the forthcoming Paris Salon we notice the names of the Wolseley Tool and Motor-Car Company, the Motor Manufacturing Company, the Electro-mobile Company, and the Collier Tyre Company.

AT a meeting of the Farnham Rural District Council the chairman stated that he witnessed the Automobile Club's reliability run from London to Southsea over Hindhead last week, and by the time sixty of the cars had passed over the road the surface was completely disintegrated.

THE London and Brighton Railway Company are said to be proposing to connect Newhaven with the last-named town by means of a service of motor-cars. The road from Newhaven would be across the sea front of the South Downs, a highly picturesque and breezy drive of nine miles.

STIRLING'S MOTOR CONSTRUCTION COMPANY, LIMITED, has been registered in Edinburgh with a capital of £120,000, in £1 shares, to purchase or otherwise acquire the motor-carriage building and engineering business of Stirling's Motor-Carriages, Limited, and to carry on the business of builders and manufacturers of motor-vehicles in all its departments.

AT a meeting of the Sanitary Committee of Dundee Town Council a report was submitted with reference to the suggested introduction of a motor-wagon to be used for carting refuse. A statement was read from the Chief of the Cleansing Staff, Glasgow, to the effect that a favourable report could not be given of the capabilities of a vehicle of the kind. After discussion, the meeting resolved to take no further steps in the matter.

THE Chairman of the Ripon City Bench (Mr. J. Baynes) states that complaints have been made by magistrates and others of the excessive speed at which motor-cars were driven within

the city boundary, and especially about Borrage Bridge and Westgate, and they wished the police to take most active steps to stop such proceedings. Superintendent Keel assured the Bench that the remarks of the Chairman should have due attention from the police, and instructions would be issued accordingly.

AN "emergency cap," otherwise known as a tyre legging, or gaiter, has been brought out in chrome leather by Messrs. Beckworth's, Limited, of Brandon Street, Bermondsey, S.E. This appears to be an effective cover for any rent in tyres, and has enabled many a motorist to get along home when punctures have threatened failure. The same firm are also bringing out an inlay for tyres in chrome leather; as well as leggings for drivers of motor-cars. Their useful tool hold-all contains ample capacity for more than two dozen tools in a length of 32 inches, the tools being kept firmly in position by a leather strap down the centre, which, while allowing for any tool to be taken out, does not loosen its grip of the others. All these specialities are known by the name of "Bonworth."

MESSRS. GEIPEL AND LANGE, of Parliament Mansions, Westminster, have recently developed an ignition system somewhat similar to that adopted on the Chenard-Walcker cars. The ignition plugs on a two-cylinder engine are connected up in series with one another across the high tension terminals of the induction coil. Curiously enough, the company worked out their system without being aware of its previous use, and they have designed a special apparatus in the way of an induction coil for enabling anyone to adopt the new system without making any structural alteration on their vehicles. The arrangement consists of a single-cylinder coil with the secondary winding

Diagram of Connections.

entirely insulated from earth, and which has two H.T. terminals instead of one, as usual. From these terminals a lead is taken to one plug, and the other lead to the other plug of any pair of cylinders working upon the same crank. The high-tension circuit is then completed through one plug across the gap of the second plug to the secondary again. If now a connection is made, every complete revolution, to the primary, a spark will take place in each cylinder every revolution. The two gaps being in series, one gap acts as intensifier to the other. With this arrangement a single coil is thus used for each pair of cylinders, while the wiring of the low-tension circuit is simplified. Only one contact is necessary, although the cam has to have two projections, or segments. If, however, the car is specially designed for such arrangement, there is no need for a half-time shaft operating the firing device, as, a contact having to be made at every revolution, a simple cam fitted on the end of the crank-shaft working in connection with one trembler or positive make device is all that is necessary. The coil which Messrs. Geipel and Lange are providing is one which has sufficient capacity to provide two sparks in series of sufficient intensity to fire charges over very wide ranges. It is a trembler coil furnished with the well-known Vulcan high-speed trembler, which is provided with no adjustment, as the trembler, having once been set by the makers, does not require any alteration. It vibrates at the high rate of 450 vibrations per second, and a spark is produced under all conditions. We understand that Messrs. Geipel and Lange have two double-cylinder cars running satisfactorily under this new system, and that the actual current consumed is only .15 ampere when running at average speed.

MOTOR-CYCLING NEWS.

PRINCE ALBERT OF BELGIUM is not only an ardent motorist, driving his own 24-h.p. car, but has become a convert motor-cyclist, having used his machine in the recent Belgian military manoeuvres.

A Snapshot from Deauville, France.

THE Secretary of the Auto-Cycle Club will be pleased to hear from any members who will be willing to attend a Sunday run, which it is proposed to hold early this month. Suggestions for a suitable destination are also invited.

THE New York Motor Cycle Club is organising a braking or stopping contest to be held during the present month, and a 100-mile road test for November 3. In the latter event the contestants will not be permitted to pass the pacemaker nor to fall further behind than a given distance, say one mile. All lapses in this regard, and all stoppages, will involve a loss of points. The club has also provided for the winter season by instituting a series of "Saturday night talks," when lectures and addresses on various subjects of motor-cycle interest will be given.

The Motor-Cycle Racer of the Future.
(Das Schnauferl, Munich.)

WHAT should have been the final test for the Edge trophy took place over the usual 200 miles course in the neighbourhood of Hatfield on Saturday, under the auspices of the Motor Cycling Club, but since three of the eight competitors made non-stop runs the tie will have to be re-ridden. There were only ten entrants, of whom the following started at 6 a.m.:—F. Clarke (2½-h.p. Werner), H. E. Cowles (2-h.p. Stockwell), J. Crundall (3-h.p. Humber), W. R. Heighton (2½-h.p. Vinco) Leonard Jones (1½-h.p. De Dion tricycle), Milligan (2½-h.p. Bradbury), A. S. Wilson (2½-h.p. Ormonde), and Holmes. Clarke and Crundall failed early in the trial

owing to ignition troubles in the one case and trouble with the petrol pipe in the other, and at the end of the first hundred miles Heighton, Holmes, and Wilson were disqualified for exceeding the speed limit, thus leaving only Cowles, Jones, and Milligan, who completed the 200 miles without a stop.

AT Hammersmith, on Tuesday, the inquiry was concluded with reference to the death of G. F. Lea, aged 35, electrical engineer, of Parson's-green, who died in the West London Hospital. One night last week deceased was riding along the Lower Richmond Road, Putney, on a motor-cycle, when he dashed into a private omnibus and was seriously injured. The jury returned a verdict of "Accidental death," caused by the excessive speed at which the machine was travelling.

EVERY motor-cyclist of experience knows the advantage of at times injecting a little paraffin into the cylinder head of his motor to unstick the piston rings and melt the congealed oil upon the walls of the cylinder after a period of rest. In a great many cases this task is shirked because of the trouble involved in doing it. Mr. J. Van Hooydonk, of Phoenix Motors, Limited, has devised an appliance to facilitate this operation, consisting of an exaggerated lubricating cup designed to screw into the cylinder head, just large enough to contain sufficient paraffin for the purpose, and furnished with a spring-controlled valve through which the paraffin, after having been injected to the cup, can be ejected

therefrom into the cylinder. This also serves a double purpose, inasmuch as after the operation has once been performed for starting, the cup can be refilled and the charge of paraffin remain in it until next required. It is impossible to inject more paraffin than the proper quantity for the reason that the valve is really a small measure, and when the cup, which extends to half the height of the valve, is filled, it contains only one complete charge. The valve is fitted with a cap which excludes not only all dust or dirt, but which, fitting as it does on to the bevelled edge of the cap, draws the valve up tightly in its seating, so avoiding any possible loss of compression. When the time comes for the reserve charge of paraffin to be injected to the cylinder, the milled cap need only be loosened a few turns, and then, by pushing it down, the valve is opened, allowing the paraffin to descend to the cylinder. We may add that the device is suitable for motor-cars as well as motor-cycles.

THE Dutch automobile reliability trials have been in progress during the week, thirty-nine cars taking part.

REGISTRATION under the new automobile law in Massachusetts began on September 1, and up to the 29th ult. the number of vehicles registered was 2,830.

PRINCE KHILKOFF, the Russian Minister of Roads and Bridges, has just made an automobile tour through the Caucasus, as a result of which a motor-car service for the transport of passengers and goods is shortly to be started between Soukouné and Touapse.

CORRESPONDENCE.

TRAPPING MOTORISTS.

TO THE EDITOR OF THE *Motor-Car Journal*.

SIR,—I appreciate your weekly warning as to "police traps," and can confirm your reference of September 5th to the one between Purley and Horley. On Sunday, August 30th, I was travelling from London to Brighton, and on the road mentioned by you was stopped and informed that the speed I had attained over a measured distance of 176 yards was at the rate of 26 miles per hour. It appears that the police signalled from one point to another and then timed by means of a stop watch, which I think is totally unfair, seeing that the measured distance selected is downhill all the way.

However, I duly appeared before the Reigate Bench of magistrates on the 12th ult., and was mulcted in a fine of £2 and costs. They had a very good "bag" on that day, seeing that there were twenty-eight of us fined in amounts varying from £1 10s. to £10 and costs, but I think that it is totally unfair to time any vehicle downhill, especially on a quiet country road the same as exists between Purley and Horley.—Yours faithfully,

F. G. LUCAS.

A CARBURETTOR QUERY.

TO THE EDITOR OF THE *Motor-Car Journal*.

SIR,—Could any of your readers kindly give me the following information:—1. Is the "Trusty Carburettor" suitable for a 3½-h.p. De Dion? 2. Would the fact that I have to stop and start my engine thirty times a day be an objection to its use? The "Trusty" carburettor burns paraffin oil after the engine has been started with petrol.—Yours truly,

W. PEMBERTON PEAKE.

SIDE SLIP.

TO THE EDITOR OF THE *Motor-Car Journal*.

SIR,—Can any of your readers tell me what is best to do, or the simplest effective appliance to get, to prevent slipping—the roads here in Devon are hilly, and at times very greasy? My car weighs about 10 cwt. and has 26-inch artillery wheels, with pneumatic tyres.—Yours truly,

W. MUDGE.

INSULTS ON MOTORISTS.

TO THE EDITOR OF THE *Motor-Car Journal*.

SIR,—Having read the case of a motorist being hit with a whip by a horse driver, I thought I would let you know that I had a similar experience about six weeks ago. While travelling between Kendal and Cockermouth, on a piece of narrow road, I met a gentleman (?) driving a horse and trap. When he saw me he held up his hand for me to stop, which I did, I also throttled my engine down so that it made hardly any noise. The horse went past without taking any notice at all, but as the driver came abreast of me he slashed me across my face with his whip, leaving a thick blue line on my face. The road was too narrow to turn without some trouble, or I should have followed, him and taken his address. After such unwarrantable acts as these one can hardly wonder if motorists take no notice of signals from horse drivers.—Yours truly,

FRED W. CANNING.

THE TEN-MILE LIMIT.

TO THE EDITOR OF THE *Motor-Car Journal*.

SIR,—I think that many motorists are unaware that county councils are inviting district councils and other local authorities to take action under the new Motor-Car Act, and to suggest roads, for nomination to the Local Government Board, which shall be closed to motor traffic as being less than 16 ft. wide or over which the speed limit shall be only ten miles an hour. Local motor-car owners and motor-cyclists must organise themselves immediately and take prompt action, appealing to their local authorities by deputation or otherwise, suggesting that, as they are strong, they should be merciful, and pointing out the great severity of the Act without the imposition of the above clauses. Unless they organise the whole country will be cut up into ten mile areas where not definitely closed to motor traffic.

It is only local influence that can induce these authorities to postpone action and to give motorists an opportunity of showing that the application of these clauses is unnecessary. What we need is an organisation consisting of local units, strong branches, with a central committee of representatives for general control. The maximum subscription must be a really small one, within the reach of every motor-cyclist, and half of it at the disposal of the local committee. Such an association would reach everywhere and know everything that was being done, and seize an opportunity that would be missed by a central body. We do not need a weekly journal, we are already well supplied, but at the most a monthly report on C.T.C

lines. All these points seem essential to really successful action. Prompt local organisation has had a wonderfully good result in the large town from which I write.—Yours truly,

CARPE DIEM.

AN "ACT" OF DISCOURAGEMENT.

TO THE EDITOR OF THE *Motor-Car Journal*.

SIR,—Mr. Norman D. Macdonald's letters are too long to admit of reply, otherwise you would need another sheet in your *Journal*. It may be not unfair to suggest to him that it is a waste of powder and shot to keep a fire of explosive bullets pouring on adversaries who, in view of himself and his friends, are down already.

I would only say one word as to his accusation that it is "going out of the proper duties of a Club to help the police and the authorities to look after a very commonplace class of offender." It is not a question whether it is a duty, the true question is: Is it an interest? And I for one hold that if we do not do our utmost to put down this "commonplace offender," whether in doing so we help the police or not, we fail to act in the interests of automobilism. For it is eminently in the interest of the Club and all who use motor-cars that a class of people who cause us to stink in the nostrils of the community in an increasing and most injurious degree day by day should be put down, whatever we may be called upon to submit to effect it.

It is all very well to shout "delay, delay, delay," and that we should have sat tight, etc., etc. But your correspondent will never persuade those who know that delay could have been attained, and he will never persuade me that, had delay been obtained, it would not have been infinitely worse for all automobilists in the end. Another year of unrestricted road-hoggism would have been disastrous.—Yours truly,

J. H. A. MACDONALD.

THE EMISSION OF STEAM.

THE Motor Transport Company, London, was summoned at Farnham for being the owners of a locomotive which emitted steam in contravention of the Locomotive Act of 1865. The company was represented by Mr. Douglas Mackenzie, managing partner, who, addressing the Bench, said that the locomotive in question did not come under the Act of 1865; it came under the Act of 1896, and to be in accordance with the provisions of that Act it was so constructed that no smoke or visible vapour was emitted from it except from some accidental or temporary cause. The evidence of the sergeant showed that the cause was temporary. The Act did not say "accidental and temporary cause," but "accidental or temporary cause"; and he submitted that the steam which the sergeant saw was only temporarily emitted. When the cylinders got cold, water collected in them, and it was necessary to force it out by steam to prevent the ends of the cylinders being blown out. John Brone, the driver of the locomotive, said that on the day in question he was driving from Alton to London, having delivered a load of oil at the former place. He stopped to get some food at a place near the post office in West Street, Farnham, and stayed there about a quarter of an hour. During that time some water had collected in the cylinders of the locomotive, and when he started he opened the cylinder drain cocks to let the water run out. He had gone about a hundred yards—from the post office to the town hall—when the sergeant stopped him. It was from a temporary cause that the steam was emitted.

After a short consultation, the Chairman said the Bench considered that the steam had been temporarily emitted, but he thought the company ought to caution their drivers against emitting it in the town. The case would be dismissed. The company would pay the costs. Mr. Mackenzie said it was a point of law that the costs should not be charged in a case which had terminated like that. After consultation with the clerk the Bench remitted the costs.

POLICE TRAPS.

A TRAP in which the telephone is an important factor is in active operation between Sawbridgeworth and Bishops Stortford.

A POLICE trap has been in active operation on the Acle and Blofield road (Norfolk).

FOR a fifth of a mile on the hill going from Camberley to Bagshot is a police trap of which motorists should beware.

MOTOR-CAR ACCIDENT.

AT West London Police-court, William Fraser, a motor-car driver, of Peckham, was charged with wantonly driving his car, and causing bodily harm to John Wright, a watchman, Lower Tooting. The injured man was crossing Upper Tooting Road on the 25th ult., when he was knocked down by the car and dragged along a considerable distance. He was picked up insensible, and removed to the hospital. The magistrate ordered a remand, and allowed bail.

* Indicates Motor-Cycle Cases.

CAPTAIN SIR ROBERT K. ARBUTHNOT, Flag Captain to Admiral Sir John Fisher, Commander-in-Chief at Portsmouth, last week appeared before Admiral Field and other magistrates, at Fareham, to answer a charge of driving a motor-car at an excessive speed on the road between Porchester and Cosham. A constable, named Ballard, said defendant's car covered a measured quarter of a mile in 43 seconds, which was equal to 21½ miles an hour. In cross-examination, he produced a photograph with a view of refuting defendant's suggestion that it was impossible for him, when 440 yards away, to see when a car got on to the mark. The Bench came to the conclusion that defendant was travelling over twelve miles an hour, and therefore fined him 40s., including costs.

CONSIDERABLE interest was taken in a case tried in the Dunfermline Sheriff Court, in which William Stirling, motor-car driver, Blair Castle, Culross, was accused of having, on 17th August, in Kincardine-on-Forth, driven a motor-car in a furious and reckless manner and run over a dog and nearly run over a postman. All the witnesses for the prosecution agreed in saying that the car was being driven at the rate of thirty miles an hour at the time of the two incidents mentioned, while the occupants of the car and the driver estimated the speed at from eight to ten miles an hour. In finding the charge not proven, Sheriff Gillespie said that long before the days of motor-cars it had been found exceedingly difficult to measure the speed of a vehicle, and the difficulties were now increased. Most people would certainly over-estimate the speed of a motor-car, because the noise and the vibration were apt to make them think that the vehicle was going faster than it really was. He did not wish to lay too much stress on the evidence of the occupants of a vehicle, for he had always found during his twenty-three years' experience that every one of the occupants identified themselves with the driver. In this case, however, it had not been proved to his satisfaction that the car was going at a speed that was excessive. At the same time, he hoped that the driver would be very careful in future in Kincardine. In the course of the proceedings the car was brought to the County Buildings, in front of which it was put through a short trial to illustrate a point raised in the case.

AT Steyning Petty Sessions, Samuel Batson, of Beckenham, was summoned for furiously driving a motor-car at Washington. P.C.

Turner said defendant was travelling at the rate of twenty-three miles an hour. Witness stopped him but he refused to give his name and address. He re-started his car, and nearly knocked witness down. Afterwards, however, defendant got out of his car and gave his name and address. Defendant was fined the full penalty of £10 and 7s. costs.

GEORGE ALBERT WALLACE, of Willesden Green, was summoned for a similar offence. P.C. Turner said defendant was driving at a rate of twenty-five miles an hour, and the magistrates imposed a fine of £5 and 7s. costs.

HARRY PHILPOT, of London, was charged with a similar offence. The speed in this case was said to be 19½ miles an hour, and defendant was fined £3 and 7s. costs.

THOMAS WEATHERHEAD was summoned for a similar offence at Henfield. P.C. Thompson said defendant was driving at the rate of 18½ miles an hour. Fined £2 and 7s. costs.

CONSTABLE HUGHES, who proved the two cases at Garstang, said no inconvenience was caused to vehicles or foot passengers.

It is rumoured that the Dublin, Wicklow, and Wexford Railway Company contemplate running a service of motors between Shillelagh and Newtownbarry.

AN Australian correspondent informs us that a proposal is under consideration to organise a motor-car and cycle reliability run from Sydney to Melbourne next January or February.

FROM a postcard dated the 25th ult., we learn that Madame Lockert, who is making a journey from Paris to St. Petersburg on a 14-h.p. Tony Huber car, had safely reached Berlin, where she met with a great reception.

MORE than £25,000 worth of automobiles are said to be in the Appraisers' Warehouse in New York awaiting valuation. Many of them cannot be handed over to their owners until disputed questions of value have been settled.

THE Office of Public Road Inquiries of the United States Department of Agriculture, Washington, has issued a reprint from its year book containing an article on the "Use of Mineral Oil in Road Improvement," by Mr. James W. Abbott.

WE briefly mentioned in our last issue that the Speedwell Motor and Engineering Company, Limited, had secured the sole agency for the new Leon Bollée cars, a feature of which is said to be the extraordinary quietness in running, and the great elasticity of the engines. The general lines of the car are similar to those of the Mercedes, and it is fitted with a honeycomb radiator of an improved design. There will be two models, 24-28-h.p. and 40-45-h.p., both with four cylinders.

FROM Messrs. Merritt and Hatcher, Limited, we have received a copy of a little book on "Gas Engines: Their Advantages, Action, and Application," written by Mr. W. A. Tookey. As the title implies, the work deals with gas engines, but as the cycle of operations in these is the same as in petrol motors, users of the latter will find much useful information in Mr. Tookey's book, which deals with the care and management of gas engines in a thorough manner.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

VOL. V.]

LONDON, SATURDAY, OCTOBER 10, 1903.

[No. 240.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

Road Improvement.

THE report of the Departmental Committee on Highways is, on the whole, a very satisfactory one. If the recommendations of the Committee are carried out, they will go a long way to solve many of the difficulties of the "motor problem." As we intimated last week, the Committee recommend that certain selected roads should be known as "national roads," be subsidized by the State, and their maintenance supervised by a Central Department. The proposal also that bye-pass roads should be built for fast traffic round towns whose streets are already crowded by local traffic, is a very important one, while the suggestion for giving the authorities additional powers to widen roads is, in view of the Motor-Car Act, another matter of supreme interest to automobilists.

Roadside Wastes.

THE question of roadside wastes, to which we referred in our report of the run to Winchester last week, is, we are glad to see, recognised as one of great importance—a fact which the Committee attribute to the great and growing increase of automobile and other fast traffic. For the purpose of protecting these wastes, with the view, we would suggest, of ultimate incorporation into the roadway, the Committee have adopted the suggestion of the Commons and Footpaths Preservation Society. This was to the effect that the county courts should be empowered to settle the question of what land forms part of a highway or the waste of such highway on the application of the highway authority—or of a specified number of rate-payers.

A Subject for Discussion.

WE trust these ideas will be incorporated in a Bill, and that the measure will be passed through the Houses of Parliament with all the celerity of a Motor Car Act. The Roads Improvement Association is to be congratulated on the finding of the Committee, which should give road reformers the basis of legislation in the near future. The matter is so important that it should be discussed by every provincial automobile club during the coming winter. We shall be glad to hear of the matter being introduced into programmes, and also of the result of discussions of the points raised.

An Essex View of the Bill.

AT Tuesday's meeting of the Essex County Council a resolution was unanimously passed in favour of giving magistrates power to send a motorist to prison for a first offence under Section 6 of the Motor Car Act, 1903. The section in question, which deals with accidents caused through motor-cars, only enacts a fine not exceeding £10 for a first and second offence, imprisonment being an alternative punishment to a fine for a third or subsequent offence only. Capt. Kemble, R.N., who proposed the resolution, said he thought a motorist who

caused loss of human life or damage to any person should be placed on the same footing as the driver of a horsed vehicle. He referred to the fact that the perpetrators of injury seldom waited to see what damage they had done, but went off full speed on their motor-cars. Under the Act, if a motor scorchers accidentally killed or maimed a pedestrian, all that the Court could do would be to fine him £10 for a first or second offence. Major Sir F. C. Rasch, M.P., in seconding the motion, said they did not want to obstruct the motor-car trade, but they desired to check the "road hog"—the motorist who ruthlessly ran down people, and cared nothing for horses, dogs, poultry, or anything else on the highway. The resolution was carried without a single dissident, and a copy of it was ordered to be sent to the President of the Local Government Board.

A Bill at Bombay.

THE Bombay Government has issued the text of a Bill to regulate the use of motor-cars in the Presidency. The statement of objects and reasons of the measure, which is signed by the Hon. Mr. Fulton, is as follows:—"The growing popularity of motor-cars and the dangers attendant upon their use by reckless or unskilled persons render legislation for their control necessary in this Presidency as they have already in Bengal. The circumstances of different localities are so widely different that a specific enactment of universal application is considered impossible. In the absence, moreover, of experience in the legislative regulation of motor-cars, it is probable that frequent changes will be found necessary. For these reasons it is thought that the enactment should confer the power to make statutory rules. The Bill in its main outline follows the Bengal Motor Car and Cycle Act, 1903 (Ben. III. of 1903). Certain additional clauses are, however, considered necessary. Power is taken, clause 2, sub-clause (2), paragraph (k), to prohibit altogether or to regulate the use of motor-cars on ghats and hill stations, to limit their use to certain hours in certain places and to prohibit other traffic in certain hours. Power is also taken, clause 4, sub-clause (1), to prohibit plying for hire except under license. One reason for this provision is to bring motor-cars within the ordinary obligation of public conveyances to have licenses (cf. Bom. VI. of 1863, which would not apply to the present case). A second reason is that in country districts it is thought desirable, in order to encourage a new application of capital, to retain power to give exclusive rights for a time, not as against the competition of ordinary traffic, but as against rival motor-car companies. In the larger towns free competition would not be interfered with.

Encouraging Experiments.

THIS suggestion as to giving exclusive rights for a time to firms establishing motor-car services in country districts appears to us somewhat novel, but in the circumstances of India should be useful in attracting capital. Otherwise private enterprise can hardly be expected to run the risks incident to such new ventures. For, success once attained, rival concerns would doubtless spring up to rob them of the profits earned after long and patient endeavour. Hence the advisability of encouraging experiments by such means.

For Municipal Work.

THE Cardiff Health Committee has discussed a report of the sub-committee appointed to consider the question of providing automobile refuse wagons and water carts. It was reported that a motor wagon costing £500 would do the work of six horses costing £420, and the maintenance charges for the motor would be £10 per week less than for the horses. The department is at present twelve horses short of its full complement, and it was decided to purchase two motors at £500 each, less 2½ per cent., as an experiment, the purchase money being already provided for in the current estimates. The West Ham Town Council has also decided to purchase an automobile for the use of officers engaged in connection with its new Tramways Department.

Helping the Police.

IN our correspondence columns Messrs. Tetley, Tree, and Tetley give their views as to the question recently raised in these columns with regard to motorists warning others as to police traps being mulcted in heavy fines in consequence. Probably this legal opinion will reassure those who have hitherto refrained from assisting fellow motorists to escape the dangers that lurk in hedgerows and behind bushes. There is apparently no reason why such help should not be rendered, seeing that the object of the Legislature in making laws is not merely to punish evil-doers, but to warn them against committing offences. The motorist who tells others of the presence of the police trap and advises them to go slowly is therefore acting in consonance with the spirit of the law.

Mr. A. Beatson on his Locomobile at the Cat and Fiddle, near Buxton, reputed to be the highest licensed house in England.

The Speed of Tramcars.

THE speed of tramway-cars on the London County Council's electric system was discussed during a case the other day at the Lambeth County Court. On July 12th a car ran into a wagonette in Camberwell New Road, London, S.E., causing several

of the occupants to be thrown out. As a result they sued the County Council, and Judge Emden awarded five plaintiffs damages ranging from £7 10s. to £21. He found that the car was travelling at a speed of over ten miles an hour. As it was proved in evidence that drivers could attain a speed of eighteen to twenty miles an hour on the cars, the Judge said that he hoped the London County Council would devise some check on the men.

The Reliability Trials. The 9-h.p. Beaufort (No. 28) on the Speed Track at Bexhill. Photo by [Argent Archer].

"Justice" to Motorists.

WERE the instance cited by Mr. Dunhill in his letter on another page a solitary case we would have published it without comment; but it is but typical of the state of affairs found on many a county bench and of the animus which actuates the police in several districts. When such is the normal condition of things so far as the attitude towards motorists is concerned, there can be no wonder that owners of cars have little faith in the so-called justice to which they have sometimes to fall unwilling victims. The difficulty of obtaining evidence in favour of motorists is frequently experienced by strangers to rural districts, where the local policeman is often a *persona grata* and his neighbours are not likely to contradict his word.

Motor Transport for Goods.

AT a meeting of the Society of Engineers, held at the Royal United Service Institution, Whitehall, on Monday, Mr. J. Patten Barber, President, in the chair, a paper was read on "Motor Transport for Goods," by Mr. Douglas Mackenzie. To arrive at the actual working costs of motor vehicles, he went at length into the question of repairs and renewals, and emphasized the necessity for laying off the motor one day per week, to ensure proper attention to the boiler and engine. He also pointed out the need for proper supervision, and showed that such must be reckoned in the working costs. He discussed the proper allowance for depreciation, and gave his reasons for fixing this at 25 per cent. per annum. He also pointed out the risks that must either be insured against, or allowed for in averaging expenses. After remarking that every case differed in many of its component factors, and that therefore the costs of motor transport, as compared with horse transport, or railway charges, could not be stated with mathematical accuracy, the author gave a table of costs, the figures given being the mean of those obtained in actual practice, the cases having either come under his own experience, or the results having been afforded by the users themselves. These figures showed that if the loads were less than five and a-half

tons the horse was the cheaper, but that above that the advantage lay with the motor. The author then urged the necessity for a better and stronger form of road wheel, to stand the strain of motor work, and also impressed on inventors the great future that lay before the internal combustion engine when it could be made to work with crude petroleum or residue. The wear and tear produced on the roads was treated at some length, the conclusion being that if the roads were of a proper standard, there was less wear and tear from the use of motor vehicles than from any other form of transport. In conclusion, Mr. Mackenzie pointed out that motor transport was essentially an expert engineer's business, and that the user of one or two vehicles would do better to put his work out to contract than to employ his own motors.

see the car, but the driver could not see him. It rested on his judgment as to when the car passed the first mark and Carr started his stop watch.

The Motor-Car Act and Scotland.

THE following circular has been issued from the Scotch Office to county clerks north of the Tweed:—"I am desired by the Secretary for Scotland to request that you will direct the attention of your County Council, at their forthcoming meeting in the month of October, to the important duties imposed upon County Councils under the Licensing (Scotland) Act and Motor Car Act of last session, which takes effect on the 1st January, 1904. It is proposed at a later date

The Wolseley Petrol 24-h.p. Tractor built for the London Fire Brigade.

A Typical Police Trap.

THOSE who participated in the Reliability Trials had some experiences of police traps. In a case against Mr. T. S. Foster, at the Havant Petty Sessions, the police have explained their method of work. P.C. Green, stationed at Emsworth, said he was on duty in the Havant road, about 10.55 a.m., with P.C. Carr. Witness was one side of the road and the other officer on the other. They saw a car approaching from the direction of Emsworth. As they saw it reach a mark at a measured distance of 220 yards witness said to P.C. Carr, "Now!" When the car had covered the measured distance witness again said "Now." The other policeman then said, "Eighteen seconds. Stop him." The time was registered by a stop watch. The car was stopped and the driver asked him if he was aware he was exceeding the limit. He replied, "Impossible. I might have been going 16 miles an hour, but it was impossible for you to have seen me when we passed your mark." Witness told the defendant he would be reported for driving at 25 miles per hour. In cross-examination, he added that both officers were in plain clothes. Witness stood on the footpath on one side, and Carr stood immediately opposite, hidden in a recess. It was Carr's duty to take note of the time on his stop watch and also to see the car pass the first mark. He stood near the recess, about a yard from the railing, and by looking between two telegraph posts he could

to make a more detailed communication to you on the subject of those duties, but in the meantime, as preliminary action is required, *inter alia*, in the case of the Licensing Act with a view to the possible division of the county into licensing districts, and in the case of the Motor Car Act with a view to the establishment (in accordance with regulations to be issued by the Secretary for Scotland) of a system of registration of cars and licensing of drivers, the Secretary for Scotland desires to suggest that the Council may find it advantageous to appoint a committee or committees at the October meeting with power to take the necessary steps for bringing the Acts into operation in your county."

Captain Deasy.

CAPTAIN DEASY, who has just driven his 14-h.p. Martini car up the cog-wheel mountain railway from Caux to Rochers de Naye, above Teribet, on the Lake of Geneva, is a well-known explorer. Gazetted to the 16th Lancers in 1888, Captain Deasy resigned his commission in 1897 in order to interest himself in exploring. His survey work in Central Asia has been of great importance. Two expeditions covered a period of three years, and during this time more than forty thousand square miles of territory were explored and surveyed, and the heights of three hundred mountains determined. His

experiences with the Tibetans Captain Deasy has described in his book. He found the source of a river which had hitherto been unknown, and he was rewarded when he came home by the highest recognition an explorer can hope for in England. The Royal Geographical Society gave him its medal. Since then Captain Deasy has become as enthusiastic over motoring as he was formerly over mountains.

Motorists' Rights.

IN the case at the Bristol Court, reported on another page, the judge held that motor-cars were entitled to the same rights on public roads as other vehicles. This dictum will probably surprise some of the drivers of horses, who seem to think that their use of the road for so many generations has given them an entire monopoly. The prejudice on the part of many of the drivers of horses against motorists is one of the things which time and experience will wear away, but, meanwhile, it is a real danger to the enjoyment of the pastime. Hence the frequent reiteration of the advice so frequently given in these columns, that drivers of motor-cars should exercise every care, particularly when passing through populous places, or in narrow lanes, where turnings are frequent and hedgerows are high.

In the Straits Settlements.

THE question of a motor-car service on the Pahang Trunk road was first mooted in 1896, long before the removal of head-quarters, when Mr. Yip Yik Chew, the general manager of the farms in this State, offered to provide such a service directly the new road was open to traffic. The negotiations failed, and nothing further was heard on the subject until about 1901, when the Malayan Transport Company brought the matter into prominence. Unfortunately, however, the service which this company was to have maintained broke down at its very inception in March of 1902. Later on, the company went into liquidation; and almost immediately afterwards Messrs. Kester and Loke Yew took the matter up and formed the Federal Automobile Service Company. A contract has been signed with the Government and the company is placing upon the road at least six cars for the mails, and a vehicle with accommodation for twenty passengers and goods.

A Motor-Car Wedding.

ON Tuesday evening of last week about a score of members of the Wolverhampton and District Automobile Club met at their head-quarters, Victoria Hotel, Wolverhampton, for the purpose of presenting Mr. Joe Lisle with a silver tea service, suitably engraved, and bearing the club badge, upon the occasion of his marriage. The Hon. Secretary, Mr. S. R. Rhodes, on behalf of the contributors, expressed pleasure at the opportunity given them of showing in a practical manner their appreciation of Mr. Lisle's efforts to further the interests of automobilism, and his sportsmanlike conduct as a driver. They one and all wished him and his bride long life, prosperity, and increasing happiness. Mr. Owen, chairman, in making the presentation, requested Mr. Lisle to accept the articles not so much on account of their intrinsic value, but more especially because of the kindly feeling which had prompted the gift. The Club were proud of him as a member, and on behalf of its members he wished Mr. Lisle and his bride every possible happiness. Two days later Mr. Lisle was united in wedlock to Miss Bessie Babbage at St. Luke's Church, Blakenhall. The bride was driven to church in a 20-h.p. M.M.C. car by Mr. George Evans, who after the ceremony drove the bride and bridegroom to Dr. Scott's, the bride's brother-in-law's residence, where a reception was held. The Hon. Secretary of the Club drove to the church on a 16-h.p. Ariel, Mr. W. Owen on a 10-h.p. Wolseley, Mr. A. E. Jenks on 8-h.p. De Dion, Mr. Ted Lisle, 10-h.p. Star, and Mr. R. Cobb, 10-h.p. Star. After the

reception the bride and bridegroom left for Southport, the latter to take part in the automobile trials, journeying after the conclusion of the same to Brighton.

A New Use for Old Tyre Covers.

M. PAUL MEYAN, of our French contemporary "La France Automobile," has unearthed—we cannot say invented—a new method of preserving pneumatic tyres from rapid wear. He lately returned from a long automobile tour in Italy, where the roads with their sharp flints very soon cut to pieces five outer covers and eleven inner tubes. Thinking that the expense of fitting new tyres every day or so was likely to make his tour somewhat costly, the idea struck him of using an old outer cover to protect the tyre. The cover, naturally of larger dimensions than the one it protected, was pierced with holes along one edge corresponding with the spokes of the wheel. The tyre was deflated, and one edge of the old cover was forced underneath, while the other edge was fastened to the spokes by wire. The arrangement was so effective that M. Meyan states that he completed his tour without another puncture, and he is convinced that, protected in this way, a tyre will last almost indefinitely. It is true that the double cover rather slows the car, but this is a small price to pay for the added security and the economy effected. The additional outer cover should be somewhat larger in diameter, although of a smaller size; thus, for a 920 by 120 mm. tyre M. Meyan recommends the use of an old 960 by 90 mm. cover and for a 910 by 90 mm., one of 950 by 65 mm.

Eastbourne's Municipal Public Service.

REFERENCE has already been made in these columns to the municipal public motor bus service which has lately been inaugurated at Eastbourne. Four Milnes-Daimler cars form the present fleet, three of these being kept busily in use on distinct routes, one vehicle being kept in reserve. A fifth bus, a Chelmsford steam car, is also on order, to have the same seating capacity as the petrol vehicles. Some little difficulty has, we understand, been experienced as regards tyres, but otherwise the cars are doing well and are much appreciated by visitors and residents.

THE Lincolnshire Automobile Club held its last official meet of the season at Folkingham on Saturday, the 3rd inst.

THE new Wolseley 36-h.p. car failed to do itself justice at the Southport trials owing to a new clutch which the makers found had not sufficient movement to enable it to be properly released, thus making it very difficult to change the gears. In the first, second, fourth and fifth races the driver was unable to get higher than the second speed. The car was quite new, and finished only just in time to be despatched to Southport for the Speed Trials, and the Wolseley Co. had not an opportunity of sufficiently trying it at the works to find out this difficulty.

ALTHOUGH very little has been heard lately of the Hall hydraulic transmission gear, the syndicate which have had the matter in hand have been quietly at work, and are about to put on the market a number of 2½-ton motor lorries fitted with the arrangement. A 3-ton lorry provided with the Hall gear has been in use since February, 1900, and has been driven over every kind of road many thousands of miles. For the purpose of showing the result of such an amount of work the gear was opened a few days ago for inspection, for the first time since it was made. On examination it was found that the gear was still in working order, that the main parts, including the pump and power pistons, plungers and cylinders and main bearings, showed no wear at all. In fact, the only parts which have worn are the bearings of the small ends of the connecting rods, but these are still in working condition and can be bushed at the cost of a few shillings each when it becomes necessary.

THE SOUTHPORT TRIALS.

THE Southport meet of the Liverpool Self-Propelled Traffic Association and the A.C.G.B.I. has come and gone, leaving impressions of bad weather, fair speed, and heavy hotel charges. Over a straight kilometre course the cars and cycles were timed, and although no speeds such as made the Phoenix Park meeting memorable were attained the racing was of an attractive character, some of the endings being particularly close.

The events were run off on Friday and Saturday last, the weather on the latter day being against records, a strong wind

they might congratulate themselves on the visit of the Automobile Club. He was very fond of motoring, but he realised perfectly well that a great many prejudices would have to be removed before the pastime was as popular in this country as in France. He could not say that he was in favour of the Motor Car Act altogether. He thought it was perfectly safe to drive at the rate of from thirty to forty miles an hour on many country roads, while in other places it would be unsafe to travel at the rate of twenty. The speed should be left to the discretion of the drivers, though he was of opinion they ought to pass an examination to secure certificates of efficiency. He trusted that next year's trials would be held in Southport.

[Argent Archer.

blowing in the faces of the competitors. In the early part of the day rain fell, but later the weather settled to fine although somewhat chilly. The final results are given on the following page.

THE PRIZE DISTRIBUTION.

In the evening the prizes were distributed in the Cambridge Hall by the Mayoress, this ceremony being witnessed by a large audience. The Mayor, Mr. T. T. L. Scarisbrick, presided, being supported by officials of the two organising associations, members of the local committee, and a number of others. The Mayor, who, as is well known, is an enthusiastic motorist, said he thought

The Mayoress then presented the cups and bowls, the winners of medals being promised their prizes as soon as they could be prepared. The donors of cups included Miss Daisy Hampson; Mr. Ernest Owers, London; Mrs. Charles Cordingley; Mr. Lionel de Rothschild, London; Mr. C. Higginbotham, Macclesfield; the Liverpool Self-Propelled Traffic Association; Captain Thornycroft Veinon, Southport; Mr. L. Williamson, Southport; Mr. Charles Scarisbrick, Southport; the Mayor of Southport, Mr. T. T. L. Scarisbrick; Mr. J. Preston, Southport; and the directors of the Liverpool Cycle and Motor Show, Limited.

Thanks were tendered to the Mayoress, on the motion of Mr. Williamson, seconded by Captain Vernon, and the Mayor suitably responded.

On Saturday evening a conference was held between a number of motorists and representatives of the Southport Corporation, Mr. Roger Wallace, K.C., presiding. It was decided that, provided the Corporation of Southport forwarded an invitation to hold the motor trials in Southport, a meeting be held there, probably in May or June next year, the date to be regulated according to that of the Gordon Bennett race, which takes place in Germany. The Southport meeting will be held first, and thus the machines competing in the Gordon Bennett race will have an opportunity of competing first in Southport. It was suggested by Professor Hele-Shaw, Liverpool, that the meeting be a three days' one.

Appended are the results:—

CLASS A.—Handicap for machines up to 114 lb. in weight, and cylinder capacity up to 70 by 70: 1, J. Spencer, Ariel (2 min.); 2, C. H. Richards, Minerva (2 min. 9 2-5 sec.); 3, J. F. Crundall, Humber.

CLASS B.—Handicap for machines up to 170 lb. in weight, and cylinder capacity up to 84 by 84: 1, S. Wright, Excelsior (1 min. 27 3-5 sec.); 2, H. Rignold, Riley; 3, B. Yates, Humber.

CLASS C.—Handicap for motors up to 170 lb. in weight, owned by residents in Lancashire.—Heat winners: C. H. Threlfall, Excelsior, 8 sec. start, 1 min. 31 4-5 sec.; H. Rignold, Riley, scratch, 1 min. 32 4-5 sec.; R. Crossley, Riley, 5 sec., 1 min. 45 2-5 sec.; and fastest loser, J. Edge, Bat. Final: 1, C. H. Threlfall; 2, H. Rignold; 3, J. Edge.

The Start of one of the Motor-Cycle Heats.

[Argent Archer.

CLASS D.—Machines of any cylinder capacity, but not exceeding 170 lb. in weight: 1, S. Wright, Excelsior (1 min. 14 sec.); 2, J. F. Crundall, Humber; 3, H. Rignold, Riley.

CLASS E (two-seated cars costing up to £200).—Semi-finals: 1, J. W. Stocks, on 6-h.p. De Dion, 1 min. 40 2-5 sec.; 2, W. M. Letts, 6-h.p. Oldsmobile, 1 min. 54 3-5 sec. 1, J. A. Bennett, 6-h.p. Baby Peugeot, 1 min. 46 sec.; 2, J. S. Newton, 6½-h.p. Vulcan, 2 min. 12 1-5 sec. Final.—1, J. W. Stocks, 1 min. 34 3-5; 2, J. A. Bennett, 1 min. 55 sec.; 3, H. C. Tryon (Pick) (1 min. 58 4-5 sec.)

CLASS F (four-seated cars costing up to £400).—1, G. F. Baker, 10-h.p. Duryea (1 min. 71 5 sec., a speed of 33 miles an hour); 2, A. H. Walker, 12-h.p. Darracq (1 min. 22 1-5 sec.).

CLASS G (£400 to £550).—1, Miss Dorothy Levitt, 12-h.p. Gladiator (1 min. 4 4-5 sec.), the speed being equal to 34½ miles an hour; 2, A. Govan, 16-h.p. Argyll (1 min. 31 3-5 sec.).

CLASS H (£550 to £750).—1, L. Williamson, 16 h.p. Lanchester (59 1-5 sec.), 39 miles an hour; 2, J. T. Overton, 24-h.p. Georges Richard (1 min. 8 sec.).

CLASS J (£750 to £1,000).—1, Victor Miller, 24-h.p. Fiat, (51 4-5 sec.), speed 43 miles per hour; 2, Charles Jarrott, 24-h.p. De Dietrich (58 3-5 sec.).

CLASS K (over £1,000).—1, A. E. Macdonald, 20-h.p. Napier, (53 3-5 sec.), 41 miles per hour; 2, T. Thornycroft Vernon, 18-h.p. Mercedes (60 2-5 sec.).

CLASS M. (Lancashire Inter-Club Handicap for Cup presented by Liverpool Self-propelled Traffic Association).—1, L. Williamson, 16-h.p. Lanchester (57 3-5 sec.), 38½ miles an hour; 2, J. Whittaker, 15-h.p. C. G. V. (1 min. 5 3-5 sec.); 3, J. Bibby, junr., 24-h.p. Wolseley (1 min. 6 sec.).

CLASS N (cars under 650 kilos, 12 cwt. 3 qr. 5 lb.).—1, A. Rawlinson light Darracq (37 4-5 sec.), 59 miles an hour.

CLASS O (cars under 1,000 kilos, 19 cwt. 3 qr. 20 lbs.).—1, S. F. Edge, 45-h.p. Napier (33 1-5 sec.), 67½ miles an hour; 2, J. E. Hutton, 70-h.p. Panhard (35 sec.), 65 miles an hour.

CLASS P (for the fastest car of any type or power under 1,000 kilos. —1, J. E. Hutton, 70-h.p. Panhard (37 sec.), 60·43 miles an hour; 2, S. F. Edge, 45-h.p. Napier (38 2-5 sec.), 59 miles an hour.

CLASS Q (for the Mayor's Cup, open to cars without limit of power, weight, or type).—1, A. Fletcher, 60-h.p. Mercedes (42 1-5 sec.), 53 miles an hour; 2, J. E. Hutton, 70-h.p. Panhard (45 3-5 sec.), 48½ miles an hour.

With the conclusion of this, the official part of the programme, the course was reversed, and some matches and speed tests were run with the wind. A group of motor-cyclists made the first attempt with the following results:—

Humber Cycle	...	J. F. Crundall	...	39 3-5 sec.	...	56·43m.p.h.
Bat	...	T. Tessier	...	35 3-5 sec.	...	62·79 "
Excelsior	...	S. Wright	...	36 4-5 sec.	...	60·74 "
Humber	...	B. Yates	...	41 sec.	...	54·52 "

The matches between the cars showed some curious running, the results being as follows:—

S. F. Edge, 45-h.p. Napier, v. A. Fletcher, 60-h.p. Mercedes: Fletcher, 32 1-5 sec, 69·43 miles per hour; Edge, 34 2-5 sec., 64·98 miles per hour.

G. Higginbotham, 60-h.p. Mercedes, v. H. Austin, 36-h.p. Wolseley; Higginbotham, 32 3-5 sec., 68·57 miles per hour; Austin, 39 2-5 sec., 56·74 miles per hour.

Hon. C. S. Rolls, 70-h.p. Mors, v. A. Fletcher, 60-h.p. Mercedes: Fletcher, 32 4-5 sec., 68·15 miles per hour; Rolls, 35 4-5 sec., 62·44 miles per hour.

A. Rawlinson, light Darracq, v. J. Lisle, Star racer: Rawlinson, 36 2-5 sec., 61·41 miles per hour; Lisle, 37 2-5 sec., 59·77 miles per hour.

G. Higginbotham, 60-h.p. Mercedes, v. H. Austin, 36-h.p. Wolseley: Higginbotham, 32 4-5 sec., 68·15 miles per hour; Austin, 45 2-5 sec., 49·24 miles per hour.

Finally A. E. MacDonald drove the 45-h.p. Napier car over the course in 34 1-5 sec., or 65·36 miles per hour, and Mr. Fletcher a 40-h.p. Mors in 38 1-5 sec., or 58·52 miles per hour.

THE General Accident Assurance Corporation, Limited, has just issued a new motor proposal form which seems to be calculated on a very liberal scale. Policies are issued insuring against accidents to owners of cars, to the public, to the cars themselves, or in cases of burglary, theft, or larceny, as well as fire and explosion. Mr. A. Nixon is the manager of the motor department of the company's operations.

A MOTOR-CAR accident has occurred, near Clonmel, to Lady Oranmore and Miss Morley, of Portlaw. They were on their way from Bestborough to Limerick, Miss Morley driving, and had passed through Clonmel, when the car skidded on the wet road, ran into a ditch, and turned right over. Lady Oranmore was thrown out and Miss Morley was caught under the vehicle. Both ladies suffered considerable shock.

ON Tuesday of last week the French motor-cyclist, Fossier, went record hunting on a Werner machine on the Parc des Princes track, in Paris. The first attempt was spoiled by a broken plug, a second one by belt troubles, but in a third trial he set up new figures for 10 kilometres with flying start, covering the distance in 6 min. 25 4-5 sec. The fastest kilometre was made in 37 sec., equal to about 60 miles per hour.

MR. A. H. HUNT, the English representative of Messrs. Geoffroy and Delore, of Clichy-la-Garenne, France, has sent us a sample card of "Automobile Flexibles" or ignition wires for petrol motor-cars, of which he is making a speciality. The card includes several wires for the primary and no less than seven different sizes of high-tension or secondary wire. The latter are insulated by rubber, the conductors being of ample capacity.

AT Clerkenwell Sessions, a Frenchman, who gave the name of Charles J. Francois, aged 43, and described as a consulting engineer, was charged, upon indictment, with having obtained, by means of false pretences, a motor-car, valued at £180, from Mr. O. C. Selbach, motor-car dealer, of 66 and 66a, Great Russell Street, Bloomsbury. After hearing evidence, Mr. W. R. McConnell, K.C., sentenced the accused to eighteen months' imprisonment.

A MOTOR-VEHICLE supplied by Messrs. T. Coulthard and Company, Ltd., to the Mersey Dock and Harbour Board, recently took with a trailing vehicle along the Mersey Docks a weight of 14 tons 4 cwt., this being 50 per cent. more than the makers recommend customers to put upon the vehicles even with trailers. The weight was investigated by Mr. Lyster's assistant, and there was no doubt about this being the correct weight taken by the motor and trailer.

MOTOR-CYCLING NEWS.

"THE Motor-Bicycle: How to get the most out of it," is the title of a well-got-up pamphlet which has just been issued by the Ariel Cycle Company, Limited. Besides describing Ariel motor-bicycles, the booklet contains useful hints, in addition to which the various parts of a motor-bicycle, such as the engine, carburettor, etc., are not only described but are illustrated by clearly-drawn sectional views.

THE Manchester Motor Cycle Club has just been organised, with Mr. J. H. Baynes as first president. The annual subscription has been fixed at 10s. 6d.; this including a badge for each member. The Trafford Arms Hotel, Old Trafford, on the main road leading into Cheshire, has been appointed headquarters of the club.

At a Sub-Committee meeting of the Auto-Cycle Club to discuss the question of racing standards for 1904, it was considered desirable to obtain the views of the manufacturers before making any definite standards. The following proposals have been made for engines for track racing only, and the Committee consider that high powered engines should be excluded on the ground of safety, as it is found that existing tracks are not safe enough for the very high powered engines that have been in use during the past season. The Committee have agreed generally to abandon classification by weight limit, and propose:—1. That there shall be but one class—engines to have a maximum cylinder capacity of say 76 by 76; or, 2. That there be two classes, one for engines not exceeding 70 by 70, and the other for engines not exceeding 80 by 80. Observations on these points will be welcomed by Mr. F. Straight, the secretary of the Club.

To meet the demands of small cycle makers who wish to build up their own motor-cycles, Messrs. Brown Bros., Limited, have just brought out a set of fittings for a 2½-h.p. belt-driven motor-bicycle. The parts supplied are depicted in the accompanying illustration, and comprise all the necessary tubes and components for the bicycle parts of the machine, a 2½-h.p. vertical motor (74 mm. bore, 76 mm. stroke) with "make and break" contact breaker, exhaust valve lifter, silencer, Longuemare carburettor with throttle, belt rim,

7ft. 6in. "Duco" V-shaped three ply leather belting, tank, coil, 18 ampere-hour accumulator, switch handles, ignition wires,

interrupter, sparking plug, etc. In fact, the set is complete even to every tube, clip, and other small parts so awkward to make, leaving only the wheels to be built by the cycle maker.

THE CITY AND SUBURBAN DOCTOR'S ELECTRICAL BROUGHAM.

ONE of the latest productions of the City and Suburban Electric Carriage Company is the electrical brougham for the use of medical men illustrated herewith. The vehicle has inside accommodation for two persons and for one beside the driver, whose seat is on a level with that of the inside

The City and Suburban Miniature Electric Brougham.

passengers. The mechanical arrangement differs from the City and Suburban carriages in several points. In the first place, it is propelled by a single motor of 5-h.p. instead of by a pair, the rear axle being driven direct from the motor spindle through single reduction spur gearing. The battery consists of 42 cells of 100 ampere-hour capacity, divided into two groups, one being placed beneath the driver's seat in front and the other under the passengers' seats behind the body of the carriage. On level good-surface roads the carriage will run upwards of thirty-five miles on a single charge at top speed. The dense shadow seen in the illustration beneath the body of the carriage is not due to the employment of an underslung battery or straight chassis, but is merely an effect of light and shade which might have been removed by the engraver. As will be seen, steering is effected by means of a wheel mounted on an inclined pillar, on which is mounted the controller. The latter is arranged to give four forward and two reverse speeds, the maximum speed ahead being approximately sixteen miles an hour. Another feature of the miniature brougham—the name given to the new vehicle—is the roof extension, the driver being protected in great measure from rain by a glass panel, hinged at the top, which can be let down in front. In the illustration the panel is shown raised and secured to the under side of the canopy. The road wheels are fitted with Collier pneumatic tyres, and as the car has a long wheel base, and extra long and flexible springs are employed, the riding is particularly easy.

THE other day the Pioneer Company's motor-car was conveying a party from Beccles to Lowestoft, when on passing North Cove a cottage was seen to be on fire. Mr. H. Bateman, sen., the driver, promptly turned his car round, and ran back 3½ miles to Beccles, to give the alarm. This was the first intimation that had been received of the outbreak.

CONTINENTAL NOTES.

THE hill-climbing trial at Chateau-Thierry began on Sunday at two o'clock. The weather all the morning had been most threatening, and indeed the night before it left the road drenched and muddy; but the dry, strong wind soon dried up the mud, and brought the road into fair condition, so that the competition could begin promptly. The weighing-in had taken place the afternoon before at the sugar refinery of MM. Benedic and Thorailier, under the control of Messrs. Longuemare and Lepretre, and upwards of fifty cars had presented themselves for this formality. The competition was for the best time for a kilometre uphill with a standing start.

THE races for tourists took place first, and began with motor-cycles with a cylinder capacity of not more than one-fourth of a litre. In this class Peugeot was successful, winning the first, second, and third places, and doing the distance in 1 min. 11 2-5 sec., or an average speed of more than fifty kilometres an hour, that is to say, thirty-one miles. The next class was for cars costing less than 4,000 fr. There were three competitors, and Davaux on a Prosper Lambert car was the winner, the time

1 4-5 sec. There were altogether twelve competitors in this class, but two of the riders had to be pushed at the start and therefore lost their right to classification. The voiturettes of less than 400 kilos were next, and the first and second places fell to Darracq, Wagner doing the distance in 50 4-5 sec., and Villemain in 52 3-5 sec.

AFTER the voiturette competition had been completed, it began to rain and presently came down in torrents, so heavily that it was found necessary to suspend the meeting, and the spectators and organisers waited vainly for the rain to pass off and the road to become practicable. At last it was decided to give up the competition for the day and to run it off early on the following morning. The Sunday's meeting passed off without the slightest accident or hitch, and the road was kept quite clear of spectators, who, although they came in their thousands to witness the race, seemed quite content to keep inside the wire barrier which protected the edge of the pavement.

THE Chateau-Thierry meeting was concluded in fine weather on Monday morning. Danjean, on a Georges Richard, won the light-car class in 50 1-5 sec., Brazier, on a similar vehicle,

Rasson on the "X" Racer.

The Georges Richard Light Racer.

THE CHATEAU-THIERRY HILL CLIMB.

being 3 min. 6 1-5 sec. In the next class for cars of a price of 4,000 fr. to 8,000 fr., Renault was the winner on a 10-h.p. Peugeot in 2 min. 25 2-5 sec. In the class for cars between 8,000 fr. to 12,000 fr., Pelzer on a Gardner-Serpollet beat the other two competitors, and did the distance in 1 min. 15 2-5 sec. In the class for cars between 12,000 fr. to 18,000 fr. there were seven competitors, and Beconnais on a Darracq was the winner in 56 2-5 sec., whilst the second place was taken by De Maigret on a Gobron-Brillié in 1 min. 20 4-5 sec. There were two cars between the prices of 18,000 fr. to 25,000 fr., and Caillois on a new car, which for the time being is designated by the letter X, was the winner in 1 min. 32 1-5 sec. The class for cars of a value of more than 25,000 fr. was a battle between Gabriel on a Paris-Madrid Mors, and Heath on the Panhard that was steered by René de Knyff in the Gordon Bennett race. Gabriel was the winner in 56 2-5 sec., Heath's time being 1 min. 3 2-5 sec. Some trials to break the record were made, but were not successful. This ended the tourists' class.

IN the competition for racing vehicles, motor-cycles had the first innings, and Lamberjack on a Griffon took the first place in 55 3-5 sec. He also took the second place on another Griffon in 1 min. 1 1-5 sec., Berger being third on a Moto-Cardan in 1 min.

being second in 52 4-5 sec. The racing-car class proved a victory for Rigolly on the Gobron-Brillié (time, 45 1-5 sec.). Duray, on a similar car, was only 3-5 sec. slower. In the general classification Gabriel heads the touring section with 56 2-5 sec., and Rigolly the racing category with 45 1-5 sec.

"Le Monde Sportif," which is taking an active part in the organisation of automobile competitions, now proposes to hold a Criterium de Régularité, on the lines of the Reliability Trials just held in England. It is proposed that it shall be held from November 30th to December 5th, under the direction of M. Forestier, the Chairman of the Technical Committee of the A.C.F.

THE Paris Motor Car Exhibition is in serious difficulties. The organisers are overwhelmed with entries. I ran across M. Rives, the chief organiser, the other day, and learned from him that it had been found necessary to further reduce the spaces to be allotted to the manufacturers in the central nave. Not only had it been found necessary to make this reduction, which will bring down the largest stand to an area of 65 square metres, but even then the great nave will not hold all the manufacturers, and many will have to be content with stands elsewhere. M. Rives is a most popular

man, and everybody likes him, but this time his task is impossible. He cannot please everybody, and he feels it very much; for, whatever decision he comes to, somebody will be sure to be dissatisfied.

THE tonneau and limousine bodies have lived their day. They are decidedly going out of fashion. On every side I hear

The Recent Race Meeting at Spa. Baron de Crawhez starting on his Mors.

of longer chassis, and longer wheel base, in order to permit the entrance to the back part of the car to be put at the side. The tonneau was made for ladies and is nearly always occupied by ladies, and naturally they object to have to get out in the mud at the back of the car, as they have at present.

THE bonnet competition, to which I referred last week, has brought upwards of 200 designs, the greater part of which are too fantastic to bring them within the range of possibility. It has been found by the jury very difficult to make a choice amongst the practicable designs. They have therefore decided to build examples of some of the best, and exhibit them at the Paris Salon, and make their choice after having seen them executed.

THE GERMAN AUTOMOBILE CLUB have decided to call an international conference of all the automobile clubs of the world on the subject of speed; whether it should be limited, and, if so, what limit should be given to it. The origin of this conference is to be found in Dr. Max Levin-Stoelting, who is an assistant judge in Berlin, and president of the racing committee of the German Club, and who seems to become terrified by the speed which automobiles have attained. Of the six great international clubs, that is to say, English, French, German, Belgian, American, and Austrian, the German Club is without any doubt the least capable of giving judgment about speed, for the simple reason that there are less touring automobiles in Germany, perhaps, than in any of the other countries mentioned, and certainly less competitions for speed either on the level or uphill. It is therefore in the eternal fitness of things that the German Club should identify itself with calling a halt, and it is to be hoped that the other clubs will have the good sense to stifle such an attempt to stop progress; for, whatever may be the speed limit which is safe and which should not be exceeded for touring, it cannot be denied that the speed competitions of the past have gradually built up the best automobile touring car of to-day. To take one instance out of a hundred which I could mention: Had it not been for the great road races, the pneumatic tyre of to-day would not have been so perfect, for it was in making efforts to win the races that the great manufacturers of tyres found the improvements which they now add to every touring tyre.

THE "SCOTT" STEAM WAGON.

THE accompanying illustration shows a new steam wagon designed and built by Mr. G. D. Scott, of the Castle Works, Duffield, near Derby. It is designed to carry a load of about two tons at speeds varying from eight to ten miles per hour, the weight of the vehicle being about two tons. There are a number of special features in the design of the vehicle with which we hope to deal in a later issue. In the meantime we may mention that the boiler (a wet one) is of simple construction, being merely a plain cylinder with a removable cover, and fitted with concentric rings of Field tubes with a common petroleum lamp in the middle. These tubes are covered with radiators, which greatly increase their efficiency. The boiler cover can be quickly removed for examination and cleaning, when every part is visible and accessible. Heavy petroleum is the fuel used, the burner being regulated automatically. The engines, valve gear, and equalising gear are all enclosed in an oil-tight casing, and lubricated from one oil bath. This casing forms the driving axle of the vehicle and is termed a motor axle. The latter is provided with extended sleeves or hollow spindles carrying the driving wheels, which are mounted loose thereon, and lubricated from the oil bath above referred to. By this means a large wearing surface is secured, and all dust is excluded. The wheels are driven by a square shaft, which fits loosely into a square hole in the dust cap, so that the wear which takes place on the under side of this sleeve does not affect the alignment of the gearing, and both crank and counter-shaft are entirely relieved from pressure. The crank shaft and the reducing gear are concentric with the driving wheels. The equalising gear is an entirely new design on a totally different principle to that which is in general use, and is so arranged that the power is not transmitted through it, but direct from the engines to the driving wheels. The equalising gear itself does not move at all on a straight road, and only very slightly when turning a corner. The motor axle is entirely independent of the frame of the vehicle, and can be readily detached by disconnecting the springs and pipes, or the engines and gearing can be removed from the axle without detaching the latter from the car. This independence opens out the way for the introduction of an entirely new system of heavy traction, whereby either one or both axles of a

trailer can be fitted with motor axles, and supplied with steam from the boiler in the leading vehicle, thus virtually making the leader and trailer into a locomotive with four or six coupled wheels. Mr. Scott is also building three and five-ton vehicles on his system, and has granted a manufacturing licence to an engineering firm in Derby, so that more of them is likely to be heard in the near future.

A MOTOR CARAVAN.

THERE have been many proposals to construct a motor caravan, but it has remained for M. Jules Secrestat, a member of the Bordeaux Automobile Club, to carry the idea into practice, this gentleman having recently had the novel vehicle illustrated herewith constructed to his order with the view of touring at leisure in the valley of the Loire. The car, which has been named "La Bourlinguette," in appearance is somewhat on the lines of a self-propelled railway coach, the interior being furnished in the most luxurious and unique style as a travelling caravan. The vehicle is fitted with a 20-h.p. Panhard motor, and with a change gear capable of giving speeds of 6, 12, 22, and 30 kiloms. per hour. The dimensions of the caravan are: length, 23ft., width 8½ft., and height 6½ft. The total weight,

STANDARDISATION OF RACING CARS.

WRITING to an American contemporary, Mr. J. A. Kingman remarks that automobile racing has done much to develop and improve the automobile. "As a protagonist of racing I want to see racing continued, but firmly believe that if racing cars continue to be built with no restriction beyond that of weight no good can result. It is my opinion, and the opinion of many with whom I have talked, that a reasonable standardisation of racing machines will give the designer a fine opportunity to show his skill; that racing as a sport will be greatly benefited; and, most important of all, the motor-car will be developed along rational lines."

Mr. Kingman is desirous of starting a discussion on the matter, and proposes the following tentative set of rules:—1. This

The Motor Caravan "La Bourlinguette."

[Le Routier.]

including five passengers and all necessary provisions for travelling, is about 3½ tons. The interior is divided into three compartments, the centre one serving as the drawing room, dining room, or bedroom. Great ingenuity has been employed in the way of economising space. Four beds can be made up in the car at night, and during the day-time the seats and tables are so arranged that if necessary dinner for eight can be served without the smallest inconvenience. The tables are really lavatories in disguise, and are almost instantly convertible from one use to the other. They can be used as separate tables or be quickly joined up to make one long one. The kitchen arrangements are at the end of the car, the "cab" in front for the driver being entirely closed off from the other part of the vehicle. Owing to the weight, pneumatic tyres have been dispensed with, but a special system of suspension has, states "La France Automobile," in a large measure compensated for the necessity of having to use iron tyres.

weight of the racing vehicle complete shall not exceed 1,000 kilos. 2. If it be desired to divide racing vehicles into classes, the classification shall be solely by weight. In all classes, however, there shall be a certain fixed ratio between the total volume of cylinder capacity and the weight of the complete car, assuming, of course, that the cylinders are single acting. 3. There shall be a certain ratio between the weight of the chassis and the weight of the complete racing vehicle. As racing machines are built at present the chassis and the vehicle ready for the road are practically one and the same thing.

We shall be glad to have the opinions of our readers on Mr. Kingman's proposals.

THE Coventry road through Barnet is in a deplorable condition; owing to the trams that are being laid down *via* Finchley, quite a mile of the road is "up."

SOME USEFUL NOTES.

THERE are unfortunately many motorists who think that their car is all right till it breaks down or stops, and then they sit down and wonder how it came to happen so suddenly and without warning. The efficient driver, however, endeavours to prevent troubles, rather than wait till they overtake him, as likely as not out in the country miles from any place where he can procure the tools or assistance necessary for a remedy. Do not make the mistake of thinking that it is necessary, with a good machine, to be always worrying about accidents that may never happen; but the prudent motorist will keep a vehicle in correct adjustment all the time, to do which he realizes that a thorough knowledge of all parts of the machine is necessary in order that he may give it the required attention, with a minimum expenditure of time and energy. One of the things about a petrol motor which causes considerable trouble to the novice and the experienced automobilist alike is the compression. Compression

where only one alone would have had no material effect. In any event, the feeding of too much lubricating oil, or too much gas, results in a deposit of carbon in the cylinder. If too much fuel is fed, this deposit is due to the imperfect combustion which takes place, producing among other things a smoky exhaust. If over-lubrication is the cause, the excess oil gradually works into the combustion chamber, and is burned by the intense heat of explosion. A poor grade of lubricating oil cannot stand the excessive heat and burns. Not only does this carbon deposit on the sparking points, but it mixes with the lubricating oil, forming a sticky, gummy oil, which collects in the piston grooves. When the motor cools this becomes all the more gummy, and it binds the piston rings in their grooves, preventing them from springing out and making a tight connection with the cylinder.

THE remedy for such a condition of affairs is, of course, to throttle the mixture to the proper point, reduce the quantity of lubricating oil fed, or to secure a proper quality of lubricat-

Interior of Motor Caravan. (See page 620)

is, in some respects, so elusive and intangible that it slips away, here and there, and the automobilist may have a hard time restraining it. But if compression is intangible, the parts of the motor which are expected to produce it are not, and these, remarks the "Automobile Magazine," may be examined, tested and adjusted with comparatively little difficulty, unless the motor is badly worn.

A PRIME essential for good compression is a set of piston rings, which expand nicely in the cylinder, and form a good, airtight joint between the piston and cylinder. When considerable wear occurs in the cylinder, on the piston or the rings, the compression is not good and new parts may be required. In some cases, however, the difficulty may be due to a very simple error on the part of the motorist—that of furnishing too much lubricating oil, or a poor grade of oil, to the cylinder. In case the carburettor is not throttled properly and gives the motor too much mixture the same result may be produced, or the three causes may exist together and thereby increase the difficulty or cause it

ing oil, depending, naturally, on which cause is responsible for the difficulty. In any event the piston should be taken out of the cylinder as soon as possible, and the rings loosened by an application of petrol or kerosene. After cleaning the rings, grooves, piston and cylinder of all deposits, the motor may be put together again, and the compression will be found to be all right, providing the difficulty was not due to some other cause than the piston rings being gummed and stuck in their grooves.

IN making repairs to parts of the motor always examine carefully to see that the exact sizes are duplicated, and the cams, etc., are set at exactly the same point as when the engine came from the makers. It is a good plan to mark the gear teeth before disconnecting the parts; you can then readily replace them in the correct position.

MR. C. W. S. CRAWLEY will read a paper on "Limitation of Cylinder Capacity" at the Automobile Club on Nov. 12th.

THE USE OF OIL IN ROAD IMPROVEMENT.*

BY JAMES W. ABBOTT.

PUBLIC attention was first called to the utility of crude petroleum oil in road improvement through experiments made by the county of Los Angeles, in California, in 1898, where six miles of road were oiled in that year under the direction of the supervisors. The sole purpose of this work was to lay the dust, which, churned beneath the wheels of yearly increasing travel during the long dry seasons in that region, had become a most serious nuisance. The following year this mileage was a little more than doubled in that county, and other counties in California also began experiments along the same line.

From the very first the results obtained were so astonishingly successful that the practice rapidly increased. It spread through every county in Southern California, and then began to work north. Now, after five seasons, it has extended from near the Mexican line, on the south, to Durham, in Butte County, on the north, a stretch covering sections of quite widely differing climatic conditions, with an aggregate of about 750 miles of county roads and city streets oiled for one or more years. The practice has now passed the experimental stage. More than twenty-five counties in California have already adopted it, and others are preparing to do so.

As already stated, the original motive for the use of crude oil on roads was to lay the dust. Wherever oil has been tried this purpose has invariably been accomplished, regardless of methods adopted or variety of oil used. On all kinds of roads where it has been applied the dust has ceased absolutely for at least an entire season after its application, and, if renewed a second year, has been abated for that year also and the following, whether then treated or not. In Southern California all unite in saying that the great bane of life—dust—passed away wherever the first application of oil was made. The dust raised by passing travel no longer comes in at windows or destroys the products of field and orchard for considerable widths on each side of the road, as it formerly did. The report of its effectiveness as a dust layer is equally positive and enthusiastic from all sections which have made the experiments.

In California it was soon learned that, incalculably valuable as it was, the laying of dust was not the only or even the most extraordinary result obtained. It was found that when the oil was applied it immediately began to bind together all the loose particles constituting the road surface, whether clay, sandy loam, loose sand, gravel, or the fine material on the top of macadam. A tough stratum formed, resembling an asphalt pavement. Roads built on drifting sand or clayey dust, no matter how deep, where trotting with a horse and trap was impossible and for a pair of strong horses to pull a ton was a very laborious process, became indurated, resilient, and firm, so that driving teams could trot with ease and the same pair of horses pull two and one-half tons more comfortably than they formerly did the one ton. Of course, these results were not fully obtained immediately, but they never failed to follow persistent treatment with oil. At first, while this oiled surface stratum was thin, it was often broken through, especially in wet weather, but proper repairs and subsequent applications of oil thickened and strengthened it until it would at all times effectually withstand the heaviest and most continuous travel.

When they first began to use oil on roads in California there was much speculation as to whether it would not be found objectionable; but when properly applied, and suitable precautions were taken not to use the road before it was ready, the theoretical objections vanished. When oil was placed upon the surface of the road, if vehicles were allowed to run over it before it had sunk in and become thoroughly incorporated with the road material, the wheels picked up the oil and threw it in all directions, injuring clothing and everything else of a delicate nature

upon which it fell. After experience had taught how to avoid this, no further serious difficulties manifested themselves.

There does not appear to be such a thing as dust from an oiled road. Of course, dust from outside may blow on to an oiled road, but this soon adheres to the oiled surfaces and ceases to rise.

The mud from oil-treated roads, after the oil has become thoroughly diffused through the material, does not appear to be more objectionable than ordinary mud.

Diligent inquiries about the effect of oiled roads on rubber tyres failed to disclose any complaints, except in cases where the tire had come in direct contact with the oil. So far from being injurious, the claim is made by some that the resiliency of an oiled road surface and the protection against the sharp edges of sand and gravel increase the life of rubber tires very materially. It has not been uncommon for asphalt pavements in cities to become softened by the heat of the sun to such a degree as to be injured by the wheels of heavily-loaded wagons. No difficulty of this character is ever experienced with the surface of an oiled road. For a short time after oil is applied there is a very perceptible odour, which soon disappears almost entirely. While it lasts it is not essentially disagreeable, and many people rather like it. An incidental advantage of oil on roads is the help to the eyes. The reflection of the sun from white road surfaces and the dust blown into the eyes are both very trying. Oiling gives the road a seal brown colour.

The growth of oil in popular favour in Southern California has been steady and rapid. Many of those who have had experience with it have come to regard its use in a dry region as the most important discovery ever made in road making. Quite a considerable number of people have said to the writer, "We could not go back to the old conditions; if we had to give up our oiled roads we would move away."

All petroleum will lay dust, but asphalt is required to bind together the loose particles of a road surface. As soon as petroleum is put on a road all the lighter hydro-carbons which it contains begin to evaporate whenever the temperature is reached at which they vapourize. After a time nothing but the heavier ones remain.

From the very beginning of the use of crude oil for roads in California it seems to have been understood that it was the asphalt in the oil which acted as the binder, and consequently they have always sought very heavy oils for that purpose.

Instead of crude oil, asphalt residuums, from which the lighter products have been distilled, have been much used on roads in California, but no observations have been made to determine whether the results have been more satisfactory in proportion to the amounts used. In the few experiments made with oils on roads in the United States outside of California and Texas a residuum from paraffin crude oils has generally been used of about 26° B. While these experiments have always been successful in laying dust, they have not been followed up with sufficient persistency to demonstrate any efficacy of this material as a road maker. It is known that many of the hydrocarbons will under certain conditions form a chemical union with oxygen and nitrogen, producing a small percentage of asphalt. It is possible that if roads were repeatedly sprinkled with any crude oil it might be found in time that the oxygen and nitrogen of the atmosphere had united with them and produced some asphalt of enduring value to the road.

Without precedent anywhere for a guide, naturally the first experiments were tentative and differed in method according to the theories and ingenuity of those entrusted with their execution. For a time it was quite strenuously argued by many that it was the better practice to apply the oil to a road surface while it was moist like an orchard soil when it works well. It was contended that the water and the lighter oils evaporating together would effect a more desirable result than could be secured without water. This view is now unanimously rejected by all experts in road oiling. While all agree in advocating liberal sprinkling in preparing the road surface, the aim is to let the water all evaporate before the oil is applied.

(To be continued.)

* Extracts from the Year Book of the United States Department of Agriculture for 1902.

HERE AND THERE.

DIVIDEND warrants have been issued by the Motor Manufacturing Co., Limited.

THE Herefordshire Automobile Club is holding a motor-cycle hill-climbing contest on Callow Hill to-day (Friday).

HEREWITH we illustrate the new "Begbie-Oleo" sparking plug which has lately been put on the market by the Begbie Manufacturing Company, Limited. The plug, which is now being fitted on all Aster engines and adopted by several of the leading French motor-car builders, is claimed to possess a number

of advantages. As will be seen, the plug is very short, measuring $2\frac{3}{4}$ in. over all; the porcelain is very thick, and, being of the best quality, is stated to be practically unbreakable. Furthermore, the shape of the interior of the porcelain prevents the plug from fouling.

THE Sheffield and District Automobile Club will hold a run to Sickleholme to-day (Saturday).

JENATZY is expected to take part in the track races which are to be held in Berlin by the German Automobile Club on the 18th inst.

It is reported that Messrs. Panhard and Levassor are about to establish works in the United States for the repair of Panhard cars, of which a large number are used by American motorists.

THE Dundee Harbour Trust has been considering a proposal that they should give ground for the erection of a petrol store. It was decided to recommend that a site should be given at the east end of the harbour.

THE Brighton papers have lately been full of cases of untended horses indulging in sprinting matches at their own sweet will, smashing the vehicles to which they were attached, scattering pedestrians, and alarming shopkeepers.

MESSRS. H. JOHNSON AND CO., LIMITED, has been registered with a capital of £5,000 to adopt an agreement with Messrs. H. Johnson and Co. for the acquisition of the business carried on by them at Harrogate, and to carry on the trade of automobile engineers.

At the Eastern Ainsty Petty Sessions at York Castle, the Chairman, Mr. W. B. Richardson, referring to the impending removal on promotion of Superintendent Knight from Tadcaster to Leeds, expressed satisfaction with the way in which he had discharged his duties. Drivers of motor-cars, he added, would rejoice at the departure of Superintendent Knight.

At a meeting of the Council of the Lancashire Farmers Association at Preston, the following resolution was adopted:—"That the injury to the roads caused by heavy pleasure traffic and motor-wagons is creating a serious additional charge on the local roads, and it is desirable that measures be taken by the proper authorities to deal with this matter." It was decided to send this resolution to the Main Roads and Bridges Committee of Lancashire and various district councils.

MESSRS. DE DION-BOUTON, LIMITED, have just issued an interesting catalogue showing some industrial applications of the De Dion petrol motor, among these being a small house electric lighting plant, a portable electric lighting set, a belt-pulley motor combination for machine-tool driving purposes, and a combined engine and pump. In France an increasing use is being made of petrol motors where a small amount of power is required in a portable and convenient form, and we recommend the new combinations to motor-car repairers.

THE Leon Bollée Motor Syndicate, Limited, has been registered with a capital of £10,000.

SIR JOHN DICKSON POYNTER, M.P., has sold his Wolseley car through the Motor Mart, Limited.

OWING to his leaving Vienna, Count Carl Schonborn is resigning the presidency of the Austrian Automobile Club.

MOTORISTS in the Cardiff district will be interested in learning that the electric light department of the borough is prepared to undertake accumulator charging.

It has been held by Judge Emden in the Lambeth County Court that the possession of a motor-car is not evidence of a debtor's means, though it might be of his extravagance.

THE Rev. A. C. Oliver, of Barlaston, Stoke-on-Trent, an ardent motorist, has recently completed a tour on his 6-h.p. De Dion over Shap Fells, and to the borders of Scotland, returning via Lake District and Blackpool.

FROM Boston to New York in an electric automobile is a feat soon to be undertaken by Mr. F. A. Babcock, of Buffalo, who is building a special car for the purpose. The distance is 235 miles and the through trip has never been made by an electric vehicle, but Mr. Babcock is confident that it can be done.

AN interesting motor-vehicle has just been completed by the United States Long Distance Automobile Co., of Jersey City, for the U.S. War Department. The vehicle, which is intended to be used as an automobile repair shop to accompany light artillery, cavalry, and infantry in field service, is elaborately equipped with machinery and tools and stocked with materials for repairing on the spot breakages and injuries to field guns and army wagons, to re-shoe the horses and mend the harness and saddles, and to do emergency carpentry work. The box-like body has doors on both sides and at the rear which rise on hinges, giving access to the interior. In one side there is a small lathe for turning metal. This is driven by a small single-cylinder petrol motor carried by the side member of the steel angle-iron main frame of the vehicle below the lathe. In the

opposite side of the body are a series of drawers and compartments for the storage of tools and materials of all sorts, and in the rear there is a small blacksmith's forge and anvil. The auxiliary motor which drives the lathe also turns a grindstone and a dynamo. At the front of the vehicle, suspended below the steel frame, is a double windlass, which is turned by the motor, and by which the wagon can, if necessary, pull itself out of a hole. A pair of extra artillery wheels and a number of heavy poles are carried on the "roof." The vehicle itself is $12\frac{1}{2}$ feet long, and, stripped of its equipment, weighs $3\frac{1}{2}$ tons. Motive power is furnished by a 24-h.p. four-cylinder vertical petrol engine mounted just below and to the rear of the driver's seat. The maximum speed of the vehicle on good roads is ten miles an hour.

THE Car and General Insurance Corporation, Limited, has been registered with a capital of £100,000.

DIVIDEND warrants on the 6 per cent. preference shares in Brown Bros., Limited, have been posted.

ONE of our readers, Mr. W. Simons, has been kind enough to send us the photo reproduced herewith, and which was taken on the Southsea run of the 1,000 miles Reliability Trials. The driver of the 10-h.p. Hallamshire car, No. 43, not wishing to

wait to give warning of the police trap to the next vehicle, which was some considerable distance behind, a happy thought struck one of the party to write the warning across the road, which was done in French chalk. The spot was about two miles the other side of Liphook.

A LEADING Durham firm of flour millers, who have adopted the motor-vehicle in connection with their business, inform us that the comparison in cost between that system and horse-drawn vehicles shows a gain of 25 per cent.

CONSTERNATION reigns in motoring circles in Lubeck, Germany, where the municipal authorities have issued a regulation that the speed of motor-cars in the town must not exceed five kilometres (about three miles) per hour.

THE following French makers have made application for space at the St. Louis Exhibition:—Darracq, Jeantaud, Mors, Gardner-Serpollet, Renault, Panhard-Levassor, de Dietrich, Clement, Fouillaron, Michelin, Turgan-Foy, Pozzy-Potron, Georges Richard, Aster, and Cottereau.

MR. W. HARDMAN, of Langley Park, Sutton, has recently returned from an enjoyable and successful tour on his 15-h.p. Mors, having covered a distance of 1,059 miles through the Midlands and North and South Wales, practically without a hitch of any kind. He reports that he was not once in difficulty with the car, or had occasion to stop to make any kind of adjustment *en route*.

DATES have been provisionally selected for next winter's tournament of the Florida East Coast Automobile Association. It will continue two weeks, opening on January 25 and closing on February 6. The Ormond-Daytona Beach is the most unique speed course in the world. At low tide the beach is a hundred yards wide, and as hard as cement. The racers can go at top speed for twenty miles without meeting with any obstacle.

THE Motorist's Diary, compiled by Mr. Charles Heidsieck, of Rheims, has been published in England by Mr. C. C. Lewis at 110, Fenchurch Street, E.C., and contains a hundred ruled pages in which space is left for the tabulation of particulars regarding automobile runs, including consumption of petrol, etc., stoppages, mileage, etc. Lists of hotels, a directory of petrol sellers, lists of members of some of the leading automobile clubs, synopsis of legislation with regard to the subject, and "hints on champagne" make up a useful little book.

MESSRS. BEARD BROTHERS, of High Street, Cricklewood, have laid down special plant for the repair of cars.

MR. A. WATSON has established a garage at Bishopton Lane, Stockton-on-Tees, where he has accommodation for twenty-five cars.

MR. F. BODEN, of Cheetham Hill Road, Manchester, having secured a licence, is now in a position to supply petrol at any hour of the day or night.

MR. TUFF, the new M.P. for Rochester, has promised that he "will not assist in any further restrictions of the most important automobile industry."

ON Saturday next, the 17th inst., the Western Section of the Scottish Automobile Club will hold its anniversary run to Troon, meeting in Glasgow at 12.30 p.m.

THE Brotherhood-Crocker Motors, Limited, has been registered with a capital of £20,000 in £10 shares, to manufacture, store, repair, and deal in motors, etc.

THE American Motor League has devised a series of nine road signs similar to the warning signs that are in use in France and is erecting them through its local consuls.

AFTER the return to its home in Essex of the Chelmsford steam car that went through the recent trials it proceeded at once to Cambridge for the use of a shooting party.

PHOENIX MOTORS, LIMITED, are now able to charge electrical cars, the necessary plant for the purpose having lately been installed at their works in Blundell Street, King's Cross, N.

SOME important changes are, we understand, taking place with regard to the manufacture of the Clement cars in France, and in the agencies for the same in this country. La Société Clement-Gladator is about to open a depot at 3, Leicester Street, Leicester Square, W.C., for the sale of Clement cars, under the management of Mr. E. H. Lancaster, who until recently acted as engineer to the Automobile Club.

The Reliability Trials.—Mr. W. C. White on the White Steam Car, No. 116.
(Photo by Mr. F. Coleman.)

FROM the Dunlop Pneumatic Tyre Company, Limited, comes a copy of their 1904 list of motor tyres. They are made in two varieties—beaded and wired edges. Of beaded-edge tyres two classes are made—heavy and light—the former in sizes from 2½ in. up to 5 in. or 120 mm., and in diameters from 26 to 40 in. The light beaded tyres range in size from 2½ to 3½ in. and in diameter from 26 to 34 in. The wired tyres are made in three sizes—2½ in., 3 in., and 3½ in.—and from 26 to 30 in. in diameter. The list also gives particulars of the Dunlop tyre-repair outfits, valves, gaiters, and motoring capes and coats.

THE LATEST ABOUT THE EDISON BATTERY.

IN its last issue, the "Automobile Magazine" publishes an interesting account of a visit to the works of Mr. T. Alva Edison at West Orange, U.S.A., by Mr. W. M. J. Morgan, in quest of the latest information with regard to the Edison battery. In view of the great interest shown in the latter, the following extracts from the article in question are not without their attractive side.

The world of mechanical traction has received further evidence that the Edison press agent is still alive and doing business at the old stand. He began his career months and months ago by announcing that Mr. Edison would invent a battery that would go speeding down the ages and hills faster than the winner of the Gordon Bennett race ever dreamed of going. Pleased by the rumpus he kicked up, the press agent then played his trump card by announcing that the battery would be cheaper by far than anything of the kind ever placed on the market, and that as a result the day labourer would henceforth proceed to his work in an Edison-batteried vehicle. At once a great void was filled and many labourers selected lots out in the country on which to build themselves houses, to and from which they would rapidly, safely and cheaply travel in a going-to-be Edison automobile. The play of the jocular press agent caused many people to keep a tight grip on their pocket books while declaring with emphasis that no electric vehicle manufacturer would get any £150 to £300 of theirs or anyone else's money when they could buy an Edison automobile for one-fourth of those figures. In the meanwhile they would wait for Edison. They waited; they are waiting yet, and were still waiting when the cruel press agent once more waved his red flag; but this time he short-circuited his promissory battery and came out with an absolute statement that the great Edison battery was now ready and would be greater and better and last longer and look pleasanter than any other battery that ever boiled; but he added something (which acted like an electric shock on those who had been so patiently waiting) when he concluded with the further statement that the battery would not be a cheap one. Then he gave the figures per horse power, which at once proved the Edison battery would be dearer than any other.

Making a storage battery is not quite as easy as Mr. Edison's press agent would have us believe, since it is now three years since that precious Edison battery was promised and yet where is it to-day? Less than two years ago I interviewed Mr. Edison and was told that the battery would certainly be ready in about two months. Having recovered from the Gordon Bennett races, I went over recently to West Orange, taking with me a long newspaper article which purported to give an account of the Edison "invention." The article was headed "Auto-Battery cannot break. Edison says his invention now perfected will stand all rough usage. Commercial success sure." That looked so much like real business I sailed up to the Edison laboratory and was soon anchored in the outside office. After a little delay I was piloted in to the great inventor, who was as genial and as entertaining as ever.

The newspaper article I had brought along said, among other things, that the Edison battery would be a commercial success and practicable for automobiles from every standpoint, and went on to quote Mr. Edison as having said:

"We brought our battery to perfection, and now it's up to the automobile manufacturers to build a strong machine—that won't break down. They're lots of fun to ride in, but when you go out in the country and get stranded six or seven times the fun all goes out of it. Now we have a battery here that will stand all the tests you can pile on it. And to show we did a set of batteries up in the case we pack them in when they are fitted to an automobile and then I got some of my boys to throw 'em out of the second-story window half a dozen times; and then we unpacked them and it never touched 'em."

Mr. Edison acknowledged the paternity of the above, and was enthusiastic over the construction of the Mors and Panhard

machines, and talked for a long time very entertainingly of construction in general. I tried several times to get Mr. Edison back to batteries, but I was not entirely successful, though he finally admitted that he believed he could make better time with an electric vehicle (fitted with his battery, of course), than could be made with a petrol machine in a run from New York to Chicago, particularly if the vehicle was fitted with a wonderful gear multiplier which he is getting out. Mr. Edison said this gear multiplier will make the running of an automobile through sand and mud an easy matter; in fact, he said he has great hopes that this gear will be as successful as his battery. I looked closely at the great inventor when he said this, but could detect no evidence that he intended this remark ironically.

Finally, Mr. Edison spoke of the radius of his battery and said that an ordinary 10-h.p. Edison battery would probably drive a vehicle an average of 80 miles with one charge, whilst it would be practically indestructible and would last longer than any other now in use. A 10-h.p. Edison battery would for the present cost £120. Four cells are required per horse power and 21 cells are installed in the ordinary runabout, while 38 cells will, Mr. Edison says, drive a vehicle weighing one ton 60 miles, or a delivery vehicle weighing two tons will be driven 36 miles from one charge of a battery of 36 cells.

After getting all this information and I was preparing to leave, I saw a small runabout entering the Edison yard. The runabout was towing an electric vehicle fitted with Edison batteries which had gone dead on the road. Turning to Mr. Edison I asked him what was the matter. After some testing of the cells Mr. Edison informed me that he thought the battery was short circuited. As near as I could judge no one seemed to know, at least not for publication, just what the matter was, so I had to leave possessed with serious misgivings as to the Edison battery being all that the daily papers had cracked it up to be. In fact, if my opinion is of any value, I am free to say that I have very grave doubts if the Edison battery is going to be anything like the revolutionizer of the present form of batteries Edison's admirers have predicted it would be. It is to be hoped in the meantime that no one will hesitate about buying an electric vehicle through any idea that the Edison battery is going to be the wonder worker the uninformed press prophets have told us it would be. Mr. Edison may yet get that much heralded battery of his all right. I sincerely hope he will, but just now it is quite evident that the battery is far from right.

IN Holland there has been a reliability trial which lasted four days, and entailed covering a distance of 416 miles. The weather was fine, and great interest was shown in the competition by the public along the lines of route. The competition ended by a banquet.

The Racehorse does not like the outlook.
(Das Schnauferl, Munich.)

CORRESPONDENCE.

WHIPPING MOTORISTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to the report in your issue of the 26th ult. headed "Whipping a Motorist," we may say that a somewhat similar occurrence has come to our knowledge in Essex, but it is perhaps more remarkable in that the assailant was a lady. The facts, shortly, are that a silent running car was being driven by our client at a reasonable rate in broad daylight upon a wide and straight road approaching a dogcart, in which two ladies were seated, one of whom was driving; no difficulty was experienced with the horse, and no intimation of any desire that the car should be stopped was made; whilst passing the car, which was well over on the near side, the driver of the dogcart raised her whip and slashed the driver of the car and his face across the face. Steps are now being taken to identify the offender, with a view to proceedings being instituted.

We might perhaps express the opinion that it is to be regretted that there is no central body representative of motorists, who would investigate and take action in such cases.

With reference to the query raised on page 564, as to a heavier fine being inflicted by reason of a defendant assisting other motorists to escape a trap, we might point out that it is no offence, but rather a

yards beyond him, and that I travelled the distance at the rate of 22 miles per hour. There was no corroborative evidence of any sort offered by the police as to the pace I was going. The sergeant admitted in cross-examination that I at once stated he had made a mistake, and that I offered to take him over the distance without altering a lever on the car, to prove my statement. This he refused to do, saying it was not his duty. I then went over the distance myself, going at exactly the same speed as previously, and stopped in front of the sergeant, who said he wished I had gone six yards further, as then he could have timed me, but that, as far as he could make out, I had taken about twice as long as on the previous occasion. I then went back to endeavour to obtain witnesses who saw me going over the measured distance, and found a man, but he, although stating I was going very slowly, and making some remarks about the police, refused to give his name and address, as it would damage him in his employment. I then went back to the police sergeant and informed him that the man refused to give his name and address, and asked him to go with me to obtain it, but he refused (as he admitted in Court) because his tea was getting cold! I also described the man to him, whom he said he knew very well, and he promised to send his name and address if a summons was served upon me; this he did not do. My solicitor, Mr. Douglass, endeavoured to prove that the police evidence could not be relied upon, but the magistrate stopped him, saying that had nothing whatever to do with this identical case, and practically stating that no evidence would be any good other than that of a man with a stop watch, as against the policeman's unsupported

Mr. Gardnes Williams, General Manager of De Beers Mines, Kimberley, at the helm of a Panhard Car, with Mr. Brigham, Chief Mine Surveyor (wearing soft felt hat) in the tonneau.

meritorious action, to dissuade another from continuing to commit, if already committing, or to advise him not to commit, if so contemplating, an unlawful action, and whilst doing so, there is undoubtedly no right to utilise it by way of additional penalty.

If any fine were admittedly increased by reason of such conduct, the best course would probably be to move the High Court for a mandamus to the justices, or by *certiorari* to quash the conviction, preferably the former, but in such an instance also the lack of a central body is unfortunate, as the proceedings are somewhat expensive, and many motorists nowadays are of only moderate means.—Yours truly,

TETLEY, TREE, AND TETLEY.

MOTOR CAR "JUSTICE."

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The following facts will, no doubt, be of interest to your readers as showing how absolutely impossible it is, under existing circumstances, to successfully defend an action for exceeding the speed limit. I was summoned at Kingston-on-Thames for driving on the main Portsmouth road at Cobham at a speed in excess of the legal limit. The evidence produced was a police sergeant, who stated that he had timed me over a measured 440 yards, that he started his stop watch as I passed a post 434 yards away from him and stopped it as I passed a post six

evidence and his stop watch. I may state that whilst covering the preceding mile I was warned of this identical police trap by no less than four motor-drivers and one cyclist. Consequently I took extra precaution that I was not in any way exceeding the speed limit, and both myself and my driver went into the witness box and swore we were not going at more than eight miles per hour. In spite of this, the magistrate fined me the sum of £1, stating I had exceeded the speed limit of twelve miles per hour.

In face of these facts, and seeing that the police sergeant refused to give me the least assistance in any way, shape, or form, I ask what is a motorist to do when a policeman says he exceeded the speed limit?—Yours truly,

ALFRED DUNHILL.

PREVENTING SIDE SLIP.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Thinking it may be of interest to your readers, I send the following description of an invention I have protected, which has for its object a device for counteracting side slip in motor or other vehicles and preventing puncture of the tyres thereof. The idea is to provide a brush or brushes or other suitable device attached to the vehicle and so arranged as to sweep the surface of the road and remove mud, etc.

out of the path of the wheels. They are adjustable and may be raised or lowered at will and may be driven by motor or other power (they are by preference placed somewhat diagonally), suitable guards to be provided. The brushes could, if desired, be fixed ones, instead of being made to revolve. Turning corners, in traffic and night travelling, would be its principal service.—Yours truly,

E. S. WOOLF.

A PERFECT PROTECTION FROM DIRTY PETROL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Seeing that so many motorists are worried by dirt in the petrol and consequent stoppages—a most annoying one you chronicle on page 596 which occurred to the 20-h.p. M.M.C. during the trials—may I be permitted to say that this can very easily be avoided? My trouble under this head occurred last year and culminated on the run home from the Bexhill speed contest. Although my Longuemare carburettor contains a strainer, it is in such an inaccessible position that one has to practically dismantle everything to get at it. Consequently I cut my petrol supply pipe and made and fitted therein the device shown herewith in half-size. It is fitted to the side of the body close to the step by one screw, the pipe ends being soldered to the sockets shown. It is impossible for sufficient dirt to accumulate in the chamber below the gauze, and as

G. Screw cap for inserting gauze rings
S. Attachment to car body
W. Leather washers
The gauze rings are kept in place by a spring not shown.

I always draw off from the drain whatever petrol I may require for odd purposes, it is bound to keep clean. For long runs, such as the recent trials, one could easily fit a cock in place of the bottom cap, to be opened from the dash for a momentary "blow through," if ever required. My device has been invaluable to me, and I have never experienced any further trouble, and it is very handy for drawing off petrol.—Yours truly,

FRED. H. HADFIELD.

THE MOTOR VOLUNTEERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your comment of last week aptly voices some of the discontent that is felt in connection with the much-vaunted Volunteer Corps. The proportion of officers to men is absurdly high; in fact, why there should be required officers at all is a puzzle. The duties have mainly consisted in playing the part of drivers to officers who have generally regarded them as such.

Cold comfort in barns, while men who are only one's equals are enjoying the luxury of War Office hospitality, is no compensation for the loss of time and the wear and tear of the cars that are loaned to a country which appears more inclined to smile at our efforts than appreciate our performances.—Yours truly,

PRIVATE X. Y. Z.

POLICE TRAPS AND THE RELIABILITY TRIALS.

THERE was a batch of motorists at the Horsham Petty Sessions on Saturday, the cases mostly arising in connection with the Worthing run during the Reliability Trials. The magistrates present were Mr. R. Hoper (in the chair), Sir Henry Harben, Lieutenant-Colonel Lyon, Mr. H. Padwick, and Mr. John Warren. The first defendant called was Frank Shorland, and after the police evidence had been given Colonel Lyon said, "I do not see why there should not be a mistake made. I was standing there, and I saw that motor coming up. Not only was I there, but Mrs. Lyon was there, too, and several other ladies. We could not imagine why the motor-car was stopped. I went to inquire, and found it was alleged to have been going at twenty-two miles an hour. This was impossible. I do not believe it was going more than twelve. I do know something about pace, and I saw the car coming all along North-parade." He said there was no danger to anybody, and that it was a case for dismissal. Ultimately, however, the Bench decided to convict, a fine of 10s. and costs being imposed.

MOTOR-CAR ACCIDENTS.

MR. MASSER has held an inquest at Tamworth concerning the death of James Ross, a boy aged four years. Arthur Bowden, motor-driver to Captain Allfrey, Williamstrop Park, Fairford, said he had had six months' service as a driver. On Wednesday he was driving alone in the car from Birmingham to Shenton Hall, Nuneaton, where his master was visiting. He was travelling at ten or twelve miles an hour when the accident occurred. As the car was coming down the hill he noticed a number of children by the roadside. Two crossed over before him, and the road was then quite clear for him. As he got nearer the deceased suddenly crossed the road, and was knocked down. Deceased practically ran into the car. Witness at once "threw out" the engine and applied two brakes, and the car was quickly brought to a standstill. The Coroner said there was no suggestion of any lack of care against the driver, and he thought the jury would have no difficulty in finding that it was an unpreventable accident. The jury returned a verdict to the effect that the affair was the result of a pure accident, and they exonerated the driver from blame.

A SAD accident has occurred on the main London and Brighton road, near Albourne, resulting in the death of a girl named Florence Boniface, aged eleven years, and serious injuries to another young girl. The girls were playing in the road when two motor-cars approached, one coming from the direction of Brighton and the other from London. The two children, when running across the road to avoid one car, were knocked down by the other—that which was coming from Brighton, and driven by Mr. R. L. Dawson, of the Coldstream Guards. Florence Boniface sustained very serious injuries, and expired about half-an-hour after the accident occurred. The other girl was also seriously injured. At the inquest Lieut. Dawson, of the Coldstream Guards, Aldershot, who was cautioned before giving evidence, said at the time of the accident he was driving from Brighton. It was when the car entered on the straight piece of road near Arden Grange that he saw three children playing in the road or on the grass at the side. They appeared to look in his direction, then to run backwards and forwards across the road. He put on the foot-brake, disconnected the engine, and sounded the horn. The children again ran across the road to get into the grass. Thinking the danger was over he took off the foot-brake, but one girl darted off the grass into the road, followed by two others. He at once turned the car into the grass. Then the girls also turned back, and one was struck by the front of the car, which travelled a few yards further and stopped on a heap of flint. He saw two children lying close to the car. He and his companions at once did all they possibly could for them. The jury returned a verdict of "Accidental death," adding that no blame was attached to Lieut. Dawson.

CARRYING MOTOR SPIRIT.

AT Penge police court, on Tuesday, Robert Fowler, of Poplar, was fined for driving a horse and van without a light.—The defence was that Fowler was carrying motor spirit for the motors in the Crystal Palace trials, and when the light went out it was dangerous to relight it.—The Chairman: I think it is a very dangerous commodity to take about the streets.

FURIOUS DRIVING.

POLICE SERGEANT BINSTED secured eight convictions at Chertsey, the other day, against motorists caught at B. shot. After the cases had been heard Mr. T. Neame, one of the defendants, summoned P.C. Gould for assaulting him. Mr. Chaldecott prosecuted, and the constable entered a plea of not guilty. For the prosecution it was contended that the constable, when he stopped defendant, took hold of his motor-bicycle and pushed him off; then he fell with the machine on top of him. After hearing the police evidence the Bench dismissed the case.

AT Stratford-on-Avon, several charges have been gone into with respect to motorists exceeding twelve miles an hour. On September 12th, the police laid a trap on the Banbury road, with the result that proceedings were instituted against several drivers. In the charge against Mr. Thomas C. Aveling, of Meridan Street, Birmingham, the police said the car was going at 24 or 25 miles an hour, the 440 yards being completed in 37 seconds. But another car was also on the road a very few yards behind the defendant's. The police said this one was also going faster than Mr. Aveling's, and overtook it just after it had completed the quarter of a mile. The defence, however, put it that the second car overtook theirs on the measured track, so that the police took the wrong time. Mr. Johnson, for the defence, also asked to see the watches with which the timing was done, but these were not in court, and the case was adjourned for their production.

AT Dundalk, Major Fortescue, Deputy Lieutenant, magistrate and High Sheriff for County Louth, of Stephenstown House, Dundalk, was fined £5 and costs for driving his motor-car through the town of Dundalk at a speed of about fourteen miles an hour. Captain the Hon. Harry de Vere Pery, the presiding magistrate, said, in imposing the fine, that the public must be protected from excessive driving of motor-cars and bicycles.

AT the Christchurch Petty Sessions, before the Mayor and ex-Mayor, the Hon. E. W. Douglas, General Sir Charles Shute, and Major-General

Galloway, a number of motorists have been summoned for having travelled at various speeds in excess of the twelve miles an hour legal limit. In the case of A. Ralph, the chairman said the Bench were divided in opinion, and the case must therefore fall to the ground. Wm. Nash pleaded guilty to a charge of furious motor driving, but urged as an excuse that he was driving Dr. B. Scott to see Captain Hunter, who was seriously ill, and who had since died. This did not prevent his being fined.

* Indicates Motor-Cycle Cases.

THE POSSESSION OF A MOTOR-CYCLE.

At the Stratford Police Court, on Saturday, the Commissioner of the Metropolitan Police was summoned for refusing to deliver up a motor-cycle, valued at £55. There were two claimants to the machine—Mr. Robert Hatcher, Bank Buildings, Barking Road, E., and Mr. Joseph Barker, 71, Church Road, Bethnal Green, E. A month or so ago Barker was arrested on a warrant, charged with stealing the motor-cycle the subject of these proceedings, and it was then stated by Hatcher that there had been negotiations between him and Barker for the building of a new motor-cycle for £58. On that arrangement £8 was paid on account, and it was agreed between them that £25 should be paid on the 1st of the month following delivery, and £25 on the 1st of the next month. Barker several times hired an old motor, and one Saturday went away with it and did not return, his arrest following. Barker's defence was that the machine he was charged with stealing was the one he had engaged to buy; that he had paid £8 deposit, and was to pay the balance (£25) in September, and £25 next month. The Bench dismissed the charge of theft against Barker, expressing their opinion that it was quite possible the parties had misunderstood each other. The machine at that time was in the possession of Detective-inspector Nicholls, and in the absence of any order to give it up he had retained it. A number of witnesses were called and long arguments followed. In the result the Bench made an order on the police to deliver up the motor to Barker, but advised him not to deal with it till (1) six months had passed, (2) pending the decision of the suit for malicious prosecution which he had instituted, and (3) till the balance of the £58 was paid.

POLICE TRAP.

At Little Wolford, on the road from Oxford to Stratford-on-Avon, is a trap worked by policemen in plain clothes.

RESTIVE HORSE v MOTOR-CAR.

At Bristol County Court, before Judge Austin, Edwin Baker, of Nailsea, and Mrs. Baker brought an action against Frederick Butt, of Victoria Street, Bristol, to recover £21 damages by reason of the alleged negligence of defendant in driving a motor-cycle at Nailsea on July 9th last.

Mr. W. A. Roberts, on behalf of the plaintiffs, stated that on the day named plaintiff, with his wife and two children, were driving in a cart at a moderate pace, through Silver Street, Nailsea, and met the defendant upon a motor-cycle. When about twenty-five yards divided the parties the horse was startled, became restive, and turned round. Instead of pulling up the motor, the defendant tried to pass, and in doing so a wheel of the motor locked with a wheel of the vehicle of the plaintiffs. The cart was upset and the occupants were thrown out. Mrs. Baker was injured somewhat considerably, Mr. Baker was also hurt, but happily the children escaped. The horse was cut about the knees and hocks, and the cart and harness were damaged. The contention on the part of the plaintiffs was that when defendant saw that the horse became restive he should have pulled up, and not have tried to rush past the horse. After hearing evidence, the judge said that the motors were entitled to the same rights on roads as other vehicles. The mere fact that the thing made a noise and frightened a horse was not evidence of negligence. When Mr. Butt saw the horse was restive, he shut off power and went quietly on. In his opinion, there was not sufficient evidence to show that Mr. Butt did not do what a reasonably careful man would do, and he gave judgment for the defendant, with costs.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

VOL. V.]

LONDON, SATURDAY, OCTOBER 17, 1903.

[No. 241.

Published Weekly by CURDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE imports of foreign automobiles into this country show a slight tapering off. The number of cars and cycles imported last month was 461, the value of the same being returned at £141,335. The value of the "parts thereof" is given as £18,944, so that we get a combined total for September of £160,279 as compared with £196,364 in August last, and £297,881 (representing 294 cars)

in September, 1902. Some of the imports were of only a temporary character, being re-shipped to foreign destinations. Thus last month the re-shipments comprised 36 vehicles, amounting in value to £11,531, bringing down the net imports in September to £148,748. For the first nine months of the year, the net import of motor-cars, cycles, and parts stands at no less than £1,551,074 (representing roundly 5,110 vehicles), practically double those during the same period of 1902. As regards the exports of automobiles of home manufacture, the shipments during the past month were the largest so far recorded, amounting to 121 vehicles, of a value of £39,158. Of parts the exports attained a value of £4,708, making a combined total for September of £33,866, as compared with £12,782 (representing 31 vehicles) in September, 1902. To the end of September 623 vehicles of British manufacture had been exported this year, these, together with the "parts," representing a sum of £234,968.

Motorists as Loafers.

THE Rev. W. D. H. Armstrong has a queer idea of the loafer, who, according to the dictionary, is a person who lounges or loafs about. This reverend gentleman is a member of the Yeovil Rural District Council, which has already made itself conspicuous in the anti-motoring crusade, and at its last meeting he described motorists as "rich loafers," while a colleague improved upon the compliment by describing those who drove cars as "asses" and "lunatics." Fortunately motorists are not the only people who bray, and the Yeovil District Council is not the arbiter of the destinies of the automobile world.

The Hozier Works.

THE extension of the new works of the Hozier Engineering Co. at Bridgeton, Glasgow, was opened on Friday last. Lord Provost Sir John Ure Primrose proposed the prosperity of the company at the inaugural lunch, pointing out that our commercial supremacy depended on the enterprise and readiness with which we assimilated every idea which tended to the perfection of our industrial methods. Mr. W. A. Smith, the chairman of the concern, responded, and Mr. C. Scott Dickson, K.C., M.P., proposed the health of the Lord Provost.

For Municipal Work.

THE Midland Municipal Officers' Association held their first monthly meeting of the winter session at the Great Western Hotel, Birmingham, this week, under the presidency of Mr. A. D. Greatorex (West Bromwich). A paper was read by Mr. Joseph E. Parr (assistant surveyor to the Handsworth Urban District Council) on "Motor Vehicles for Municipal Work." The paper was mainly devoted to a comparison between horse and motor haulage. Experiments are being made by a number of local authorities in the way of street watering, dust collection, and in fire brigade work. In Kensington the steam water-cart was able to do work equal to three one-horse vehicles. Mr. Parr also sees great possibilities for the municipal motor-vehicle, which may at short notice be readily fitted with a plough and used for snow removal. Motor-vehicles, Mr. Parr considers, are more economical, where they are kept continually at work with the minimum of time devoted to collecting and loading, while they cause much less wear and tear of roads than the hoofs of horses.

Motor-Cars and the Police.

ON several occasions we have given instances of the value of the automobile in connection with police work, and we now learn that Mr. Garner, a Nantwich motor agent, has just been of some assistance to the police of his district, in tracking a horse stealer. He took the local police superintendent and two police officers on his Rex car, and the thief was fortunately caught about six miles out from the town on the same day. Perhaps the police authorities will in the near future regard the automobile as an essential part of their station equipment. Meanwhile, we are glad to see they are not above receiving the assistance of motorists when engaged in their duties.

A Scottish Run.

THIS year the Scottish Automobile Club, of which the Marquis of Ailsa has just accepted the vice-presidency, will hold an anniversary run in commemoration of the passing of the Light Locomotives on the Highways Act. This is to be held to-day (Saturday), the destination being the town of Ayr. The cars will meet in Blytheswood Square, Glasgow, at 10.30 in the morning, and the Club Committee is inviting all Scottish automobilists, whether members of the Club or not, to participate in the run, which, if fairly decent weather prevails, will be a great success. Motorists intending to take part in the event should communicate as early as possible with the honorary secretary, Mr. R. J. Smith, 59, St. Vincent Street, Glasgow.

Maidenhead Bridge.

MR. JOSEPH TAYLOR journeyed to Maidenhead Town Hall, last week, accompanied by a party of friends, including Mr. J. Fulbrook, of Slough, whose motor-car cushion was seized three and a half years ago, when he refused to pay the toll, eightpence (admitted at the Charity Commissioners' Inquiry).

this year to be illegal). It was sold for three shillings, and he received threepence change by registered letter post. Therefore, he occupied the position of chairman at the meeting as the primary cause which led Mr. Taylor to take up the Battle of the Bridge. The meeting was conspicuous by the absence of any member of the Maidenhead Corporation, who might have been supposed to be interested in a subject of such importance to the ratepayers. Mr. Taylor said there was no Act of Parliament to be got with regard to Maidenhead Bridge; the Corporation had one, and took care not to let him see it, but he discovered the Act in the British Museum. Then, after writing letters to the Corporation, he went to Messrs. Witt, K.C., and Danckwerts, K.C., through whose ability he freed Windsor Bridge in the final appeal to the House of Lords, and obtained their opinion, which was favourable to him. Next the Maidenhead Corporation had to submit their books to the Charity Commissioners, and it was discovered that they had spent nothing on the bridge, but £30, in ten years; they had put the receipts to borough purposes. The public would be satisfied by the ceasing of the tolls on the 31st October, and he (the speaker) could then retire and meet the costs and expense he had been put to the last three years.

A Pioneer Motorist.

MR. H. HEWETSON, who has been connected with automobilism since its inauguration in this country, is resigning his position as managing director of Hewetsons, Limited. He was a prominent figure at all the early motor runs, his Benz car carrying him to Brighton on several historic occasions. In the accompanying photograph he is seen on the first motor-car

Mr. H. Hewetson on the first Benz Car imported into England.

introduced into England in 1894. Later he achieved distinction by making fifty journeys of 100 miles day by day until an aggregate of 5,000 had been reached, and in his retirement from the position he has held so long will carry the good wishes of his many friends.

Motor-car Post.

THE automobile is becoming recognised by local postal officials, and a great boon has been conferred on Swaledale (Yorkshire) by the postal authorities. Hitherto mail carts have worked the district. Now a service of motor-cars will shortly be established for the conveyance of mails and passengers to Reeth and the upper reaches of Swaledale. Experimental journeys have been made by Mr. Morton, the Richmond postmaster, with most satisfactory results.

The First Scottish Motorist.

IN connection with to-day's run of the S.A.C., it may be of interest to recall that Mr. T. R. B. Elliot was the first user of a motor-car north of the Tweed. It was on December 27th, 1895, that he commenced running a 3½-h.p. iron-tyred Panhard car when he lived with his father at Clifton Park, Kelso. He ran 1,200 miles before the passing of the Act in November, 1896 and had the distinction of being fined 6d. at Berwick-on-Tweed for not being preceded on his way by a man with a red flag.

Breezes and Bonnets.

THE sudden striking one in the face by a large sheet of metal when going at seventy miles an hour is a possibility not to be anticipated with any degree of serenity, and the accident to Mr. Du Cros, jun., from this cause might have had an unpleasant result. In fact, more serious consequences were avoided by the coolness of the *mecanicien* catching hold of the steering wheel and so guiding the car, for Mr. Du Cros was stunned by the blow. Such a chance of mishap is not unknown to racing men, and a simple preventive is to fasten a leather strap right round the bonnet and underneath the frame. All owners of four-cylinder cars might adopt this simple device, and thus guard against similar contretemps.

A Civic Excursion.

SEVERAL of the Town Councillors of Southampton had a motor-car excursion the other day for the purpose of determining the speed limit of cars within the borough, which will be enforced under the new Motor-Car Act, which comes into force on January 1st next. All the different approaches to the town were traversed, and subsequently the "City Fathers" were the guests of several prominent motorists at tea.

Capt. Deasy descending the Rochers de Naye along the Cog Railway to Caux on his Martini Car. (See page 631).

Where Limitations of Speed are Asked For.

NOT only in Hampshire — which county was the first to move in the matter — but throughout the country local authorities are moving in anticipation of the Act. Some parish councils have already decided on recommending that all the roads within their areas should be scheduled for inclusion in the 10-mile-per-hour limit. Other enterprising village councils have discussed the matter as though the maximum should be reduced to six miles. Next week we shall publish the names of some places where decisions to ask the Local Government Board to schedule the roads within the area of the local bodies have already been come to. Readers are

invited to acquaint us of similar decisions being come to in their localities, so that we may be able to show exactly where the feeling against motorists is showing itself most strongly.

Motor Mountaineering.

THE adventure of Captain Deasy at Caux, referred to last week, arose out of a sporting bet recently made between the Captain and the vice-president of the Automobile Club of Switzerland. Since then he has made another ascent from the Palace Hotel at Caux to the terminus of the mountain railway line of the Rochers de Naye, 3,200 feet higher and 6,640 feet above sea level.

A Specimen "Accident."

How motor-cars are credited with wickedness of which they are not guilty was illustrated the other day in the columns of a leading Liverpool contemporary, which published a circumstantial account of how a motor-car had struck a trap, flinging the occupant to the ground with such force that medical assistance had to be obtained. Fortunately for automobilism, Mr. A. H. Dudley was cycling in the locality where the alleged motor-car accident happened, and has sent to

Motor-Car Wedding.

THE time has come when people no longer marvel at the temerity of the bride who goes to church on a motor-car. The automobile is also playing an important part in honeymoon tours, and it is evident that the matrimonial motor-car has come to stay— or rather to go. The accompanying photograph was taken at Hunstanton, on Thursday of last week, the occasion being the marriage of Miss Johnson, daughter of the head of the firm of W. H. Johnson and Sons, motor engineers, of King's Lynn and Hunstanton. In the group are to be seen five of the eight automobiles which were employed in conveying guests to and from the church.

Roads in Kent.

MR. D. JOSCELYNE, late chief engineer to the Public Works Department of Bengal, after an inquiry extending over a period of eleven months, has, in pursuance of instructions given him by the Kent County Council, made a report upon the system of repairing and maintaining the main roads in that county. Kent stands alone amongst all the counties of England in adopting the contract system, and Mr. Joscelyne condemns it as expensive and inefficient. He points to the depot

A Motor-Car Wedding Party at Hunstanton.

the Press a less ornate but more accurate account of the incident as follows:—

The True Account.

"My brother and myself were returning from Mollington on cycles, and near where the road branches off for Saughall we met a runaway horse, all alone. This afterwards proved to be the animal belonging to Mr. Walley's conveyance, which we found a short distance on this side of the gibbet windmill, lying on the grass at the road-side, completely overturned, and with Mr. Walley lying unconscious underneath. We managed to ease the weight somewhat, but this proved a rather difficult matter. A few minutes later a motor-car containing three gentlemen (strangers to us) came along from the direction of Neston, and together we released the injured man. The owner of the car then very generously offered to turn back and take Mr. Walley to Neston for medical assistance, and this was the course adopted. I think it extremely improbable that any motor-car caused the accident, as not one passed us whilst we were on the Old Chester Road. It certainly could not have been the one whose occupants so willingly rendered the valuable assistance they did. Apparently it was owing to the left-hand wheel crossing the ditch and mounting the hedge bank that the vehicle was so completely overturned."

system of collecting materials for the repair of the highways. This involves handling and hauling (frequently for unnecessary distances) twice over. Traction engines are largely employed in the haulage, and are responsible for the excessive wear and tear of the roads. Often the haulage of stone by traction engines goes far to destroy as much material in the road surface as is being hauled for repairs. Mr. Joscelyne is of opinion that road-rolling should be carried out all the year round, and not during the winter season alone; while the rollers should belong to the authority, and not be hired from contractors. Counties which work departmentally own and use only from four to eight rollers each, but in Kent, the number of rollers simultaneously and daily used varies from forty-two to fifty-eight.

Road Comparisons.

SUMMING up his case against the contract system of road maintenance, Mr. Joscelyne states that the average net cost of roads in the county of Kent is £17.6 per mile more than the net cost of Glamorganshire, £24.6 per mile more than that of Essex, £41.1 per mile more than that of Surrey, and £61.0 per mile more than that of Cheshire. In gross cost per mile, in net cost per mile, and in cost of material per mile, Kent stands higher than any other county from which returns have been obtained. Kent uses more stone per mile than any of the other

B

counties, and more than twice as much as ten out of fifteen of the counties. Mr. Joscelyne considers that at a moderate estimate the loss to the county by the contract system, with its accompaniments of defective management and feeble and inefficient control, has amounted to £200,000 or £300,000 in the course of twelve or thirteen years. Mr. Joscelyne's recommendations entail a complete revolution of the present methods of road maintenance and repair and business management. He strongly advises the council to abolish the contract system altogether, to adopt the departmental system of road management, and declares that it is absolutely necessary that the council should have an engineer-surveyor who can devote his whole time to the duties of his office.

The Speed of Tram Cars.

AT Brentford, Sidney Blackler, James Dowse, and Ernest Downham, drivers in the employment of the London United Electric Tramways Company, have been summoned for driving their cars at speeds exceeding 10 miles an hour—18, 15 and 16 miles an hour respectively—the first two at Uxbridge-road, Southall, and the other at Richmond-road, Twickenham. The police measured off lengths of the road and timed the cars with stop-watches. In the case of Downham evidence was called, and one passenger put the pace at "three to six miles an hour," and another at "certainly not above 10 miles an hour." The defendant deposed that his topmost speed position at the time was seven miles an hour. Mr. Montagu Sharpe asked what the maximum speed of the cars was. Mr. Oswald Hanson (for the company), said they ran up to 10 miles an hour limit. The reply evoked a burst of laughter from Mr. Sharpe and his nine brother magistrates, and Mr. Sharpe, having questioned the defendant, said the car weighed ten tons, was on the down grade, and was overtaking a trotting van. He imposed a fine of 20s., including costs, in each case. Mr. Hanson said the men had to pay their own fines. The case of Mr. Moffat Ford against drivers in the service of the London United Electric Tramway Company has been further adjourned to the 31st inst.

Scottish Traders.

AT a meeting of the Scottish Motor Manufacturers and Traders' Association in the North British Station Hotel, Edinburgh, on the 8th inst., the following gentlemen were elected members: Messrs. R. Douglas Croall (John Croall and Sons, Ltd.), W. E. Townsend (Middleton and Townsend) and William Flint. Great satisfaction was expressed with the membership, which now includes nearly every motor manufacturer and trader in Scotland. The question of a form of guarantee which would be acceptable to the trade generally was considered, and it was remitted to the Chairman and Secretary to draft a form and submit it to the next meeting.

The Vagaries of the Bench.

THE vagaries of the judicial mind are frequently illustrated in our list of furious driving cases, as reported week by week. Often motorists are fined £5 or £10 for driving their cars at a speed only a mile or so per hour faster than will be permissible when the new Act comes into force. Offences of greater degree, which, in this matter, means greater speed, incur less penalties at other courts. This week's list presents another instance of the inconsistency that prevails throughout the country. At Liverpool a motorist was summoned for driving a car to the danger of the public and knocking a man down. With grave mien and in solemn tones the chairman of the Bench declared "it was a very serious thing to knock down a man with a motor-car, and the bench must mark their sense of the defendant's error of judgment by imposing a fine of 5s. and 4s. 6d. costs." On the same day, at Doncaster, a motor-car driver, who was alleged to have driven at thirty miles per hour, although he only confessed to fifteen, was, in consideration of the fact that he "had not been previously convicted, fined a mitigated penalty of £7." Verily it would appear to be cheaper to knock a man

down in Liverpool, than to travel speedily on the roads of Doncaster. Possibly the good people of the latter town fancy they see in the motor-car a rival to the horse—an important factor in the prosperity of the place.

Rules of the Road.

THERE is no doubt the prevailing idea in the minds of the public is that motorists are a selfish lot of individuals, and so long as they can progress they care not what becomes of other users of the road. They seem to think the one idea of drivers of automobiles is to proceed as expeditiously as possible, and to pass other vehicles at all hazards. This idea is strengthened by a letter from a motoring correspondent, who complains that small cars will not give way to faster cars. He maintains the former will hold the centre of the road, and thus prevent all passing except by taking risks. He thinks all forms of slower traffic should make way to the faster, and this opinion, in the main, we agree with. We are afraid human nature is the same among all classes, and we can further endorse the continuation of the same correspondent's remarks as to the unreasonableness of some competitors in the 1,000 miles Trial, whom he maintains proceeded daily in lines and singles, nearly always hugging the wrong side of the road, and steadfastly obstructing the efforts of other motorists in their attempts to pass. *Argumentum ad hominem.*

Tiller Steering.—A Point for Study.

AN American medico-motorist, Dr. B. Franklin Stahl, has written to a contemporary on the subject of tiller steering, pointing out the possibility of the development of a permanent injury resulting from a form of lameness in the third finger of the left hand. The doctor writes as a result of a personal experience, and attributes the lameness to the tiller steering mechanism of his car. The condition developed soon after the beginning of the use of this form of steering device, and has, he states, proved quite resistant to remedial measures. The doctor continues:—"It seems reasonable to regard it as due to injury inflicted by the end of the tiller engaging in the palm of the hand incident to certain movements in guiding the machine. The condition induced could easily be mistaken for a rheumatic affection of the second joint of the ring finger. There are doubtless many others who have had the same trouble, and, judging from my own experience, are likely to have it for an indefinite time. It is very desirable that the subject should be carefully studied, and, if the facts warrant a conclusion against this form of steering device, that the matter should be brought to the notice of the manufacturers."

Mr. Dugald Clerk.

MR. DUGALD CLERK, who is to read a paper at the Automobile Club on "The Governing of Gas and Petrol Engines" on Thursday next, is a well-known authority on the gas engine. In 1878 he designed some improvements in these engines, and in the following year they were exhibited at the Kilburn Show of the Royal Agricultural Society. Later he invented the "Clerk" two-cycle gas engine, and has since attained reputation in connection with papers read before many learned societies.

THERE will be no anniversary run from London this year organised by the Automobile Club of Great Britain and Ireland.

The Local Government Board is reported to have decided that for the purpose of specifying the 16ft. highway referred to in Clause 8 of the Motor-Car Bill, the measurement will be made over the entire space between the fences or hedgerows forming the boundaries on the two sides.

THE new Toledo long-distance steam touring car has now arrived in London, and the agents (Messrs. Shippey Bros) will be pleased to drive intending purchasers over any of the roads which were included in the itinerary of the recent Reliability Trials.

ECHOES OF SOUTHPORT.

A PART from the natural irritation caused by the excessive charges of the local innkeepers, the meeting at Southport was of a most enjoyable character and perhaps the most successful race meeting yet held. Competitors and officials worked most harmoniously together. There was one defect, however, and that was that occasionally there was considerable doubt as to which events were being proceeded with, but this is a detail which can easily be rectified in subsequent gatherings of the kind. The track was a good one, with one rather sharp corner, which was usually taken by the inside man in a way that caused spectators sometimes to hold their breath.

The earlier process of weighing the cars was necessarily a slow one, but somewhat exciting, notwithstanding the pouring rain. The amusement was found in watching the faces of the competitors as they saw their cars going on the scales, in more than one instance having to take them off again for further stripping. In one case especially this seemed impossible, but finally, after jumping heavily on the scales and removing the screwdriver, Mr. Roll's Mors was shown to weigh exactly two thousand kilos. The Star car weighed 19 cwt. 2 qrs. 14 lbs.; Mr. Lloyd's Napier, driven by Pugh, 18 cwt. 3 qrs. 7 lbs.; and Mr. Edge's Napier, 19 cwt. 2 qrs. 10 lbs. The Daracq had to remove its accumulators to get under the weight

Mr. Williamson came along almost immediately after on his new 16-h.p. Lanchester, a car with which he is exceedingly pleased. A short run on this vehicle round the town convinced us that it is worthy of the high reputation of the firm, and we may say its speed surprised us. As in all Lanchester cars, it is air cooled, quiet in action and free from vibration. The garage consists of a range of buildings with fully equipped workshops, electrically installed, and a large engine room with a 30-h.p. gas engine and one of smaller power for reserve, dynamos, etc., large switchboards, and the other usual paraphernalia. The whole of this engine room is looked after by the neat Phyllis who opened the door to us, and who, while working, is able to keep herself as tidy as any housemaid. Truly these Southport people are wonderful, and when our friend suggested a run round his private motor-car track attached to the house, this was accepted as a matter of course, and the ride much enjoyed. An up-to-date sight was to see the many stalled stables occupied, not by horses, but by petrol cans, outer covers, inner tubes, etc.

Hospitality and Southport seemed synonymous terms, and the invitation to visit Mr. Thornycroft Vernon's garage and house was equally welcome. Here we found an 18-h.p. Mercedes, a 24-h.p. Georges Richard, a 20-h.p. M.M.C., and several other cars. A number of local friends, as well as others from Liverpool and elsewhere, were also assembled. This garage is on a similarly elaborate scale to that already mentioned, with the

Mr. Andrew Fletcher, of Saltoun, on his 60-h.p. Mercedes.

[Photos by]

Mr. J. E. Hutton on his 70-h.p. Panhard and Mr. J. Lisle on the Star Racer.

[Mr. V. A. Simon.

THE SOUTHPORT TRIALS.

allowed, while the Wolseley, with rather an elaborate body, had to come off the scales for further "fining." The C.G.V. proved to be within the limits, while the car ridden by Mr. Henri Farman in the Gordon Bennett Race, and now driven by Mr. Harvey du Cros, jun., was 28 lbs. under the permitted weight.

To we Southerners, cramped in London, and having to pay twenty shillings a week for a cage on a top floor to keep our car in, the sight of some of our friends' garages filled our hearts with envy. Mr. Baxter, of the Leyland Rubber Company—makers of the Collier tyres—lives at Leyland in a district with plenty of available land; therefore we were not surprised at his elaborate electric installation and convenient garage, where he and his son keep their cars. *En passant*, we might mention that in place of the sixteen horses previously kept, only two specimens of the equine race remain, these being favourite pensioners.

Even outside the town of Southport itself the fame of Mr. Williamson's garage is well known, and an invitation to visit our old acquaintance of the first thousand miles trial days was eagerly accepted. Driving past the hall we made straight for the garage, the door of the engine room being opened by a neat girl in apron, who bade us enter. Mr. Higginbotham and his friends were at work on the former's 60-h.p. Mercedes, while Mr. Williamson's 20-h.p. Mercedes was being overhauled, and our 40-h.p. Mercedes seemed pleased to be in such good company. We noticed in addition a 20-h.p. Daimler, an old steamer and a 10-h.p. Lanchester.

additional luxury of carpet. The establishment leads straight from the billiard room, and Mr. Vernon, not content with the spacious accommodation already provided, has works in progress to provide rooms, etc., for the men, and to cover the courtyard, so there will be no fear of friends' cars being left in the wet. As at Mr. Williamson's, the electric light is used wherever possible, and the whole arrangements are on a very comfortable and pleasant scale. Viewing these garages, as we have already stated, has set our hearts longing, and shortly there may be seen in our pages an advertisement for a modern garage in the country, with a cottage attached, wherein to sleep. For it seems the custom for ladies and gentlemen to spend their spare time overhauling and examining motor-cars.

Southport, from a motoring point of view, is evidently a very go-ahead place, with a popular mayor, Mr. T. Scarisbrick, whose first words on introduction to Mr. Roger Wallace were not in praise of the Motor Car Act, and who is famous outside his town for his penchant for motor-cars. His wife also drives an electric vehicle, occasionally carrying two other lady passengers, one of whom sits *a la mecanicien*. Whether, however, the recent trials will be made an annual event or not appears somewhat an open matter. A powerful committee of local, Liverpool and London men has been formed as a preliminary, but we understand the elaborate and perfect arrangements made will cause an increase in the rates of one penny in the pound, and notwithstanding the

enormous sum of money brought into the town, it is reported that there is already some grumbling at the expenses.

While returning to town, what might have been a nasty accident happened. Mr. Williamson, on his 16-h.p. Lanchester, escorted Mr. Higginbotham on his 60-h.p. Mercedes, and Mr. Cordingley on his 40-h.p. Mercedes, as far as Ormskirk. About three miles further on, in turning a corner, the "sixty" suddenly swerved, smashed the gate and one of the posts to pieces, and by some means turned with its nose straight into a ditch. The back passenger, Mr. Ward, went over the driver's head; the second passenger, Mr. Crewe, fell sideways into the same ditch, and Mr. Higginbotham, somehow, fell on to the gear box. The back of the seat was splintered. Our car, close behind, had, fortunately, just room to clear, and pulling up quickly, we hastened back, where we found everybody up, and apparently not much hurt. The ditch, unfortunately, was wet, and those who had been in were damp, but no bones apparently were broken. On examination it was seen that the frame of the car had deeply embedded itself into the earth, all amongst a lot of roots, and well under a hedge. Espying a colliery some distance away, our car was sent to obtain boards, tackle, etc. These were soon obtained, and quickly in use. Two hours' strenuous exertions were necessary, however, to get the car on to the road. It was then seen that beyond the steering no vital damage had been done. A piece of copper wire was utilised to fasten this up, and cautious progress made to St. Helens, where leather bands were purchased, enabling all to reach Macclesfield just before ten o'clock.

LICENSING CERTIFICATES.

SINCE the new automobile law came into operation in the State of Massachusetts no motorist ventures therein, unless provided with the certificates of which we give reproductions herewith. One refers to the vehicle itself, the

Commonwealth of Massachusetts

Massachusetts Highway Commission

20 FEMBERTON SQUARE, BOSTON

MASSACHUSETTS AUTOMOBILE REGISTER No. 394

This certifies that an automobile owned by or under the control of Henry G. Fack, residing at No. 367 Union Street, Springfield, Mass., has this day been registered in accordance with the provisions of chapter 473 of the Acts of 1903.

DESCRIPTION OF MACHINE.

Type of machine, Runabout, Name of maker, J. Stevens Arms & Tool Co.; Maker's number, 110, Character of motor power, Gasoline; Horse power, 8 1/2; Predominating color, Black. The register number, which will be furnished by the Massachusetts Highway Commission, shall be displayed at the front and back of the vehicle in conspicuous places so as to be always plainly visible. The automobile shall carry two lamps showing white lights visible at least two hundred feet in the direction toward which the vehicle is proceeding. The register number shall be displayed on the sides or fronts of said lamps, in such a manner as to be plainly visible when the lamps are lighted. The figures are to be in Arabic numerals not less than one (1) inch in height.

Date August 4, 1903. W. E. T. Clough, Jr. Massachusetts Highway Commission. Countersigned: Arthur Secretary. Not valid unless countersigned.

Commonwealth of Massachusetts

Massachusetts Highway Commission

20 FEMBERTON SQUARE, BOSTON

MASSACHUSETTS AUTOMOBILE REGISTER. OPERATOR'S LICENSE No. 238

This Certifies that Harry G. Fack, residing at No. 367 Union Street, Springfield, Mass., has this day been licensed to operate an automobile of motor cycle in accordance with the provisions of chapter 473 of the Acts of 1903.

Description of Person Licensed.

Date of birth, May 5, 1873; Sex, Male; Height, 5 ft. 9 1/2 inches; Weight, 150 lbs.; Color of hair, Brown; Color of eyes, Brown. Date July 29, 1903. W. E. T. Clough, Jr. Massachusetts Highway Commission. Countersigned: Arthur Secretary. Not valid unless countersigned.

other to the driver, and neither leave any doubt as to the identity of the car or its driver. If this is the class of licence to be introduced into this country motorists are scarcely to be congratulated.

SOME USEFUL NOTES.

AN improved terminal for ignition connections has been brought out by Messrs. Herz and Co., of New York. The terminal consists of two parts, one telescoping in the other. The inner one of these two parts is fastened to the cable end by means of a screw. The insulation of the cable is first cut away for about three-quarters of an inch, and the strands of the bare end are bent back over the insulation. The copper shell or inner part of the terminal is then slipped over the end of the cable

and is secured by means of the screw. The cap will be seen to be provided with a circumferential ridge or corrugation about the middle of its length. The outer part of the terminal is made to exactly fit over the inner part, and is slotted and provided with a perforated lug for connection with the sparking plug. The outer part of the connector remains constantly fixed to the plug, it being only necessary to pull the cable end out of this connector when it is desired to disconnect the plug.

IN one of their weekly letters on tyres and the proper treatment of the same, which appear in nearly all the French automobile papers, Messrs. Michelin refer to the effect of moisture on tyres, and admit that it weakens the fabric in all cases when it makes iron rust. Where bolts, that penetrate the fabric, rust, deterioration of the latter is sure to spread, and for this reason it is common that tyre casings burst the first time they are used after a winter's rest, the effects of rust and moisture having become localised and aggravated during the storage period. The question as to whether muddy tyres should be washed or not is thus answered:—"By all means wash them after each trip; there is less danger of damage from the water, which soon dries off, than from the mud, which retains the moisture; besides, the mud may conceal a cut which ought to be attended to."

WE frequently receive enquiries as to the cause of explosions in the silencer or exhaust box. Their origin is very simple. Whenever a charge in the cylinder fails to be ignited owing to "missing" or other causes, the unburnt charge passes out of the exhaust valve upon its being opened by the cam and enters the silencer. If only one or two charges are missed the proportion of fresh gas in the silencer may be small in comparison with the burned gas which it contains from previous explosions, especially if the silencer be a large one. If, on the other hand, a large number of explosions are successively missed, the burnt gas may be entirely "scoured" out and its place taken by a perfect mixture of full explosive qualities. Everyone has noticed the blue flame which passes the exhaust port when the exhaust pipe is disconnected, and upon an explosion in the cylinder with the silencer attached, this flame rushes into the exhaust pipe and silencer. When, therefore, after missing a large number of explosions, the engine finally succeeds in securing an ignition, the exhaust flame reaches the silencer full of perfectly explosive gas, which promptly fires. Fortunately the silencer contents are only at atmospheric pressure and so the pressure of explosion cannot much exceed 100 pounds per square inch, but this is, remarks Mr. A. L. Clough, an American expert, sufficient to wreck a weakly constructed shell. Every silencer ought to be designed to withstand 100 pounds per square inch internal pressure and a due factor of safety then allowed.

THE Eastbourne Town Council has informed the British Electric Traction Company that as a system of motor omnibuses has been inaugurated, there is no necessity for electric trams, and that if they should be required the Corporation would provide its own system.

CONTINENTAL NOTES.

THE question of the course for the 1904 Gordon Bennett race has not yet been settled. In addition to the one in the Homburg district, a course between Lippstadt and Paderborn has been suggested, and the other day General Becker and Freiherr von Brandenstein, of the German Automobile Club, went over it by motor-car. Still another route, and one which is said to have many points in its favour, is in Mecklenburg. A good deal of talk is at present going on in motoring circles in Paris as to the French team, and at the meeting of the Committee of the A.C.F. last week it was definitely decided to send a challenge to the German Club. It is reported that several French firms have notified their intention of building special racers for the event, among these being Renault, Darracq, and Gobron-Brillie. The Sporting Committee of the A.C.F. had the matter under consideration last week, and decided that, as an acknowledgment of the success of the Panhard-Leva-sor Company in securing and holding the Cup for two years, one of the places in the team of three shall be allotted to a Panhard. For the other two places an eliminatory trial is to be held.

It looks as if the 1904 Gordon Bennett race will be the most important of the series, for, judging from present appear-

At Butgenbach, Germany.

At Bastogne, Belgium.

BY ROAD FROM PARIS TO ST. PETERSBURG.

ances, there will be no less than eighteen cars on the road. Challenges have been received by the German Club from France, Great Britain, and Austria. America will doubtless send in a challenge, while it is not improbable that Belgium will enter the field, for it is now announced that the Compagnie Metallurgique, of Marchienne, is building two special 100-h.p. racers for the event, that the Pipe Co. are building a racer, and that the Nagant Co., of Liege, which is about to turn out cars on the Rochet-Schneider system under licence intends to follow the example.

THE Automobile Club de Namur and Luxembourg is interesting itself in the question of tarred roads, with the view of obviating dust, and has decided to experimentally tar a kilometre of the Namur-Dinant road near Wepion.

"LA FRANCE AUTOMOBILE" has issued the rules and regulations under which the touring competition from Paris to Rome will be run off in March next. There will be four classes, all touring vehicles, based on the cylinder capacity of the engine—Class 1, 0-2 litres; Class 2, 2-4½ litres; Class 3, 4½-7 litres; and Class 4, more than 7 litres. Full particulars of the competition may be obtained by anyone interested from M. Paul Meyan, 68, Avenue de la Grande Armee, Paris. Entries will be received up to March 1st, the fee being 100 fr. for Class 1, and 200 fr. for Classes 2, 3 and 4.

THE kilometre trials on the Dourdan road are to be held on Thursday next, and promise to afford an interesting meeting. They are being organised by "Le Monde Sportif," and already over fifty entries have been received, among these being Mr. S. F. Edge, with his Napier car.

OWNERS of 22-h.p. English Daimler cars likely to undertake a tour in France will learn with satisfaction that a car of this type has been formally passed by the Service des Mines as fulfilling all the requirements laid down by the French Government. Owners of cars of this type will consequently be relieved of all trouble when taking their vehicles into France, the Daimler Company being able to furnish the necessary *permis de circulation*, to allow the car to be taken into France without difficulty on this score, the motorist consequently having only to secure a *permis de conduire*.

FOR some time automobilists in Brussels have rebelled against the decree issued in July last by the burgomaster, M. de Mot, limiting the speed of motor-cars through the streets of the city to five kilometres an hour. Some test cases came before the courts last week, and resulted in a victory for the motorists, the judge declaring the decree of the burgomaster to be illegal, because the municipal council could not delegate to the burgomaster the right to draw up a regulation which that body alone

could make. Consequently the motorists were acquitted. The judgment has caused great rejoicing in automobile circles in the Belgian capital.

THE track race meeting which is to be held on Sunday next at Westend, Berlin, by the German Automobile Club promises to be an exciting event. The entries so far received include M. Jenatzy, who will drive a 60-h.p. Mercedes; Herr Robl; with a 40-h.p. Durkopp; Herr W. Poge, 60-h.p. Mercedes; Herr J. Beut'er, 45-h.p. De Dietrich; Count Schonborn, 28-h.p. Mercedes; Dr. Ludwig Kohnstamm, 28-h.p. Mercedes; Count Felix Chamare, 24-h.p. Nesselldorf; Herr Martin Hewald, 24-h.p. De Dietrich; Dr. Alfred Sternberg, 20-h.p. Protos; Count Talleyrand-Perigord, 16-h.p. Cudell; Dr. James Bleichröder, 24-h.p. Panhard; Freiherr von Nutzenbecher, 12-h.p. Benz; and Freiherr von Brandenstein, 12-h.p. Cudell.

AT a meeting of the Technical Committee of the A.C.F. last week a discussion took place as to the possible utilisation of steam in the cylinders of internal-combustion engines, and it was announced that some experiments in this direction were being carried out at the Club's laboratory.

THE latest news to hand of Madame Lockert, who it will be remembered is making the journey by road from Paris to St.

Petersburg on a 14-h.p. Tony-Huber car, is from Wilkowichky, in Poland. The intrepid chauffeur was delayed at the frontier for some time by the officials, who would not allow the car on Russian territory, on the ground that her passport only permitted entry by rail and not by road.

M. SANTOS-DUMONT returned to Paris on Sunday last from the visit to his native country. He proposes to ascend in one of his airships as soon as the weather is fine enough, and he also talks of trying to cross the Channel. The aeronaut will next year return to Brazil for the purpose of competing for the prize of £20,000. This prize is offered to aeronauts of all nations, the competitors having to steer their airships round the Bay of Rio de Janeiro.

TOURING IN WALES.

HAVING just completed over 1,000 miles on my new 10 h.p. Wo'seley car, which was specially built with extra long tonneau, and filled with luggage, only leaving room for the two passengers behind, I send you a photo of same, taken whilst climbing Great Orme's Head. We started from Long Acre, London, ran into Lincolnshire, and across to North Wales, where we paid a visit to most of the interesting places,

Mr. G. Linnell climbing Great Orme's Head on his Wo'seley Car.

afterwards returning via Birmingham to London. With the exception of one puncture caused by a large nail when near Llangollen, which delayed us ten minutes, we had no trouble whatever. Furthermore, we have so far only used about two pints of water, the engine keeping remarkably cool. We were eight days on the tour, on one of which we gave the car a rest, owing to heavy rain. The stop, however, afforded us time to look round the old city of Chester.

GEORGE LINNELL.

A MONTH WITH A MOTOR-BICYCLE,

BY THE REV. R. OAKLEY.

STARTING from High Wycombe on August 25th, I commenced my long ride, steering to Oxford, climbing Dashwood Hill *en route* with my motor-cycle loaded. Thence I travelled to Gloucester and on to the precipitous town of Chepstow, the main street of which is a very stiff gradient, being 1 in 6 in places, my trusty Quadrant, however, climbing this in style. From there I continued on over the many miles of country tram lines, through Newport, Cardiff, Cowbridge, Bridgend, Neath, and Swansea, to Carmarthen, making this last mentioned place in twenty-four hours from the start, the distance being 205 miles—not a bad first day's travelling. I was delayed by rain at Carmarthen, but arrived at Tenby just at dark, 236 miles, without breaking the journey.

On the next day I went to Llandilo, thence to Malvern *via* Llandovery, Brecon, climbing the Hertfordshire Beacon at 25 m.p.h.; on to Worcester, Kidderminster, Much Wenlock and Shrewsbury to Chester; making a non-stop run from Kelsal *via* Warrington, Wigan, and Preston to Lancaster. Then there was a glorious run through the Lake District to Grasmere, whence I left at 12.30 for Keswick and Carlisle, and arrived at Selkirk at 7.45 p.m., the best non-stop run so far of the tour. From Selkirk I went to Edinburgh, to officiate at a wedding. Then I started southwards to baptize a child at Twickenham.

The route this time was *via* Moffat and the Beattock Valley, the machine going well in spite of my having ridden full tilt into a ford in the dark. Luckily, neither myself nor the machine sustained any damage. I came over the top of the Kirkstone Pass, where I stopped at the highest hotel in the United Kingdom, viz., 2,854 feet above sea level, the landlord informing me that mine was the first motor-bicycle he had seen there.

Swirled by hurricanes and dodging the showers, I fought south to Cheshire again. A fine sunset enticed me to ride all night, and as I was due at Twickenham next day, I decided to start, having turned over my first thousand miles that day.

I reached Twickenham safely, but had set myself too long a run, and, when tired, charged a wall in the dark, carrying away the left pedal and lamp on port side; this was refitted locally, and I was off again to Tintagel, Cornwall, next day, *via* Reading, Andover and Salisbury.

I appreciated the advance of the 1903 "Quadrant" engine when I faced the awful hills between Andover and Salisbury. Got to Wincanton, where I picked up a horse-shoe nail, mended tyre and proceeded to Exeter, continuing *via* Oakhampton and Launceston to Tintagel; making this place my headquarters for a few days and taking local runs to Boscastle, Truro, Stratton, etc., and during the last 250 miles I did not touch a nut or screw.

I returned *via* Crediton, Tiverton and Wellington to Taunton, then moved south to Dorchester and Southampton. Here I found the inner tube of back tyre about done for, having carried me over 3,000 miles, and (considering the load) this was not a matter of surprise or complaint. My last day's run home on 26th September was 206 miles, *i.e.*, Southampton to Chichester, reaching there at 11.30 a.m., then to Brighton and London, reaching High Wycombe once again at 10.15 p.m., the machine climbing the Amersham Hill to my very door. During the tour I made four separate days' runs of over 200 miles each, the longest being from Grasmere to Watford, a distance of 264 miles. The total length of the trip was 2,172 miles. Weight of machine, 133 lbs.; weight of luggage, accessories, etc., 94 lbs.; weight of rider 13 st. 10 lbs.—192 lbs.; making in all a total weight of 419 lbs.

DR. GORDON STABLES cannot lay claim to originality in the determination he expresses in his weekly letter to the press, to fire at the tyres of motorists rushing at full speed past his caravan. Should he, however, carry his threat into execution, the victim will probably know how to deal with anyone guilty of such conduct.

THE USE OF OIL IN ROAD IMPROVEMENT.

(Continued from page 622.)

BY JAMES W. ABBOTT.

THERE has been a very spirited controversy over the question, "Must oil be artificially heated to produce the best results?" Until within the past year the majority of the practical oiled road makers insisted that it must; but experience with oil at normal temperature (always spoken of as "cold oil") has resulted in increasing the number of those who advocate doing away with heating devices. It is universally conceded that the hotter the oil can be applied the more quickly it becomes absorbed and incorporated with the road material. Heat thins the oil and in-

rolled with a light roller. The purpose of this is to insure uniform consistency and a firm foundation. It should then be left undisturbed, if possible, until the water dries out. Many roads have been oiled and excellent results obtained without any wetting or rolling, but the practice described is the best where the facilities are obtainable.

A soil which after being wet tends under travel to pack firmly, but is still sufficiently porous to let water drain through, is ideal for treatment with oil. A clay that bakes and then pulverises into fine dust under the wheels will only give good results when some material is added, as explained later. After the road surface has become dry it is well, if feasible, to run a sharp-toothed harrow over it, so as to loosen it to a depth of three inches. The aim is to secure an oil crust three inches thick. If the road surface can be made to absorb oil to that depth, that is the simplest way to get the crust. If this surface

A MILITARY MOTOR-CAR IN BAVARIA.

In the recent military manoeuvres in Bavaria a number of motor-cars were used for the first time. The illustration shows a party of officers, including Prince Arnulf of Bavaria (seated to the right of the tonneau) leaving the Steingaden Castle of Count Durckheim for the scene of operations.

(Allgemeine Automobil Zeitung.)

creases its tendency to penetrate a firm road covering. The principal argument against heating is its cost. It requires special apparatus, and the process involves some expense. If the heating apparatus is stationary, the oil must go to it to be heated and hauled from it on to the road treated, no matter how far away. The tendency in oiled-road practice is, however, towards relying for heat upon the sun only.

When a road is to be treated it must first be prepared to receive the oil. It should receive a crown of about a half inch to the foot; on a sixteen-foot roadway this would leave each side four inches lower than the centre. Careful attention should be given to the drainage, so that water can quickly run off and not soak into the foundation of the road from the sides. The oil covering when finally made will be impervious to water, but if the foundation is water soaked it loses its firmness and ability to support the road surface under travel, and causes it to break through in spots. After the road has been properly shaped it should be given a thorough soaking with a road sprinkler and

is hard and will not readily yield to the harrow for a depth of three inches, the practice is to build it up by adding material after the oil is applied.

The next process is the putting on of the oil. If travel can be kept entirely off the road, then the full width should be finished before vehicles are allowed on it. If that is impossible, then a strip at a time must be treated, and travel meanwhile confined to the other strip.

The oil is put on by means of a longitudinal tank mounted on wheels like an ordinary sprinkling wagon. Four horses can readily pull one holding from 800 to 1,000 gallons. To the rear of this tank is attached the device which lets the oil out on to the road. Attempts have been made to use an ordinary sprinkling wagon, but with very poor success, as it has been found impossible to get any regulation in the discharge. When the tank was full it would discharge much faster than when it was partly full. There was a tendency also for the centre of the strip treated to get too much oil and the edges not enough. If

hot oil was used, the spray tended to cool it before it reached the ground.

In what is known as the De Camp machine the distributor proper is mounted on separate wheels and coupled to the rear of the tank wagon, the slip tongue being removed. The oil runs from the tank through a flexible hose. It has an oil reservoir and three sets of fingers. The first set makes furrows just ahead of the oil-discharging pipes. The second set of fingers (or curved teeth) covers up the oil, and the third set stirs up the combination of oil and dirt. There is also a drag to crush any globules or chunks which may tend to form. When the oil is being distributed, the second and third sets of fingers and the drag are raised from the ground by hooks. After the oil is distributed, this machine is detached from the tank, the slip tongue put in, and the machine dragged backwards and forwards over the oiled road until the oil has been thoroughly incorporated with the road material.

In other distributors, the oil is conducted from the tank by a forked tube into a large bore pipe about six feet long, so attached to the framework of the wagon that it hangs cross-wise of it and about six inches above the ground, just behind the rear wheels. The pipe has a number of openings on its under side through which oil can run out. These openings are uniform distances apart, in sets, and all controlled by valves which can be opened either by the driver or by a man who has a seat for the purpose on the rear of the tank. The various levers, cranks, connections, and fittings in all the machines are such as experience has suggested, and the machines have been evolved by degrees. By having the openings in sets, any width strip can be oiled which is a multiple of eighteen inches. Whatever form of distributor is used, the driver starts his team on a walk, the valves are opened, and the oil, running through openings so close together, reaches the ground in a sheet practically unbroken for the width treated. The aim is to regulate the flow so as to spread all the oil the ground will absorb.

The next process is to stir up the newly-oiled surface, and work the oil and road material together. How this is done with the De Camp machine has already been described. Other ways are as follows:—A sharp-toothed harrow, preferably the ordinary steel-lever kind, with the teeth slanted back, is dragged along and then across the road until further stirring is unnecessary. In Golden Gate Park men follow the distributor with rakes and stir the matter entirely by hand. Special machines called "stirrers," to be drawn by horses, are made, in which the teeth have an oscillating or cross motion when the machine is being pulled forward. Another machine, which is said to be especially valuable when the ground is cold or wet, is the Fitzgerald roller, provided with alternating rows of inch-square steel prongs six inches long.

If after the stirring process some spots appear sticky and others dusty, it shows too much or not enough oil has been used. Over the sticky places should be thrown some of the unoled road material and this stirred in with a hand rake. The dusty spots must be treated with more oil and stirred. The whole work should show uniform results. After twenty-four or forty-eight hours the road can be travelled over.

The practice above described is that followed when the material is sufficiently porous for oil to readily mix with it. If it is hard, like baked clay or macadam, and cannot be readily stirred, the practice is very different. For such conditions the oil must be put on when the road surface has been heated as much as possible by the sun. If the oil itself can be first heated, so much the better. In fact, the more heat there is in the oil, the ground, and the atmosphere when oil is applied, the quicker the results obtained, whatever process is used. Some of the oil will sink into the hard covering; the rest will remain upon the surface and must receive a coating of sand or fine gravel. The oiled crust which results from such treatment will be partially the top surface of the original road and partially the new envelope. This can still be further built up by another oiling and another layer of sand. This sand (or fine gravel or quite sandy loam) can be applied with a shovel by a man who rides on a load of sand

driven beside the oiled strip. Practice will bring considerable dexterity in throwing out sand in thin strips with a shovel.

(To be concluded.)

THE "SANDRINGHAM" COMBINED OMNIBUS AND WAGONETTE.

THE accompanying illustration depicts a 10-h.p. combined omnibus and wagonette which has lately been completed by Mr. Frank Morriss, of King's Lynn. The chassis is of the standard design, fitted with 10-h.p. balanced double-cylinder "Sandringham" motor. The lubrication of the latter is effected on a special system, whereby the oil is forced from a reservoir to a distributor on the dash by means of a mechanically-operated pump. Attention has also been devoted to the question of silence of the motor and vibration whilst standing. The engine is fitted with Mr. Morriss' system of governing, whereby the motor can be cut down whilst passing horses, or whilst the car is standing, to almost absolute silence. The governor is adapted to act on the exhaust valves of the engine. Instead of the usual fixed cams, the camshafts in the "Sandringham" motor are fitted with loose longitudinal sliding eccentric cams, which, when actuated by the governor, control the motor by varying the lift of the exhaust valves, and regulating the speed and power of the motor to exactly what is required by the user at any particular moment. The gearing is of the usual Panhard sliding-sleeve design.

giving four forward speeds and reverse. All journals in the gear-box are fitted with large wearing surfaces, and in every instance provided with self-lubricating boxes. Further, all end thrusts (including that of the clutch) are taken by ball bearings of suitable dimensions. The car has a neat external appearance, the body being painted a dark chocolate with yellow lines, and the wheels and under part yellow with black lines. Fixed on the car is an omnibus top, with railway carriage windows; this can readily be detached, converting it immediately into a wagonette. In front of the bus top is fixed a seat for three persons, and lower down there is a spare seat by the side of the driver, while another six persons may be comfortably quartered inside the car. Between the driver's seat and the body of the car is a specially-designed basket for carrying guns, etc. The car, which Mr. Morriss claims to be not only highly efficient but absolutely fool-proof, has been built for Mr. J. H. Richards, of the Castle Hotel, Downham, Norfolk, who is using it for ordinary hotel work and for conveying shooting parties. In the trials to which the vehicle was submitted three days after delivery, the efficiency of the transmission was well illustrated by the carrying of a load of thirteen passengers, in addition to the heavy omnibus top, a distance of 100 miles at an average speed of over sixteen miles per hour.

THE HAGEN PETROL MOTOR WAGON.

THE Hagen system of motor traction, which is being introduced into this country by Messrs. Alf. Dougill and Company, Limited, of Leeds, comprises an entirely novel arrangement of transmission gear, for which the makers not only claim great efficiency but that it combines most of the advantages

strongly to withstand heavy shocks. The fore springs are double elliptic and the axle works in horn plates. The hind axle has the usual single long elliptic springs. The artillery wood wheels are of 3 ft. 3 in. diameter at the front and 4 ft. at the rear, thus giving easy running over rough roads. The steering is controlled by a horizontal hand wheel, acting through a pinion and spur quadrant on to an Ackerman axle.

Fig. 1.—Sectional Elevation of Hagen Petrol Motor Wagon.

of steam traction with those that can be claimed for the petrol and paraffin motor. At present lorries and vans are being made in 2, 3, 5, and 7-ton capacity sizes, and, as soon as new works are completed, vehicles suitable for public service work will be constructed.

The lorry illustrated herewith in Figs. 1 and 2 is capable of carrying two to three tons and hauling a trailer. Its chief characteristics are strength, ease of running, flexibility of speed

The engine is of the horizontal type, and develops 7-b.h.p. at the slow speed of 450 revolutions per minute; it is easily accessible for examination and adjustments. The cylinder is 5½ in. diameter by 5½ in. stroke. The main frame is a steel casting, carrying the crank bearings and valve gear; to this bed is fitted a loose sheet iron cover with inspection hole. The cylinder, which is cast in one with the water jacket, is attached to the frame by four

Fig. 2.—General View of the Hagen Petrol Motor Tank Wagon.

at constant power of engine, and the absence of vibration from the motor.

The main frame is constructed of channel steel stiffened with wood and steel plates. The single cylinder motor is bolted to the fore part of the framing, and, as the whole space occupied by the machinery is also used for seating room and tanks, the maximum amount of platform space is available for goods, the 2-3 ton lorry having an area of 58½ sq. ft. The axles are built

studs which are placed outside the jacket and also hold the cylinder cover and valves. The inlet valve is located directly over the exhaust valve and is worked automatically by the suction of the piston. No ports are formed by this method, the two valves being directly inside the combustion chamber. The exhaust valve is opened by a horizontal rocking lever actuated by a cranked lever and tension rod. The ignition is magneto electric; the magneto spindle works

directly on the ignition plug and is timed from the driving seat. The inlet valve is enclosed in a dome, the pipe to which conveys the mixture from the carburettor. The latter is of an extremely simple type. The spirit is fed by gravity from the tank, which is situated under the seat. The water circulation is maintained by a centrifugal pump driven by a belt from the crank shaft, the water passing from the cylinder to a radiator under the foot board. The water cooling is said to be so efficient that although only six gallons of water are carried, under half a gallon is consumed in ten hours' working. The fly wheel is massively built to reduce any vibration and give steady running, and in it is built the governor. The throttle is kept open by means of a taper "runner" which works against the flywheel. According to the position of this runner the throttle valve is closed or opened, the opening varying at the intermediate positions. The silencing of the exhaust is effected by a very large exhaust box consisting of concentric mufflers and a small egress for the escaping gases.

The transmission gear is entirely different from any present system, and is described briefly as follows:—The valve gear of the engine, which runs inside an oil bath, is built sufficiently strong to transmit the whole of the engine power. At the end of the valve shaft is a crank disc (2) to which is fitted a connecting rod (1), actuating a swinging lever (4) with a fixed stroke. This swinging lever is placed parallel to and alongside another swinging lever (6), pivoted in the centre and having rods (7 and 8) connected to the top and bottom of it. The motion is imparted to this second double-ended lever by a connecting block capable of sliding up and down, and according to its position the stroke of this second lever, and consequently the speed of the car, is varied between zero and maximum. This motion of the lever is transmitted to the hind axle by the two connecting rods (7 and 8) and the reciprocating motion is here converted to a rotary one by means of two ratchet clutches. The latter are strongly built, there being seven teeth in each, and as the ratchet tongues work in slides, radiating from the centre, the whole is free from wear or liability to jam. Along with this gear box (17) on the hind axle is a reversing motion, giving also a free position to the transmission. By this it will be seen that the actual transmission is free from gear wheels, chains, or belts, and at all times the engine is working at maximum power. All wearing parts are fitted with lubricators, and when travelling there is only one point to watch, i.e., the hand wheel controlling the speed. The wheel is at the driver's left hand, and when turned as far forward as possible in one direction the car is at rest, although the engine is running and all in gear; by turning the wheel gently backwards, the lorry starts slowly and easily, and the more the wheel is turned the faster the vehicle will travel until the maximum, twelve miles an hour, is reached.

Another special point to which attention may be drawn is that if, when going up hill, it is desired to stop, no brakes need be applied; by simply putting the transmission to zero the hind wheels are locked and no backward movement can take place.

A powerful brake acting on a band 6 in. wide, outside the differential, is operated by a pedal, while a hand lever operates tyre brakes on the hind wheels.

The whole vehicle is so designed that it can be handled by one man, and the motor, being easily started, can be stopped when necessary, to save fuel. If only a short stop is required, the engine can be left running at as slow a speed as 100 revolutions per minute. All the working parts are protected from wet, and the transmission gear is entirely out of the way, so that the vehicle can cross fords and muddy places without trouble.

With the immense fulcrum power that is obtained through the medium of the lever transmission, the makers claim that the vehicle will carry a load of three tons, on a give and take road, on a consumption of half a pint of petrol per h.p. per hour.

LORD WOLVERTON has been convicted at Perth of having driven a motor-car past a young horse when requested to stop. A fine of £5 was imposed.

LOCATION OF TROUBLES.

IT is an old maxim among petrol engine men that when the motor stops or refuses to work, the first thing to look after is the spark, or the ignition mechanism. A majority of all explosion engine failures are due to faults in the ignition, and of the rest most are due to defects in the gas-making apparatus, the carburettor. In nearly every case when an engine stops, it either does not get "mixture" or there is not a sufficiently hot spark in the combustion chamber, or no spark at all.

At present owners frequently find great trouble in locating a fault when their engine stops for an unknown reason, chiefly because there are no means of directly and absolutely verifying whether the motor is getting "gas" and whether a spark is produced in the cylinder. The occurrence of a spark can, of course, be ascertained with reasonable certainty by holding the sparking plug connection at some distance from the spark plug and turning the engine over by hand. But whether the engine is getting mixture cannot be made absolutely sure without removing connections.

In a case which came under our notice recently, remarks the "Horseless Age," the driver first tested the spark, but found it all right; then he opened a valve on the carburettor, from which some petrol flowed, which satisfied him that there was nothing at fault with the petrol supply, and he once more turned his attention to the sparking system. After about half an hour's fruitless effort to locate the trouble he sent for an expert, who discovered in a few minutes that the petrol tank was empty! Of course, there was still a little spirit in the bottom of the carburettor, but, being considerably below the normal level, there was not sufficient to form a charge of explosive mixture, and the engine stopped.

In experimental engines mica windows are sometimes placed directly over the sparking plug points, through which the spark in the cylinder can be directly observed. There appears to be no reason why such windows could not be regularly fitted to engines over the sparking plug, and also on the inlet pipe just outside the inlet valve. If spark and mixture could be directly observed many a tedious search for a fault might be saved.

WHILE at Southport we had the pleasure of a run on the new Siddeley light car, and found it to travel quietly and smoothly. Its finish and style is quite elegant.

MR. F. J. GLYNN has been elected secretary of the Motor Cycle Union of Ireland in succession to Mr. J. C. Percy, who has resigned owing to pressure of business.

FOLLOWING the example of the German Automobile Club, the Frankfurt Club held a 150 kilometre reliability run in the Lorschach Valley on Sunday last.

THE racer driven by M. Louis Renault in the Paris-Madrid race, and which secured the first place in the run to Bordeaux, has been acquired by M. Dannat, the well-known painter.

WHILE the King was journeying to Kempton Park on Saturday, his motor-car stopped on Stamford Bridge, Fulham. A delay of quite a quarter of an hour was caused ere the car was got going again.

THE Wolseley Tool and Motor Car Company, Limited, have just finished a 12-h.p. convertible wagonette and omnibus for the Czar of Russia. The wheels have, we understand, been shod with 3 in. Buffer tyres by the Sirdar Rubber Company, Limited.

A NEW system of lubrication for the bearings of axles has been introduced by the Lubricating Company. In the cap a small hole is provided into which fits a smaller cap which can be pressed down on a spring, thus allowing the lubricant to reach the desired parts. In this way the lubrication can be quickly and thoroughly effected, all danger of dust and dirt reaching the parts being entirely obviated.

HERE AND THERE.

THE Archbishop of Canterbury has been motoring with the Marquis of Londonderry.

MR. A. H. LEE, M.P., the new Civil Lord of the Admiralty, is a captain in the Motor Volunteer Corps.

FOLLOWING on the achievements of the 10-h.p. Duryea car in the Phoenix Park races in July last, the Duryea Company are naturally very proud of the success of their vehicle in the Southport trials. We give herewith an illustration of

the 10-h.p. car which succeeded in carrying off the cup in the class for touring cars costing between £200 and £400. The car covered the kilometre in 1 min. 7 1-5 sec., equal to a speed of over 33 miles per hour.

AT Portsmouth, last week, a motor-cyclist was fined 25s. 6d. for being drunk whilst in charge of a motor-bicycle.

MESSRS. HORSFALL AND BICKHAM, of Pendleton, Manchester, are now appointing agents for their Horbick car for next season's sales.

GOOD accommodation for motor-cars has been provided by Messrs. V. Andrews and Company, at the Red Lion Hotel, High Street, Dorking.

MESSRS. J. E. WHITTLE AND COMPANY, 41, Kingston Road, Portsmouth, are keeping a stock of petrol, oils and grease for motor-cycles and cars.

THE Glossop Town Council is making application to the Local Government Board for regulations prohibiting a speed exceeding ten miles an hour in the borough.

THE A.C.F., at the request of several manufacturers, has postponed the start of the Motor-cab and Delivery Van Competition from the 12th inst. to the 19th inst.

THERE is some talk of building a direct road for motor-cars between Ostend and Blankenberghe. At present the journey between the two places has to be made *via* Bruges.

PRINCE and PRINCESS ANDREW OF GREECE, after their marriage at Darmstadt last week, drove to Heiligenberg Castle, in the Grand Duchy of Hesse, by motor-car. The Prince drove, and the Princess Alice sat beside him. A mechanic accompanied the Royal couple.

M. FORESTIER, chairman of the Technical Committee of the French Automobile Club, has promised to read a paper at the A.C.G.B.I. on December 3rd, on the subject of "The Liquid Combustibles employed in Automobile Motors, their Mixture with Air and their Explosion."

THE American Daimler Motor Company has lately completed a 30-h.p. public service vehicle for use in Ecuador. The vehicle, which has seating capacity for eleven persons, is on Mercedes lines. A noticeable feature of the car is the wheel base, which is no less than twelve feet in length.

MESSRS. MANN AND OVERTONS inform us that their 12-h.p. Georges Richard car, No. 57 in the Reliability Trials held last month, has now been adjudged by the judges to have made seven non-stop runs instead of six, as first announced, and one stop of less than five minutes.

THE Aston Motor Accessories Co. has been registered with a capital of £2,000 to adopt an agreement with Messrs. B. G. Hodgson and H. C. Barlow for the acquisition of the business of manufacturers and dealers in motor-cars, motor-cycles, and accessories, now carried on by them at Aston Lower Grounds, Birmingham, as the A. V. Motor Accessories Co.

WHILE an employee at Messrs. Smith's motor-car and cycle works, Soho Road, Handsworth, was testing a new motor-bicycle an electric spark ignited some petrol which was escaping from the tank of the machine. The workpeople managed to keep the upper hand of the flames till the arrival of the Handsworth Fire Brigade, when the fire was speedily extinguished.

THE fact that Mr. Howard Swan's "Travellers' Colloquial French; a Handbook for English Speaking Travellers and Students" has run into seven editions is sufficient proof of its utility. The new edition has been enlarged and thoroughly revised, and, in addition to idiomatic French phrases, contains much general information of use to English and American visitors to France and Belgium. The feature of Mr. Swan's work is that against each phrase is given the phonetic pronunciation, so enabling those unacquainted with the French language to make themselves understood. To render the book of service to motorists, and to bring it thoroughly up-to-date, four pages of "phrases for automobilists" have been added, these dealing with matters likely to crop up at a garage. We may add that the book is published by Mr. David Nutt, of Long Acre, W.C.

WITH the object of reducing the liability of side-slip or of eliminating it altogether, and at the same time increasing the comfort of riding, Mr. A. P. Broomell, of the firm of Messrs. Broomell, Schmidt, and Steacy, of York, Pa., U.S.A., has recently designed the novel vehicle shown in the accompanying illustration. As will be seen, the car is fitted with six wheels, the front and rear pairs of which are connected and move together in steering, while the middle wheels are the drivers. The central or driving axle forms a support for two sets of long semi-elliptic

A Six-wheel Motor-car.

springs, the outer ends of which are held by the front and rear axles. In other words, these springs, which support the body on equalising lugs, form the frame of the car, assuring, states the "Automobile," great flexibility and consequent easy riding. The wheelbase is 96 inches, the tread 62 inches, and the over-all length of the car 10 feet 8 inches. The car is driven by a 20-h.p. double opposed-cylinder motor, mounted in front within the vehicle body, and readily accessible after lifting the protecting hinged door forward. The transmission is of the planetary type, on the lines of that in the Oldsmobile, a central chain driving on to the differential mounted on the middle or driving axle.

THE members of the Farnham Urban District Council and the Haslemere Parish Council, having considered the proposal to petition the London and South-Western Railway Company to provide a motor-omnibus service between the two towns similar to that recently inaugurated by the Great Western Railway between Helston and the Lizard, have decided that the matter should be left to the discretion of the railway authorities. The route between Haslemere and Farnham would serve Shotter Mill, Hindhead, Grayshott, Churt, and Frensham.

The Eastbourne Municipal Motor Omnibus. (See last issue.)

(G. and R. Davis.

THE habit of the average boy of hanging on to the backs of vehicles of every description is a very common one. The other day William Thom, an Edinburgh lad, was hanging on to the back of a motor-car which was going along London Road. He stepped off in front of a cable car, and before the driver could even notice that he was knocked down. His right foot became jammed in the guard, and the car dragged him along several yards. Thom was taken to the Royal Infirmary, where it was found that the ankle was very severely injured.

ONE motor-car and one motor-cycle were imported into Grangemouth from Christiania during August.

DURING the coming session the Engineering Society, in connection with the Birmingham University, will pay a visit to the works of the Lanchester Engine Company, Limited.

FROM the Whitney Manufacturing Company, of Hartford, Conn, U.S.A., comes a bundle of literature relating to the Whitney motor-car chains, which are largely used in America. The Whitney Company is endeavouring to institute a series of chain standards for the trade, and for the 1904 season proposes the following four sizes of roller chains :—

Pitch.	Dia. of roller.	Width of roller.
1 in.	$\frac{5}{8}$ in.	$\frac{1}{2}$ in.
$1\frac{1}{4}$ in.	$\frac{3}{4}$ in.	$\frac{3}{4}$ in.
$1\frac{1}{2}$ in.	$\frac{7}{8}$ in.	$\frac{7}{8}$ in.
2 in.	1 in.	1 in.

MR. D. M. WEIGEL was stopped on Sunday by Sergeant Jarrett on the Guildford road. The sergeant told the motorist he was going too fast, which Mr. Weigel at once admitted. On the sergeant enquiring why, he replied that it was ridiculous to ask anybody to do twelve miles per hour, and if the sergeant were a motorist he would comprehend it. Sergeant Jarrett replied he had noticed that Mr. Weigel was always a very careful driver through towns and villages, wished him a pleasant good evening and told him he would not hear any more about it. Naturally, Mr. Weigel is of the opinion that Sergeant Jarrett is a much-abused person.

ROADS in the Windsor and Egham districts are to be treated with Westrumite.

ON Thursday next, the 22nd inst., the Leicester Automobile Club will hold a run to Market Bosworth, Hinckley and Earl Shilton.

ELSEWHERE we give the new regulations of the Marine Department of the Board of Trade with regard to the coastwise carriage of petrol.

MR. J. D. HILL has retired from Messrs. John D. Hill and Company, and in future the business will be known as The Consolidated Automobile Company. It will be carried on under the management of Mr. Allan C. Instone.

STRANGE as it may seem, Gabriel, who drove the Mors racer in the Gordon Bennett race, has only just received his *permis de conduire* for a motor car. For over four years he has been driving high-powered cars with only a *permis* for a motor-tricycle, but has never been stopped by the police.

THE performance of the Hon. C. S. Rolls in covering the flying kilometre on a 110-h.p. Mors motor-car at Welbeck on Monday in 26 2-5 secs., or 84.68 miles an hour, is stated to be a world's record. The record speed of eighty-six miles an hour attributed to Baron de Forest over the kilometre during the Irish motor-car fortnight was incorrect, the Baron's actual time being 26 3-5 secs., or only 84.04 miles an hour.

FOLLOWING the example of the Winton Company, the White Steam Car Company have started the publication of a monthly bulletin, a copy of the first number of which has been sent us. Naturally it is devoted to the doings of the White steam car, and in addition to details of the factory, gives brief accounts of tours that have been successfully carried out on these vehicles by private motorists during the past summer, and also of the various races in which the White has figured. The bulletin is neatly got up, and contains a number of interesting illustrations.

WE have all experienced difficulty in keeping out rain when we are meeting it at a considerable pace, say a trifle over the legal limit, and it has been found by experience that waterproof garments must have no opening forward admitting wet. Mr. T. H. Holding, who has invented many garments of an effective kind for motoring purposes, has now brought out the "Car-Poncho" illustrated in the accompanying sketch. Whilst there is an opening admitting the head, it is so skilfully devised that it will not admit rain, no matter how hard

it drives. But there is a more important provision in the garment, viz., an elastically constructed neat fitting collar rising well above the ordinary white collar, which has an interior of soft absorbent felt of very thin texture, so that it is difficult for wet to run down the neck. The collar can thus be kept clean. He has also invented for the same garment a plan of preventing the pressure on the wrist while closing it in. It is ingenious and effective, and will last. The "Car-Poncho" is being manufactured in many materials.

MOTOR-CYCLING NEWS.

A VERY interesting reliability trial was carried out by the Motor Cycle Union of Ireland on Saturday last. The trial was in the nature of an inter-team contest between the Ulster and Dublin centres of the Union, and took place between Belfast and Dublin, the distance being about two miles short of one hundred. The entry was unrestricted, but the best three performers of each of the teams counted, and the team having the best aggregate score won. As the contest started from Belfast, the Northern centre had the strongest numerical representation, starting twelve men to Dublin's five. The performances on the whole were excellent, eleven of the seventeen starters getting through. The regulations laid down a minimum speed of fifteen miles per hour and a maximum speed of twenty miles, and those who kept within these limits were awarded full marks, provided they made no involuntary stoppages on the journey. All of the finishers were within the speed limit and the marks lost were for stoppages, five marks being deducted for each stop. Two men made non-stop runs, six only one stop each and of the remainder only one stopped more than twice. The placings, times, and marks lost were as follows:—

	Hrs.	mins.	secs.	
R. W. Ireton (Riley)	...	4	59	50 ... lost no marks.
C. B. Franklin (F.N.)	...	4	59	50 ... " five marks.
T. Ireland (Humber)	...	5	3	30 ... " "
A. Summers (Triumph)	...	5	10	50 ... " "
J. Stewart (Centaur)	...	5	16	20 ... " "
T. E. Denby (Excelsior)	...	5	17	30 ... " "
P. S. Brady (Centaur)	...	5	18	50 ... " "
T. Mallon (Quadrant)	...	5	18	50 ... " three marks.
H. A. Evans & T. W. Murphy (Singer Tandem Tri.)	...	5	28	10 ... " ten marks.
J. Holden (Meteor Rover)	...	5	30	15 ... " "
F. McKee (Werner)	...	5	18	50 ... " fifteen marks.

Also competed, C. G. Grey, H. S. Huel, W. J. Forsythe, H. Strain, A. J. Thompson, and Bell.

The placings in the team contest were as under:—

Ulster centre, lost eight marks, first; Ireton, none; Mallon, lost three; Ireland, lost five.

Dublin Centre, lost fifteen marks, second; Franklin, none; Summers, lost five marks; Evans and Murphy, lost ten marks.

Mr. A. Williamson and Mr. H. J. Shinn acted as time-keepers at Belfast, and Mr. F. J. J. Glynn at Dublin.

WE regret to hear that owing to so few members being willing to participate it has been found necessary to abandon the Motor Cycle Tour from Land's End to John o' Groat's which was proposed by the Cyclists' Touring Club.

ON Saturday last, on the Palmer Park cycle track, Reading, under the auspices of the local automobile club, Messrs. Starley and Co., Coventry, gave a demonstration of their motor-bicycle fitted with worm drive and two-speed gear. There was a large assembly of interested spectators, including the following, who also tried their machines on the track:—Messrs. E. P. Collier, J.P. (2½-h.p. "Bat"), J. V. Moinet (2½-h.p. "Bradbury"), Dr. Foster (2-h.p. "F. N."), A. E. Newton, Hon. Sec. (2½-h.p. "De Dion" tricycle) A. Phillips (1½-h.p. "Royal Enfield"), Dr. C. Truman (2-h.p. "Clement Garrard"), F. Gale (2½-h.p. "Gaelic"), Pennell (2½-h.p. "Excelsior"), Pennell, jun. (2½-h.p. "Riley").

AT the Handsworth Police Court, Dr. George Adamson, of 150, Birchfield Road, Handsworth, was fined for keeping a carriage without a license. David Newlands, Inland Revenue officer, stated that on July 23 he saw defendant and a lady on a motor-tricycle. When spoken to about not having taken out a license, defendant admitted that he had had the machine three months. Defendant added that he was testing the tricycle for the Rex Motor Manufacturing Co., Coventry, to whom it belonged. Defendant told the magistrates the machine was his own invention, and he had no intention of evading the license.

A HILL-CLIMBING contest under sealed handicap was held on Friday, the 9th inst., in connection with the Herefordshire Automobile Club, on the Hereford side of Dinmore Hill, which is 1½

miles long, with an average gradient of 1 in 12. It was open only to the motor-cycling members of the club. The time was taken from a flying start and the timing was done by Messrs. Margrett (start) and Townsend (finish). No pedalling was allowed, and observers were posted to take the number of any competitor who broke this rule. Owing to the unsettled weather only ten competitors attempted the climb. All managed to do it without pedalling, though it was thought doubtful if all would negotiate the nasty corner half-way up without slackening, especially as the road was greasy. The following were the results:—

Competitor.	Machine.	Engine and h.p.	Time.
Hall...	Quadrant	Quadrant 3	2 46
Marriott	Marriott	De Dion 2½	2 52
Ekins	Minton	Minerva 2	2 57
Groom	Excelsior	M.M.C. 2½	2 58
Simpson	Triumph	Minerva 2	3 6
Godwin	Coventry Eagle	— 3½	3 19
Langford	Rex	Rex 3	3 28
Passey	Victor	Minerva 2	3 41
Weale	Ariel	Minerva 2	3 53
Chave	Excelsior	M.M.C. 2½	3 59

MR. A. B. LITTLEWOOD, of Nottingham, records how, when on his holidays—in Norfolk—this summer, he had the honour of driving for a considerable distance on his motor fore-

Ready to Start.

carriage tricycle a lady who will be 103 at the end of the year—probably the oldest inhabitant of these islands who has ever enjoyed an automobile run.

A NEW V-section belt for motor-cycles, made on their "Balata" principle, has just been introduced by Messrs. R. and J. Dick. It is claimed that the belt is not affected in any way by atmospheric variations or wet, and that it does not stretch.

THE result of the Motor Cycling Club's 100 miles non-stop test for two seated motor-cycles with two or three wheels, held on the 12th ult., has just been made known. It will be remembered that out of ten starters five completed the run. Mr. A. C. Wright, on Ormonde tandem, and Mr. A. W. Hacking, on Ormonde and side-carriage, divide the main award, both these riders having completed the distance without a stop, and within the limit of the speed provided by the rules. Messrs. Lord, Johns and Hooydonk will also receive medals, each having completed the distance as a non-stop, but slightly in excess of the limit of speed, the maximum pace allowed by the rules being 17 miles per hour.

THE New York Motor-Cycle Club has, by general consent, instituted a system of small fines for lapses on the part of members participating in club runs. Failure to start to time means a penalty of 10 cents, running away from the party entails a fine of the same amount, and not stopping when a halt is ordered, 5 cents. The funds thus accumulated are to be used in helping to provide refreshments at the club's bi-weekly "talks," during the winter season.

CORRESPONDENCE.

FITTING A RADIATOR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I shall be glad to have the opinion of any of your readers as to the practicability of attaching a radiator to my 3½-h.p. International Benz car. At present the cylinder is cooled by water from a tank at the side of car and under the back seat; this holds a little over two gallons and is evaporated after about ten or fifteen miles, and I thought if a radiator could be placed in the front it would be much more effective than the present system.—Yours truly,

NOVOCASTRIAN.

ACCUMULATOR QUERIES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Can any of your readers tell me if there is any way of preventing motor batteries from discharging themselves suddenly? Some weeks ago I was about to make a tour and had my batteries newly charged, each pair showing 4.4 volts. The night before starting I tested them again, and, although it had not been used at all, one was absolutely empty. It was afterwards sent to the makers, who said it could not be repaired and that it had been badly treated. I have no idea how a battery can be badly treated, as it had not been knocked about in any way.

Last week the other pair went in exactly a similar way. They had run about 200 miles since charging, on September 8th, stopped suddenly

A NEW USE FOR OLD TYRE COVERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With regard to the Comment in your last issue entitled "A New Use for Old Tyre Covers," I think I have a better way of saving money and covers—at least my way has proved a success so far, after driving now over three years and done 20,000 miles on different makes of cars, such as Panhards, Daimlers, Napiers, and Mercedes. My method is as follows:—After a cover has been worn down to such an extent as to render it unsafe for further use on the wheels as regards punctures and gashes by sharp flints, I replace it with a new cover, and when gashes or big cuts make their appearance in the tread of the new cover, I take the old one and cut it into sections from about five inches to nine inches in length, according to the bad place on the cover already in use. I then take one of these sections and cut away about two inches off each side (where the rim holds it), and then bevel the edges down all round so that it fits comfortably inside the cover without pinching the inner tube. In the case of a large cut, the first thing I do is to let out all air, slip off the cover opposite the cut, pull out the inner tube for about two feet, then put in the section of old cover, making sure it goes well home on the opposite rim. The inner tube is then replaced and slightly inflated, and the cover carefully replaced on the rim with the tyre lever. This piece of old cover will keep out water and dirt better than any inside cover patch I have yet seen and used. Not only so, but a good speed can be kept up, and at least 200 miles can be done on it without further fear of the hole getting larger. I claim that a whole old outer cover can be put in in this way, without showing it when the car is at a standstill; the weight is not very much increased, and the engine will "pull" almost as well with as without it. The method has also the advan-

Photo by]

The Reliability Trials. The scene in Cecil Square, Margate.

[Mr. C. Frinell.

on the road, and on testing them next morning were quite empty. Neither of the batteries have been in use a year, and the car has only run 3,000 miles.—Yours truly,

H. J. B.

THE MOTOR-CAR ACT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In my copy (1895) of Stone's Justice's Manual, page 428, under "Highways—Width and Repair," the following occurs:—"The (District Council) to make, support, and maintain every public cartway leading to any market town twenty feet wide at the least—if the ground between the fences will admit thereof (5 and 6 Will. IV., c. 50, s. 80).

Unless repealed, here seems a rod for obstructive local bodies. Perhaps some legal reader who has the complete Act will explain further. I enclose my card, and remain, Sir,—Yours truly,

A COUNTY J.P.

PREVENTING SIDE SLIP.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The idea of Mr. E. S. Woolf in your last issue is clever but open to objection.

For instance, a gentleman would prefer that mechanical street cleaning be performed by the proper persons—the authorities; but the greatest objection is that, like every side slip preventing device, it is a tinkering with an effect, instead of righting of a cause.

Why not tackle the wrong principle of driving the rear wheels, transfer the drive to the front wheels, and where is side slip?—Yours truly,

ALF. C. WRIGHT.

tage that it does not show the signs of its use on a wheel as the hide gaiters do by wearing off the paint. The sections cannot slip or get lost in running as do gaiters, for the greater the pressure of air in the inner tube the tighter are they fixed. I am sure the method I describe will effect a great saving in cover troubles, and that M. Paul Meyan will find this way a much better one than that which he suggests.—Yours truly,

W. G. CORKE.

THE HORSE POWER QUESTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In looking through the list of entries, in the recent 1,000 miles car trials, one cannot help noticing the difference in the cylinder capacity of the various cars as compared with the reputed h.p. For instance, a car with a single cylinder engine of 100 by 120 mm. is rated as 9-h.p., while a car with four cylinders, each 100 by 130, is rated as 14-h.p., whereas, reckoned on the same basis, it should be nearer 40-h.p. (a slight difference). Again, a single cylinder engine of 88 by 110 is entered as 6½-h.p., while a car with four cylinders, each of precisely the same size, is rated as 12-h.p., instead of 26-h.p. (by comparison) and yet another car with only two cylinders the same size (obviously half the power) is listed as 16-h.p. Two other cars with two and four cylinders (each of the same size) respectively are given as both developing the same h.p.

Does this not prove that the present system of calculating the horse-power is absolutely ridiculous and misleading? Why does not the Automobile Club establish a standard of h.p. calculated on the basis of cylinder capacity, and insist on all manufacturers advertising the h.p. on these lines?

Taking the average cylinder capacity of the cars run in the 1,000 miles trial, it will be found to be 183 cubic centimetres per h.p., yet one car has a capacity of only 103 cubic centimetres per h.p., while another shows no less than 415. Obviously the purchaser of one is not getting full value for his money, while the purchaser of another is getting a monster in disguise. Would the purchaser of a reputed 12-h.p. car, buy it if he knew it to be nearer 40-h.p.

The calculation of h.p. should be based on a cylinder capacity of 175 to 200 cubic centimetres per h.p. The power thus arrived at could be described as theoretical horse power (t.h.p.), capacity horse power (c.h.p.), or some other suitable term, to distinguish it from brake, indicated, or nominal h.p. If this standard were adopted by the Automobile Club and they were to recognise no other terms of power calculation, it would soon come into general vogue, and I am sure it would be to the advantage of both manufacturer and public alike. It would also tend to induce manufacturers to turn their attention to reducing weight and introducing more efficient means of transmission, so as to get the best out of their cars for a given amount of power. As it stands at present, if a maker finds his cars are too heavy, or his gears absorb an abnormal percentage of power, he has only to understate his horse power, and thus have a reserve of power to overcome these delinquencies, and still he develops his nominal horse power at the road wheels. Thus, one maker may have a 12-b.h.p. engine and get 10-b.h.p. at the road wheels, while another maker may have an 18-b.h.p. engine and only get the same b.h.p. (10) at the road wheels, through inefficient transmission, but the best maker, by understating his h.p. and calling it 10-h.p. gets the pull over the first maker who correctly states his h.p. as 12.

Now if some new standard were established, based on cylinder capacity, as suggested, and only this standard recognised in all races, hill-climbs, trials, etc., it would be much fairer all round.

Some such reform as this is greatly needed and should be introduced at once, before the automobile industry assumes too large dimensions to be dealt with.—Yours truly,

DOUGLAS S. COX.

MOTOR HANSOMS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Recently there was considerable publicity given in the newspapers as to a fleet of fifty motor hansom cabs being placed on the streets of the metropolis. Some cabmen were alarmed somewhat, but the older whips were not disturbed, for the report is one that every now and then causes a flutter of excitement in the press. We are still waiting for those hansom cabs, which would enable us to leave the barricades with which some of the main arteries of traffic are now disfigured and get to our destinations by bypaths and narrow ways.—Yours truly,

WAITING.

OUTER COVERS FOR TYRES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your last week's issue you give a paragraph under the title of "A New Use for Old Tyre Covers," in which is described the experiences of M. Paul Meyan during his automobile tour through Italy, and the device he adopted of protecting his outer covers by fixing over them other outer covers of larger dimensions. We beg to inform our readers that this device, to which we have given the name of "Upper Covers" which are securely held by "Upper Rims," is one of the Wilkinson patents, and is the property of our company.—Yours faithfully,

THE WILKINSON TYRE AND TREAD CO., LIMITED.

MR. W. E. HUDSON writes:—From letters in previous numbers of your paper, I notice complaints are made of excessive charges for replacements of parts of cars. As generous treatment by firms is worthy of recognition, I should like to state, for the benefit of others, my contrary experience of the Swift Motor Company. Whenever I have occasion to write them, any parts required are sent off promptly, whilst the charges are most moderate.

THE COASTWISE CARRIAGE OF PETROLEUM SPIRIT.

THE Marine Department of the Board of Trade has recently issued the following notice to shipowners and shipmasters:—

"The Board of Trade are advised that petroleum spirit gives off a highly inflammable gas at all times, and that the holds or vessels in which it is stowed become quickly charged with an explosive atmosphere which passes by diffusion through wooden bulkheads into the adjoining spaces below deck, and that any light or fire coming into contact with this atmosphere will cause an explosion probably attended with disastrous results.

The owners and masters of vessels carrying petroleum spirit should therefore take special precautions against smoking and the use of lights or fire of any kind when the cargo is being loaded and unloaded, or while the hatches are off or any deck openings are uncovered, and they are reminded that the risk from the inflammable nature of the cargo does not cease when the loading is completed, but continues during the subsequent voyage of the vessel.

Attention has also been called to accidents which have occurred to certain vessels engaged in carrying petroleum spirit in wooden barrels coastwise, and the Board of Trade are advised that, in order that this trade may be carried on with greater safety, the following regulations should be observed:—

(1) In all ships, except those which are specially built for the carriage of petroleum spirit, it should be contained in metal packages of a suitable character, such as steel barrels or drums, instead of in the wooden barrels at present largely used for the purpose.

This regulation will not apply to consignments of the spirit when carried as a deck-load and so stowed as not to come within the meaning of "improper loading." In such cases care should be taken that the barrels are in good condition.

(2) The holds of vessels carrying the spirit should not be ventilated by removing the hatches during the voyage. Proper ventilators should be fitted, extending to the bottom of the hold, and these should have large cow heads, the openings being covered with fine brass wire gauze. All ventilation in the crew spaces should be carefully attended to and kept open.

Petroleum spirit cannot be carried without danger in wooden vessels or barges having forecastles or other cabins below deck, it being impossible to ensure that wooden bulkheads will be impervious to petroleum vapour, as they are always likely to allow this vapour to penetrate to the space beyond, especially in dry weather.

It follows from the above that only iron or steel vessels and barges should be used for the carriage of this cargo, and that they should be fitted with perfectly water-tight bulkheads without any openings. Where, however, there are bilge sluices in the bulkheads, these should be kept closed as long as any petroleum is on board the vessel.

The above regulations refer to petroleum within the meaning of the Petroleum Acts, and therefore include any liquid which is produced by distillation from petroleum, shale, or coal, and flashes at a temperature of less than 73 deg. F. as ascertained by the first schedule to the Petroleum Act, 1879, such as benzoline, gasoline, petrol, naphtha, petroleum spirit, lythene, etc., etc."

CLUB NEWS.

WOLVERHAMPTON.

ON Saturday the Wolverhampton Automobile Club had a run to Newport under the captaincy of Mr. T. Cureton. On the 24th inst. a hill-climbing competition will be held at the Hermitage, Bridgnorth.

YORKSHIRE.

THE first smoker of the winter season of this club was held on Thursday week last, at the new headquarters, Great Northern Hotel, Leeds. The trophy presented by Mr. Kirk, and the cup given by Mr. Winn to the club for competition amongst the members were much admired. The former was won by Mr. Walter Jackson and the latter by Mr. E. Faiers, at the recent speed trials at Wentworth Woodhouse. Gold medals were also presented to the drivers of the first and second cars in each class.

SHEFFIELD AND DISTRICT A.C.

ON Saturday the Sheffield and District A.C. spent a most enjoyable afternoon at Sickleholme, where they happened on a party of influential

A Sign of the Times. "Please, I want a copy of 'The Motor-Car Journal,'"

Derbyshire gentlemen, who, evincing great interest in the bigger vehicles, were taken for several short runs. Amongst the members driving cars were Messrs. E. F. Coupe, 24-h.p. Darracq; J. H. Pickford, 10-h.p. Wolseley; W. Watts, 6-h.p. Humber; Jas. Barber, 12-h.p. Belsize; J. E. Evans, 12-h.p. Darracq; S. E. Fedden, 6-h.p.; A. F. Fletcher, 3-h.p. quad; J. T. Thompson, 3½-h.p. Humber; T. G. Revill, 4-h.p. Boyer; Brook Shaw, 6-h.p. De Dion; Percy Thompson, 8-h.p. M.M.C. The motor-cycle section was represented by Messrs. A. T. Dewhurst, W. James, and F. B. Cawood (hon. sec.).

* Indicates Motor-Cycle Cases.

At the West Riding Court, Frederick G. Smith, of 420, Glossop Road, Sheffield, was summoned for driving a motor-car at a rate exceeding twelve miles per hour, on the 24th September. On that date defendant was seen by Police-sergeant Bellis driving a motor-car between Moscar Top and Sheffield, and coming in the direction of the latter place. Bellis timed him, and upon discovering that he was travelling at a higher speed than twelve miles an hour, he ordered him to stop, and defendant complied. Defendant admitted travelling over the speed allowed, but explained that he did so because there was a straight road before him and no traffic was near. The Chairman remarked that it was only a technical offence, and defendant would be fined 7s. 6d., inclusive of costs.

Mr. F. E. E. STWOOD, the Chairman of the Woking County Bench, has declared that the local magistrates place full reliance upon the timing of motorists by the well-known Sergeant Jarrett.

GEORGE WESTALL, engineer, of Shepherd's Bush, was summoned at Epsom for driving a motor-car on the Leatherhead Road, Chessington, at a greater speed than twelve miles an hour, on August 30th. P. C. Knappe and another constable said that defendant covered a quarter of a mile in

thirty seconds, a rate of thirty miles per hour. Defendant called two motor experts to prove that the car was a slow one, incapable of travelling at a higher possible rate than fourteen or fifteen miles an hour. The Chairman afterwards said that, in the face of the expert evidence, the Bench felt they must dismiss the case. The police no doubt acted to the best of their judgment, but probably made a mistake.

Mr. F. B. ARMSTRONG, summoned for driving a motor-car to the danger of the public, at Liverpool, offered a novel defence. Police-constable Connell stated that in Renshaw Street on the 1st inst. the defendant drove a motor-car in a manner that was to the public danger. He did not keep to his proper side of the street, and, passing an electric tramcar on the wrong side, knocked down the tramway pointman. Mr. Armstrong said he was receiving lessons in motoring from an expert, who was in the car with him at the time; and it was in obedience to the expert's orders, in consequence of another car being in the way, that he took the side of the street he did. He was going very slowly. Alderman F. Smith said it was a very serious thing to knock down a man with a motor-car, and the bench must mark their sense of the defendant's error of judgment by imposing a fine of 5s. and 4s. 6d. costs.

A FURTHER sequel to the hill-climbing contest which took place at Sunrising in August has been the hearing at the Stratford County Police Court of cases against motorists, when Mr. Albert E. Crowdy, of Birmingham, was fined £2 and cost for driving over twelve miles an hour. The adjourned case against Mr. T. E. Aveling, of Birmingham, hon. secretary of the Midland Automobile Club, was also taken, Police-sergeant Street stating that they were going over twenty-five miles an hour. Mr. Johnson, for the defence, said the police had made an error, and had timed another car instead of theirs. Defendant said the gear lever was at the second speed, and with both cylinders running the car could not do more than 15½ miles. Mr. Jones said the evidence was so conflicting that the case would be dismissed. The magistrates did not impute bad motives to either side, but a mistake had been made.

POLICE TRAP.

In the village of Theale (Berkshire) the police have a carefully devised trap, in which they succeeded in making a good haul a few days ago.

CLAIM FOR DAMAGES.

At the Coventry County Court, Mrs. Cleaver has claimed from Sandell Stevens, of Earlsdon, £20 as the value of a King Charles spaniel, which was said to have been run over by the defendant's motor-car in Queen's Road on August 11th. The jury thought the defendant guilty of negligence, and assessed the damages at £5, for which amount judgment was entered.

LORD BALCARRES, M.P. for the Cherley division of Lancashire, who is seeking re-election on his appointment to the Government, is visiting his constituents on a 10-h.p. Cottareau car, being driven by Mr. H. H. Timberlake, a Wigan motor agent.

FROM the Gordon Motor and Cycle Company comes a neatly-got-up booklet descriptive of the "Gordon Miniature" car they have recently introduced. This is a little two-seated car fitted with 6-h.p. engine and two speeds, which has been produced to meet the demand for a popular-priced vehicle. Illustrations are given showing the general arrangement of the chassis and the outward appearance of the car.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

COMMENTS.

THE provincial automobile clubs are likely to play an important part in the development of the industry and the popularisation of the pastime. They have maintained useful programmes during winter and summer months and are as representative of the motorists of the various localities as they well can be. Hitherto they have borne the strain of affiliation with the A.C.G.B.I. without much demur, but it is now felt that the trend of opposition will be from the central to the local authorities and that they will have to preserve a more defensive front in their own districts. This view has been steadily coming to the front and now finds voice in a circular letter issued by the Reading Club.

The Reading Club takes the Initiative.

THE Reading Club has been considering the advisability of affiliation with the Automobile Club of Great Britain and Ireland, and a special committee was appointed to deal with the question. After most carefully weighing the *pros* and *cons*, that committee came to the conclusion that the fee required for affiliation (10s. 6d. per member) would be too great a strain upon the resources of the club, and that, therefore, affiliation, though desirable from many points of view, is impossible. There is no doubt, however, that some sort of union amongst the ever-increasing number of automobile and motor-cycling clubs in the United Kingdom would be most desirable in the interests of the sport, and it was felt by the committee that there is probably a large number of provincial clubs which feel the same difficulty on the question of affiliation as the Reading Club, but which would welcome an association of provincial clubs formed for the purposes of mutual defence and generally promoting the interests of provincial automobilism. It was thought probable that such an association could be readily formed, which would combine all the advantages of affiliation to the A.C.G.B.I., but at considerably less cost, and at the same time become an influential and independent body.

The Scheme of Management.

THIS idea was brought before the members of the Reading Club, and on the proposition of the president, Dr. J. H. Walters, it was decided to bring the matter before all the provincial automobile and motor-cycling clubs and ascertain their views regarding the feasibility of forming an association of provincial clubs for the purposes of mutual defence and promoting the interests of provincial automobilism generally. Already a suggested scheme has been outlined by the Reading Club for the proposed Automobile Federation. The central committee would be composed entirely of nominees of the federated clubs.—(a) One third of the members of the central committee to retire each year in rotation, but be eligible for re-election. (b) The central committee would appoint the officers of the Federation and undertake the general management of the Federation. A central defence fund would be created and members and associates would be given the advantages mentioned in the following paragraph.

Possible Advantages.

EACH federated club will have entire control of its own affairs, and each federated club would have equal voice in the management of the Federation. The expenses of the administration of the Federation would be comparatively small that no central club-house, with its attendant outlay, necessary. Members and associates might have access to the club-rooms of any of the federated clubs, subject to the rules of such clubs. Subscriptions paid by associates would be sent direct to the central committee, and would very considerably augment the central fund. In districts not represented by a federated club, associates, selected by the central committee, might act as district consuls. Arrangements could be made with hotel-keepers, and others, for securing advantageous terms to members of the Federation. A Federation trophy might be acquired and competed for by a team selected from each of the federated clubs.

Reform in Ladies' Automobile Attire.

THE American National Milliners' Association recently held its annual meeting in Chicago, and occupied itself with the subject of ladies' automobile dress. One of the delegates, Madame Hunt, sought to create a sentiment for more æsthetic and fitting designs. According to her views, the articles at present offered to fair automobilists at milliners' and department stores may serve the purposes of long country trips, but are unsuitable for drives in the city—for shopping, visiting, or pleasure riding. Articles of dress intended for the last-mentioned purposes should be of such a nature as to admit of the wearer attending an afternoon reception immediately upon alighting from the car. This condition excludes all long flowing veils. Madame Hunt considered that light close-fitting silk hats projecting sufficiently to protect the eyes should be worn, and coats which would look as well when walking along the street as when sitting in the car.

The Biograph at the Club.

THERE was a "crowded house" at the A.C.G.B.I. on Thursday last week, when the winter season was inaugurated by a house dinner followed by a Biograph display. The programme of the latter was of a most varied character, ranging from "An Imaginary Love Scene" (which, by the way, was coloured), to the more serious and instructive subject of "The Launch of the Oceanic." A series of pictures of the Gordon Bennett race in Ireland was set down as the *bonne bouche* of the evening; but, while these brought back memories of an exciting day to many of the members who spent July 2 at Ballyshannon and the Moat of Ardscoil, and gave a realistic representation of the race to others who were not able to visit the Green Isle, the interest of the evening was undoubtedly centred in the reproduction on the Biograph of the thrilling exploit of Capt. Deasy in ascending and descending the Rochers de Naye along the cog railway. The pictures, which came altogether as a surprise, and testify to the enterprise of the Biograph Company, were most realistic. The descent seemed, if possible, a more daring task than the

ascent, and it made us shudder, as we anxiously watched the car slowly descending the steep grade. Curiously enough, Capt. Deasy was among the audience, and thus was able to witness the performance from the point of view of a spectator. At the conclusion of the Rochers de Naye pictures there were calls for Capt. Deasy, who gave a brief but thrilling account of his feat. He explained that the car—a 14-h.p. Martini—was fitted for the event with 9-tooth sprockets in place of the usual 11-tooth wheels, and that to satisfy the officials of the railway line an unusually large sprag was carried. As to the gradient, three kilometres of the route are about 22 per cent., and on this the car was stopped and successfully re-started. Altogether the opening meeting of the winter season was a pleasant and enjoyable function.

A Judge as Expert.

SIR ALFRED COOPER, a Surrey J.P., who has just been caught by Sergeant Jarrett in one of his specially devised traps for motorists, does not seem to have a very high opinion as to the methods of the police upon whose evidence he and his fellow magistrates are often asked to convict gentlemen who are doing no harm to the community. Were every J.P. a motorist, we should have more common sense pronouncements from the bench, and that there is something in the idea that

he car, and, with Mr. Egerton driving, left for Ipswich at 5.21. Whilst daylight lasted the pace was strong, but slackening down as darkness fell, the car brought its freight up to the station at 6.19, well in time for the Norwich train.

A Scotch View.

At the statutory monthly meeting of the Inverness-shire County Council, the Road Board reported that it was not expedient to exclude motor-cars from county roads, but that the Secretary for Scotland should be petitioned to frame by-laws for the protection of the public using these roads, and in particular that a by-law should be passed to the effect that a car must be stopped on the driver of any horse or vehicle, or the driver of sheep and cattle, holding up his hand to indicate his wish that the car should be stopped, and the Board recommend to petition the Secretary accordingly. Lord Lovat, who moved the adoption of the report, reminded the Council that the "up hand" clause had been introduced into the new Act by the House of Lords, but that it was deleted by the House of Commons. He thought, however, that the Secretary for Scotland had power to add a by-law to the effect proposed applicable to individual counties. The recommendation of the Road Board was approved on the principle that "there was no

The Anniversary Run of the Western Section of the Scottish Automobile Club. The Scene at the Start.

only practical men should adjudicate in motor-car cases is suggested by a remark of Judge Emden at the Lambeth County Court the other day. A man had claimed damages for being knocked down by a motor-car, when the judge remarked that in view of the extremely high feeling against motorists, he wished to state that he was a motorist himself, and if the plaintiff wished he would facilitate the removal of the action to some other court. The plaintiff's counsel said that he had no desire to remove the case, whereupon Judge Emden added that, as a matter of fact, he found his knowledge as a bicyclist and motorist very valuable in deciding street accident actions generally.

Football and Motoring.

THE players engaged on the side of the visitors in a football match at Dovercourt, the other day, between the Harwich and Dovercourt Club and the Norwich City Club, discovered during the afternoon that the train service between Harwich and Ipswich and Norwich did not admit of their getting home that night unless they left about the same hour as the match was to begin. The idea of a motor-car suggesting itself, a telegram was dispatched to Messrs. Botwood and Egerton, at Ipswich, in response to which Mr. Egerton himself set out about four o'clock, and reached the field in time to see the conclusion of the game. After "changing" at the hotel, three of the footballers mounted

harm in asking" the Secretary for Scotland to frame a by-law of the nature desired, and the Special Roads Committee was instructed to make arrangements for putting the new Motor-Car Act into force.

No Stop Watches in West Suffolk.

At a meeting of the West Suffolk Standing Joint Committee, at Bury St. Edmund's, on Monday, presided over by Col. Barnardiston, a recommendation was received from the chief constable (Capt. Metcalfe) that a dozen stop watches be purchased for the police, in order to facilitate the watching of motorists, at an estimated cost of ten guineas. Col. Boyd C. P. Hamilton said he hoped the police in West Suffolk would not have put upon them the degrading office of watching motorists. It was a perfect disgrace that a police officer should hide himself behind hedges. It was un-English in every way. He moved that the matter stand over. Mr. Elliston Allen thought the matter might be postponed till the Act came into force in January. Mr. O. D. Johnson agreed with this, but said he did not think it should go forth that as a committee they deprecated the action of the police in detecting breaches of the law, whether the breaches were committed by those in high places or in low. While the law was in existence in the land it was the duty of those appointed to administer the law to administer it. He thought

the committee should be careful in matters of that kind. Mr. L. Marshall said whether there was a law for the rich and another for the poor, he did not see why the police should spend their time in looking after motor-cars. The matter was allowed to stand over, as suggested.

Mr. E. L. Cooke's Case.

WE understand from Messrs. Firth and Company that Mr. Cooke has taken counsel's opinion as to whether he could proceed against the Justices of the Peace for York, for the high-handed way in which they treated him in his case, for an alleged technical infringement of the Light Locomotives on Highways Act, 1896, for exceeding twelve miles an hour. He was fined £10 and costs, or two months' imprisonment. Mr. Cooke was so disgusted at this decision that he declared that he would rather go to prison than pay it. He accordingly refused to pay it, and ultimately a warrant for his arrest was issued and he was imprisoned. Counsel's opinion has been taken, from which it appears that the Justices have not committed themselves to an action.

Road Repairs.

THE season is now approaching when extensive repairs will be carried out on the various highways, and, for the benefit of traffic in general and for motor-cars in particular, it would be beneficial if some signal was placed at night at each end of a piece of road that is under repair, in order that drivers might reduce the speed of their cars and possibly prevent damage to the tyres. Mr. S. Towson, A.M.I.C.E., the district surveyor for Sevenoaks, has for some years placed a lamp showing a red light on the nearest street lamp posts at either end of a length of road under repair, and when the signal is known by drivers they are very glad of the warning. The defect is that the red lights are not general and a stranger coming along would not know the meaning of the signal. If the matter could be taken up and every District Council be induced to give the warning, the drivers and owners of many vehicles would be benefited thereby.

Railways and Motor-Cars.

THE conversion of the Great Eastern Railway Company to automobilism is a notable sign of the times. We are officially informed that the directors have decided to establish a motor-car service between Lowestoft and Southwold, a significant development in view of the complaint of Lord Claud Hamilton, the chairman, at the last half-yearly meeting, as to the effect of the competition of motor-cars and electric trams in reducing profits. Railway directors will have to recognise that the automobile should be regarded as an important accessory to their prosperity, and not as a competitor to draw away dividends. Evidently the leading railways are recognising this fact. The other day we noticed the business agent of the London and North Western Railway employing an Oldsmobile in the execution of his official duties in South London, and previous record has been made of the enterprise of the North Eastern and the Great Western Railways with regard to automobiles.

The Lighting of Vehicles.

At the last meeting of the Renfrew County Council Mr. H. R. Peite said the Roads Committee, when considering the operation of the new Motor Car Act, should also deal with the entire question of the lighting of vehicles at night. For instance, there were carriers' carts which, under the present regulations, did not require to carry lights. Those cars had often, as part of their freight, long bars of iron for country smithies, which projected behind the carts and formed a dangerous obstacle to anyone driving up behind them. Then the committee should also consider carefully what regulations they thought should be enforced regarding the lighting of motor-cars. As the law at present existed there was nothing to pre-

vent these "fiery articles" from going at a less speed than twenty miles per hour, even at night, and with the lights they carried and the speed at which they went such vehicles were very apt to startle passing horses. The whole question of the lighting of vehicles needs careful consideration.

The Act in Hampshire.

WE congratulate Mr. A. L. Stent on securing the passing of a resolution at the last meeting of the Havant District Council excluding the Emsworth road from a resolution of the Roads Committee which would have practically brought the whole of the roads in the district within the operation of the ten mile limit. The rural councils, however, seem to be going to extremes, and miles of the finest roads in the county of Hampshire are likely to be brought within the restriction. It is rumoured that the Corporations of Bournemouth and Portsmouth will probably adopt a less restrictive and more sensible policy.

"Rich Loafers" (see last issue, page 629.)

Hedge to Hedge.

LAST week we were able to announce that the Local Government Board had decided that the measurement of the highways in connection with Clause 8 of the Motor Car Bill should be made from hedge to hedge and not across the roadway. This will settle much confusion that has arisen in the minds of motorists, and we suppose they must be thankful even for this small mercy. Measuring from hedge to hedge will prevent local authorities throughout the country closing many of the roads they had in view for such prohibition, and in the fens of Lincolnshire as well as some of the uplands of Surrey will enable motorists to travel in districts which, it was feared, would be closed to their use.

The Passing of the Amateur.

THE abandonment by the Automobile Club of the annual anniversary run in November is a matter of some interest, both to amateurs and the trade. Since 1896, when, on the occasion of the run to Brighton in celebration of the passing of the Light Locomotives Act, Mr. Hewetson on his Benz car was among the first to arrive at London-by-the-Sea, these annual events have been matters of importance. To a large extent the trials taking place in the autumn have lessened the interest in the November run, and the growing proportion of traders taking part has necessarily restricted the entries of amateurs. This is a natural trend of the time, and has been evident in America as well as here. The first Endurance contest in America, in 1901, was mainly supported by amateur motorists, but

these have all disappeared from the programmes of later events, which are now entirely monopolised by members of the trade. Those who participated in the early tours of the Automobile Club in this country will regret that the growth of the movement has prevented their continuance on the old lines, for there was a sociability about these pioneer events which has disappeared. Undoubtedly some of those early amateurs look upon later developments with somewhat of a pessimistic attitude, but they must console themselves with the reflection that it is an inevitable consequence of the great development that has taken place in the industry.

Progress in Scotland.

WHILE on this subject attention may be called to the fact that, anticipating the date of the anniversary somewhat, the Scottish Club last week had a celebration of the legislation of 1896 all to itself. In the South of England the prominence that automobilism is assuming north of the Tweed is scarcely appreciated at its full value. Illustrative of this, it may be mentioned that in 1901 there were twenty cars taking part in the similar event, while in 1902 the number rose to fifty. This year that number was augmented to over seventy, the largest gathering of cars yet seen in Scotland. It is also noteworthy that one half of the cars in the run were built in Scotland, while only one-third of the whole were of foreign manufacture. Last week's run, the recent extensions to motor-car works in Glasgow, the growth of automobile agencies in all the leading Scottish centres, and the popularity of the country for touring, are all evidences that Scotland is well to the fore in this matter, and that the suggestion that the Reliability Trials might well be transferred to north of the Tweed, or some centre half way between London and Glasgow, has strong claims to recommendation.

The Future of the Trials.

ON the other hand many leading firms in the trade would favour the abandonment of the trials for say three years. At present makers have to carry on business with one eye on the forthcoming trials. This is said to be a disturbing factor in the consistent organisation of production. If there were a lull in the trials, the technical experts would have time to seriously consider many points that have yet to be settled before the industry attains that stability we all desire. Then, too, trials at intervals of longer periods than twelve months would give opportunity for more valuable comparisons as to progress made, and would enable the trade to thoroughly test by longer experience the types of machines now in type.

Every Three Years.

THERE should be no difficulty in effecting an arrangement of the Trials on lines such as this:—One year, the trials of motor-cycles should take place; the next, those for delivery vans; and the third year, those for pleasure cars. In this way much of the overlapping that must inevitably result from too frequent trials will be avoided, while makers will have an opportunity of specialising in whatever department seems best from their own points of view. The subject is one of importance as well as interest to the trade, and the opinions of readers will be welcomed.

Motor-Cars in Winter.

THOSE automobilists whose experience does not yet include winter use of their vehicles will probably welcome a few remarks on the special precautions necessary in their operation during the next few months. Carelessness in leaving steam and petrol vehicles exposed to freezing temperatures with water in tanks has been the cause of much annoyance, and users are especially liable to suffer from this trouble at the beginning of the cold season, when a sudden drop in temperature often comes unexpectedly. In petrol vehicles the cracking of the engine

cylinders is the most serious result of this oversight. With steam cars the piping and tanks are sure to burst if the water is allowed to freeze. In the case of petrol vehicles an efficient method of preventing the water from freezing at temperatures below the freezing point is to add glycerine, although some motorists consider that calcium chloride is preferable. Steam carriages must not be exposed, when not in use, for any length of time to freezing temperatures. When left in the stable either all the water must be drawn from the tanks or else the stable must be heated, the latter being probably the method most generally employed by steam-car owners. At periods of extreme cold lubricating oils have a greater viscosity than during the warm season, and to feed the oil at the same rate requires, therefore, a greater opening of the lubricator.

The Future of the British Trade.

ON Friday of last week a number of well-known motorists met Mr. S. F. Edge at a pleasant dinner at the Trocadero Restaurant. Responding to the toast, "Success to British Motoring," proposed by Earl Russell, Mr. Edge observed that England is the greatest market for automobiles. The imports of foreign motor-cars to the end of September this year were valued at £1,600,000, an equivalent of 5,330 vehicles at £300 each. He looked forward with confidence to the time, not far distant, when, instead of paying the foreigner a million and a half for their motors, we should be receiving perhaps ten times that amount from them for ours. On the subject of racing, Mr. Edge defended the Gordon Bennett and similar contests. They had, he said, played an indispensable part in the evolution of the perfect car, forming a practical object-lesson to the manufacturer, and it was a singular fact that the three greatest makers of automobiles in the world, French, German, and English, had each won the much-discussed Gordon Bennett race.

MESSRS. MILNES-DAIMLER, LTD., are removing to 221, Tottenham Court Road, W.

THE Automobile Club of Saxony and Thuringia has just been formed at Zwickau, Saxony.

THE Highways Committee of the L.C.C. is preparing a report on the Motor Car Act.

MESSRS. CLARKSON, LIMITED, have just completed a sixteen-seated steam omnibus for service at Torquay.

MR. T. H. HOLDING will hold a special exhibition of his motor garments at his show rooms on Tuesday next.

WE understand that the hon. secretaries of five provincial automobile clubs have already promised favourable consideration to the proposal of the Reading Club, referred to on page 647.

WE learn that the Auto-Cycle Club has now definitely decided to adopt two racing standards for motor-cycles for the year 1904. After much discussion it has been decided to abandon the weight limit classification in favour of cylinder capacity. The new standards will be as follows:—Class A: motor-cycles, the engines of which have a cylinder capacity of not more than about 269½ cubic centimetres, or the equivalent of 70 mm. bore by 70 mm. stroke; Class B, motor-cycles the engines of which have a cylinder capacity of not more than about 344½ cubic centimetres, or the equivalent of 76 mm. bore by 76 mm. stroke.

THE municipal authorities of the city of Mexico have lately passed a new and somewhat severe ordinance to regulate the operation of motor-cars in the federal district of Mexico. First of all, there is a monthly tax or license fee of 8s. to be paid. Then, on making application for license, the owner of the car must furnish two personal photographs, one of which is fixed to the license certificate for purposes of identification and the other filed away by the city authorities. Finally, an examination has to be passed, and the applicants must be pronounced competent mechanics before a license is issued to them. It will be apparent that the monthly fee makes automobilism a very expensive pastime in Mexico.

CARS, PAST AND PRESENT.

BY MRS. KENNARD.

EVER since we first kept a motor-car, about five years ago, it has been our custom to run up to Scotland on it every autumn. Good old "Sir Charles" of 1,000 miles Trial fame has accomplished the journey repeatedly. In the early days, Mr. Napier's first creation was considered a veritable flier, but speed is purely comparative and a matter of habit. Latterly, in spite of her sturdy qualities, we designated her "a poor old slug." The car weighed over twenty-five cwt. and the engines were only 8-h.p. Although they performed prodigies, our pace uphill was often reduced to a crawl. It took from three to four days to do the journey of 365 miles, and even then it meant being many hours on the road.

This year we became the proud possessors of a 12-h.p. four cylinder Napier, and early in September we set out for the north, anxious, if possible, to make a good run. The start was auspicious, the day proving fine, the roads in fair condition. We left our home near Market Harborough at 8 a.m. and by ten minutes past twelve were filling up at Doncaster. The car had virtually averaged twenty-five miles an hour for her first hundred miles, and this included slowing up for cattle, sheep, vehicles, towns, and police traps, of which there were several *en route*. It was an absolute non-stop run. After taking in six gallons of petrol we started afresh, and when clear of Doncaster made a very excellent picnic lunch by the roadside. After half-an-hour's delay, we once more pursued our journey north, and did not pause until nearly 5 p.m., when the pangs of hunger called for a halt of a few minutes, during which we gladly disposed of the remains of the earlier meal. By 6.30 we found ourselves in Morpeth, and here we decided to put up for the night, having done 235 miles in the day with the greatest of ease.

We arose the following morning to find torrential rain descending. Grey were the skies overhead, and black the roads underneath. Never did motorists gaze at a more doleful scene of desolation. The weather was simply appalling. We looked and shuddered; dressed, breakfasted, and shuddered again. But my husband decided to push on, and we arrayed ourselves for the fray—or rather deluge. And a deluge it certainly was; pitiless, pelting, persistent. But to the gallant car the ungracious elements seemed to matter little. She climbed the steep slopes out of Alnwick in quite light-hearted fashion, swept swiftly on to Berwick-on-Tweed, and from thence to Cockburn's Path, which mountain pass was not rendered pleasanter by a dense sea fog in addition to the rain. At Dunbar, three dripping, cold and shivering objects presented themselves at the hotel for refreshment. So wet were we that the waiters eyed us askance as we stood and poured little rivulets upon the flagged hall. At Edinburgh the rain was still descending with merciless severity. For hours I had been sitting in puddles, and every few minutes, at this stage, a fresh trickle developed itself. Down one's neck, through one's pockets, into one's boots. Phew! it was motoring with a vengeance. Thanks! infinite thanks to Charles the Second, who landed us at our destination in Falkirk at 4.30, having accomplished 365 miles since the previous morning.

The homeward journey, undertaken a week later, was destined to put the motor to even a still more severe test. No words can describe the weather. Rain, wind, hail were the daily accompaniments of our rides. The roads were in an awful condition. We stayed a couple of nights with friends near Carlisle, and then set our faces south, travelling via Bothell, Grasmere, Thirlmere, Windermere, Ambleside, and Keswick.

Beautiful as the scenery no doubt was, we saw next to nothing of it. There was snow on the hills, mist in the valleys, furious squalls of wind in the passes, and rain, rain, rain and floods everywhere. The water flew up in fountains from our front wheels, and we were drenched to the skin. Even the trickles disappeared in one vast wetness. Many of the gradients were exceedingly formidable. It took a good car to climb the hill out of Keswick, with chains all stiff and belogged with mud. It is at such times and such seasons that the motorist offers up a

prayer of thankfulness to the makers of a really good vehicle. On, steadily on, went Charles II., battling bravely with the unkind elements, which seemed to have combined to bar his progress. Stoutly and swiftly he disdained them, never halting, until he pulled up for the night in the yard of a comfortable little hostelry at Skipton. He had defied every hill encountered and flung the steep Buck a Brow to the rear with consummate ease. We were the envy of an unfortunate fellow motorist, whose car had failed on the previous afternoon to climb the long and steep ascent out of Keswick. The next day meant home, and we were up betimes, only to find water the predominant note of the surrounding landscape. Never was there such a mockery of a summer. The roads around Keighley and Bradford were in an indescribable state of grease. The car could only be driven by throwing the clutch in and out, and any attempt at braking or high speed would instantly have courted disaster. Our progress was necessarily somewhat slow through this thickly-populated district. But, after reaching Wakefield, matters improved considerably, and we were able to bowl along to East Retford in fine style. After leaving that town, however, a storm of malignant severity overtook us. It accompanied us for the remainder of the journey. The following day the papers were full of the unprecedented gale, the stupendous rainfall, the vast amount of damage inflicted by land and sea. Dover Harbour was partly demolished, and the harvest practically ruined. Charles the Second never

Mr. and Mrs. E. Kennard on "Charles the Second."

finched in the face of the cyclone. Bespattered, bedraggled, converted into a sea of mud, his colours indistinguishable, his trimness, symmetry and beauty totally obscured, to his honour be it said, he forged ahead, true and trustworthy throughout the most trying tour the writer has ever taken part in or hopes to take part in again. The wind raged, the rain descended with tropical violence, so thick, so fierce, so fast, that the driver had to shield his face with one hand and steer with the other. It out the skin like knives. But, amid the general discomfort of our surroundings, the marvellous reliability of the modern motor-car stood out as a fact more and more firmly impressed upon the mind. In olden days, non-motorists used to say with a sneer, "Do these things always go wrong?" The query will soon resolve itself into, "Do they ever go wrong?"

Engines have been brought to a pitch of perfection hard to improve upon. Every year more care is being bestowed upon details by manufacturers. Brakes, gears, ignition, are all receiving a fair share of attention. There remains but one weak spot. Tyres alone deter the general public from boldly adopting the horseless vehicle as one of utility rather than pleasure. When the costly pneumatic is superseded and side-slip eliminated, then the star of the automobile will shine brightly and without rival. In time, human brains overcome all difficulties; sooner or later they will conquer these to a certainty. The cars of five years ago and the cars of to-day prove what man can accomplish and where he still must seek perfection.

D

THE 5-H.P. "HUMBERETTE."

—■—

WE have already published a general view and some brief particulars of the 5-h.p. voiturette recently produced by Messrs. Humbers, Ltd. As considerable interest is being shown in the little car, which appears to be a successful attempt to produce a motor-vehicle at a popular price, we this week devote space to a more lengthy account of its principal elements, the disposition of which is clearly shown in the accompanying illustration, which represents a plan view of the car with the body removed. To begin with, the frame, both the main one as well as the secondary, which carries the engine and gear box, is of tubular construction. The motive power is supplied by a single cylinder vertical motor, developing 5-h.p. at a speed of 1,500 revolutions per minute, the cylinder diameter being 3.5-8 in. and the stroke 3.5-8 in. The engine is placed forward of the dashboard, under a bonnet, which can be thrown back, exposing the engine, carburettor, ignition and water-cooling apparatus, all of which are extremely accessible. The ignition is by accumulators and trembler coil, with a wipe contact maker on the engine. The water tank and radiator are combined, the circulation being maintained by a gear-driven pump. In order to give an indication as to whether the pump is working properly, a tap is provided in the pipe leading from the top of the water jacket to the radiator. On opening this tap, if the pump is in order, a steady stream of water will flow out. The battery and coil are contained in a small box beneath the bonnet, so that they are as near as possible to the engine, thus reducing the wiring to a minimum. The carburettor is a Longuemare, the throttle and air levers of which are controlled from the steering standard. Passing now to the transmission, this is through a clutch gear box, universally-jointed shaft and bevel gearing to the rear live axle. Two speeds forward and a reverse are provided, the power of the engine being transmitted direct on the top speed. The pinions in the gear box are always in mesh. The clutch is of the cone type, covered with leather, so fitted as to prevent end thrust on the engine shaft. The reverse motion is thrown into action by a different lever to that used for the forward speeds, but the mechanism has been so arranged that the reverse can only be engaged when the change speed lever is in the free engine position. The frame of the body is built of tubing, the panels being of sheet aluminium. A roomy seat, giving ample accommodation for two persons, is provided, whilst at the rear, on the platform, and in the whole of the space below the seat, there is an abundance of room for tools, spare parts, and for luggage. On the dashboard is the petrol tank, holding sufficient for a run of 100 miles, and an oil tank carrying half a gallon of lubricant, the feed pump being attached to the tank. The change-speed gear runs in oil, and only requires refilling at long intervals, while four transparent lubricators serve the back axle, bevel, and balance gears. Two brakes are provided—a pedal actuated band brake on the transmission shaft, just behind

the gear box, and a double band brake working on drums on the back axle, operated by a hand lever. The control levers are all grouped round the inclined steering pillar. The Humber single arm steering wheel is employed, so that the levers are particularly accessible, and the control of the car rendered exceptionally simple. A useful provision is made whereby the height of the steering wheel can be adjusted. The wheelbase is 5 ft. 3 in., and the gauge 3 ft. 6 in., the dimensions all over being:—Length, 7 ft. 10 in., and width, 4 ft. The wheels are of the cycle type, 28 in. in diameter, shod with $2\frac{1}{2}$ in. pneumatic tyres. The total weight of the car is about $5\frac{1}{2}$ cwt. It is made in two patterns—the Coventry Humberette, with an undivided front seat, and the Beeston Humberette, with bucket seats, side doors hinged to the dashboard, a governor on the engine, and several other small refinements. On the level the car can attain

a speed of 25 miles per hour, while it has climbed a hill with a gradient of 1 in 9 at a speed of 8 miles per hour. Already large number of these little cars are in use, and in order to facilitate their control and maintenance Messrs. Humber have prepared an exceedingly useful handbook, in which the arrangement of the various parts is clearly depicted, and instructions given as to driving, oiling, etc.

MESSRS. JULIUS HARVEY AND CO. have a further order in hand for a steam motor-wagon for India.

GENERAL FRENCH, who has been shooting in Norfolk during the past week, enjoyed several trips on a 10-h.p. Sandringham car.

A REQUEST by Earl Russell to address the members of the Midhurst Parish Council on the 8th and 9th sections of the Motor Car Act has been declined.

MOTOR-CARS are not allowed in Hyde Park between Hyde Park Corner and the Magazine—a curious restriction to which the attention of His Majesty's Office of Works has been drawn in vain.
